On the bull's-eye targets a series of festival premiums are offered. For the first fifty points made by any shooter, a silver festival medal; for two hundred and fifty points more, a gold festival medal; for every hundred points additional, three trade dollars. He who scores the greatest number of points in the first six hundred shots shall be declared "King of the Festival," and be awarded the king's gold medal and \$50 in cash. For the second most points, \$50; third, \$45; fourth, \$40; fifth, \$35; sixth, \$20; seventh, \$15; eighth, \$10; ninth, \$8; tenth, \$8; eleventh, \$6; twelfth, \$6; thirteenth, \$5; fourteenth, \$5; fifteenth, \$5; sixteenth, \$4; seventeenth, \$4; eighteenth, \$3; nineteenth, \$3; twentieth, \$3.

The firing will open on Monday, June 17, at 2 p. m., and close at 7 p. m. Each succeeding day of the meeting it will begin at 8 a. m., and close at 7 p. m., with an intermission from 12 to 1 p. m. On Saturday the firing and the meeting will close at 3 p. m. A cannon shot will announce the several hours named.

The meeting offers a perfect wilderness of temptation to lovers of off-hand shooting, armed with any class of rifles. The old style hair-trigger weapons will have plenty of earnest patrons, and the modern breech-loader will have opportunities to show its asserted superiority. The Creedmoor men may meet their friends, if not acquaintances, of the Schutzen Bund, and strive in generous rivalry. The FOREST AND STREAM AND ROD AND GUN has exerted its influence to sustain this competitive system, and in offering a medal for off-hand shooting has hoped to bring into the healthful acquaintance of match-shooting our German and American rifle friends. We number thousands of each class among our readers, and it is our earnest wish to see the different styles of shooting intelligently tested, side by side, and in this connection a word on the old ring target is in place.

The Creedmoor target, with its arbitrary divisions, grew out of the exigencies of military practice, where a ready means of signalling was called for, requiring a correspondingly simple system of sub-divisions on the target face; but the finer discriminations are lost, nominal ties are frequent, whereas actual equalities of merit may be very rare. The notion of such coarse marking grew up at a time when it was considered fair to put any sort of a weapon into soldiers' hands. That time has passed, and the problem now pressing for solution on our rifle ranges is the establishment of a system of marking, combining the utmost simplicity with the greatest accuracy, without such cumbersome details as to make it slow in operation. The ring target seems to offer a means for exact measurement and a careful comparison of shots. Whether it will work well at the long ranges and under the severe usage of the heavy practice, such as that held at Creedmoor, remains to be seen; but the problem is solvable, and none will deny that some change can be made to advantage in our present copy of the Wimbledon system.

For the convenience of our readers and riflemen generally, we add a list of the general rules and regulations which will govern the Union matches:

1. Only off-hand shooting is allowed; no shooter is permitted to rest any part of his body against or upon any support.
2. No shooter is allowed to place the butt of the rifle, when aiming, under the coat, vest or suspender.
3. Any fire-arm is allowed, which carries not less than thirty round balls to the pound.
4. Spectacles and simple glasses in the rear sight (globe sight), or upon the stock of the rifle may be used, but must be produced for inspection by the Shooting Committee, when demanded.
5. Only simple supports or gun-holders are permitted.
6. Offences against these rules, when committed in shooting at the Association targets, will be punished by the loss of the shooting ticket, at the other targets with the loss of the shot, and, when repeated, with a fine of one dollar (\$1) in each case.
7. Any one shooting for and in the name of another person, shall lose all claims to prizes, premiums and entry money, and shall be excluded from the shooting-house during the festival.
8. On buying the ticket, every shooter must see that his name and surname, place of residence, name of the rifle club of which he is a member, and the number of his festival ticket are correctly entered.
9. Every shooter on entering any stand of the bull's-eye targets shall deliver to the Warner, before shooting, his ticket and mark; the Warner registers with a punch the number of points shot, just below the registration of the shot. Every shooter, after having made twenty shots on his ticket, is required to give such ticket to the secretary of the bull's-eye targets for registering purpose. Any shooter neglecting such registering has to bear his own loss.
10. Every shooter, after having hit the 2 1/2 inch bull's-eye on

the bull's-eye targets, must enter in the Warner's book his name and the number of his festival ticket.

11. The Warner alone has a right to pull the bell. All tickets must be delivered to the Warner before shooting.

12. Every shooter must satisfy himself that the result of his shots is correctly entered; errors must be at once corrected by the Shooting Committee; no claim on the ground of error is allowed, when deferred to a later period.

13. The cap must not be put on or the cartridge put into the chamber before the shooter gets himself ready to fire; in so doing he must point the muzzle toward the targets; in the shooting-house the rifle must be carried, under all circumstances, perpendicularly, the muzzle toward the ceiling.

14. All manipulations with the rifle, alterations, aiming for the purpose of regulating the sights, must be done on the stand, the muzzle pointing toward the targets.

15. The rifles must be placed one after the other in the rifle stand, and must be taken off in the same order for firing; the shooter must leave the stand without delay as soon as his shot is marked; nobody is allowed to interfere with a shooter when aiming.

16. Any shooter offending against these rules (13, 14 and 15) will be fined one dollar (\$1), and if he repeats the offense he will be excluded from the shooting-house for the rest of the day.

17. A shooter, who doubts that his shot was correctly marked, has the right, on depositing one dollar (\$1) to demand a committee of three (3) shooters to be appointed by the Shooting Master, and one of whom must be a member of the Shooting Committee, to inspect the target. If the committee finds the marking correct, the shooter forfeits his dollar for the benefit of the fund for fines.

18. Every shot counts which goes off on the stand after the rifle has been brought to the shoulder.

19. If the rifle misses fire, the shooter can make himself ready a second time; on missing again he must remove the cap or extract the cartridge and leave the stand, the ticket being returned to him; on coming back he must place his rifle last in the row.

20. All differences concerning the shooting are settled by the Shooting Committee; nobody is allowed to enter the target stand while the shooting is going on, without the permission of the shooting-master, and then only in company of two members of the Shooting Committee.

21. Burning out of the barrel and exploding of caps must be done on the shooting stand; nobody is allowed to fire a shot except during shooting time.

22. It is prohibited under all circumstances to offer or furnish the markers, Warner or secretaries, refreshments while in service, or to enter into a conversation with them.

23. Any attempt to bribe any marker, Warner or other servant, or to forge a shooting ticket, will be punished both by expulsion from the Union, thereby losing all claims on prizes, premiums or entries, and dishonorable expulsion from the Shooting Park.

24. Nobody is allowed to have more than one pound (1 lb.) of powder on the loading table, which must be kept in some closed receptacle; larger quantities must be deposited in the magazine.

25. Nobody is allowed to use more than one rifle on targets of the same class.

26. Smoking in the shooting-house and shooting outside the range is forbidden under penalty of one dollar (\$1).

27. The Shooting Master shall appoint six (6) shooters belonging to other rifle clubs, as additional members of the Shooting Committee.

28. The measurement of the best bull's-eye shot is to be done by a proper gauge.

29. Nobody is allowed to shoot on the main targets without a member of the Shooting Committee being present.

30. At the distribution of prizes, parties claiming a prize must produce the shooting ticket, and surrender the coupon of it as a receipt.

31. In all cases the decision of the Shooting Committee is final.

THE FIRST WIMBLEDON CONTEST.—In overhauling some old files of English papers, I have stumbled upon the accounts of the first rifle contest at Wimbledon. They are quite interesting in themselves, and furnish opportunity for comparison with later progress and new methods. The date was Monday, July 2, 1860, and the occasion was made memorable by the presence of Queen Victoria, who fired the first shot from a Whitworth rifle, which had been trained on at a distance of 400 yards, scoring a bull's-eye. The Queen also made a little speech, and the Prince Consort made another, in which he touched the key-note of the whole matter of rifle practice, using these words: "I appreciate the value and importance of encouraging the volunteers in their endeavors to acquire that skill in the use of their weapon on which their whole efficiency depends." The English government and people have never faltered in supporting this sentiment, and the result is a volunteer force in constant readiness to meet any emergency. With the exception of New York, no State in the Union has yet realized what was so clear to the English nearly twenty years ago. The contests continued for a whole week, and one match was carried over into the succeeding week. There were twenty targets, and the contestants included twenty Swiss. The targets at short-range were six feet by three, with an eight-inch bull's-eye; those at long range, six feet square, with a bull's-eye two feet square. The bull's-eye counted three, centre two, and outer one. Positions are not stated, except that at long-range the shooting was with a rest. There was no restriction as to trigger pull, but the military used the long Entle rifle, being about four pounds pull. In the all-comers' match, the only breech-loaders mentioned were those of Westley Richards. Some, if not all the Swiss, had shaded front sights and used a hair trigger. The shooting seems to have been most inferior to that of late years, but it must be borne in mind that the targets were smaller, and the method of scoring very much against high scores.

At 200 yards, 5 rounds, possible 15, seven prizes, the first prize was taken by a Swiss with a score of 12; the fourth, fifth, sixth and seventh were also taken by Swiss.

At 300 yards, 5 rounds, possible 15, seven prizes, the first was taken by a volunteer with a score of 9; the third and fifth were taken by Swiss.

At 500 yards, 5 rounds, possible 15, seven prizes, the first was won by a volunteer with a score of 7. In another match at same distance, for Swiss only, the winning score was 9. In a third match the winning score was 7.

At 600 yards, 5 rounds, possible 15, the winning score was 6.

At 1,000 yards, with a rest, 5 rounds, possible 15, the first prize, £50, given by the Duke of Wellington, was taken on a score of 3 by Lieut. Archibald; and the second prize was taken by a Swiss on the same score.

At 800 and 1,000 yards, 5 rounds each, possible 30, the first prize was taken by a Swiss with a score of 10.

At 800, 900 and 1,000 yards, 10 rounds each, possible 90, the first prize, £100, presented by the Prince Consort, was taken by Lieut. Lacy on a score of 22; the third prize was won by a Swiss on a score of 18. At same distances the Queen's prize of £250 was won by a volunteer with a score of 24.

The postponed match was for a prize of £30, offered by Miss Burdett Coutts, and was at 400 yards, rounds 10, possible 30. Four men tied at 13, and it was finally won by a Swiss who scored four in the next two shots, making his total 17 out of a possible 30.

None of the rifles now used by British marksmen are mentioned, and it must be conceded that not only the marksmen, but the riflemakers have made great strides in advance. In this country, notwithstanding rifle practice is of recent date, the pupil has outstripped its teacher in many respects. It only remains to extend the system to the militia of all our States. While the main support of such a system must perhaps come from the States themselves, it would seem, that the general government ought to be aroused to the importance of this matter, and extend its aid to some extent. R.

THE MARTINI RIFLE.

EDITOR FOREST AND STREAM:

I have taken special interest in all the able letters about rifles, called forth from various parties by the results of the international match. The articles of foreign writers have been copied and commented on till there is little more to say. I read with great pleasure one from the pen of such a practical man as is Mr. Ferris of Utica. I have read, too, with interest, the article signed "W. D. P.," of St. Louis. In a late number, which states fully what I have held all along—that with a proper cartridge and a change of sights, our American breech-loading match rifles were adapted to all the requirements of the frontier. Several persons in this city have had their long-range Martini rifles fitted with the Remington combination—rear sight put on the barrel just forward of the receiver, where it is out of the way, and a Beach combination front sight, fitted to go in in place of the wind-gauge front sight, and so have a gun for long-range or off-hand shooting without carrying or expense of owning two rifles. The combination rear sight can be used with the pin-head disc in wind-gauge sight for off-hand practice, and affords absolute safety from the rear sight striking the face in firing 100 to 105 grains powder off-hand. I must say, in passing to "W. D. P.," that if he had had the pleasure of owning and using an American-made Martini, he would admit that the rifle could be as readily and thoroughly inspected as any of those he names. The whole secret is in keeping the block polished and resting the butt on the ground; another, looking through from muzzle with breech open. In this manner all imperfections near the breech are magnified, and in mine, which I have used now three years, and have fired, as my bills for bullets show, over 6,000 times, I can see the least particle of dust or dirt, and locate it at once. Now, I wish to ask a few questions about the Express principle, and would say that I have faith in what our British cousins call the Henry rifle, and believe it does give better results with heavy charges than our common grooving; yet my experiments at the target lead me to think that the Express rifle, with its large charge and light bullet, is not so accurate a weapon as our rifles with the heavier ball, or rather with our proportionate weights of powder and lead. I have a .40-cal., 30-inch barrel, Martini rifle, made by P. T. C., chambered for a shell holding 70 to 74 grains powder. I have bullets that weigh 300 grains and 335 grains, respectively. With 72 grs. powder and the 335-grain bullet, I have repeatedly put ten consecutive shots, at a distance of 125 yards, inside a 3-inch circle. With the same charge of powder and the 300-grain bullet, I have seldom put ten consecutive shots so close that less than an 8-inch circle would inclose them, while with 62 to 64 grains of powder the 300-grain bullet would make nearly, if not quite, as good a pattern as the heavy one. In regard to the trajectory of the lighter bullets, they will average only about four inches higher at 125 yards than the 335-grain bullet, the powder being the same in each case.

Now, will some of our sportsmen who have tried like experiments give us their experience in FOREST AND STREAM. All our long-range marksmen know that the charge of powder cannot be increased beyond a certain limit, except at the expense of accuracy. AMATEUR.

A NEW SCORE CARD.—Dennison & Co., of Boston, publishers of rifle targets, etc., offer, through the N. R. A., a prize of \$50 for the best combined score card for long and short range, if practicable, or \$25 each for the best one adapted to long or short range, the blanks to be submitted to a committee of the N. R. A., and the award to be decided by such committee. Competition open until April 4; all forms to be sent to this office. Competitors will inclose their forms with a *nom de plume*, accompanied by a sealed envelope with this *nom de plume* on the outside and the real name within.

HANDSOME PRIZES OFFERED BY THE SHARPS RIFLE COMPANY.—The following correspondence explains the two money prizes offered by the Sharps Rifle Company, and the conditions necessary to win them:

BRIDGEPORT, Conn., March 14, 1878.
To GEO. S. SOHRMERNHORN, Esq., Secretary National Rifle
Association, New York:

The Sharps Rifle Company offer gold prizes, open to the world. To the marksman first making 220 or more out of 225, with a Sharps rifle, during the year 1878, \$150; to the marksman making the highest score, with a Sharps rifle, during the year 1878, \$100.

CONDITIONS.—Fifteen shots at each 800, 900 and 1,000 yards. No one person can take both prizes. Coaching allowed, but competitors must otherwise observe rules same as governed competitions for positions on International Team for 1877 at Creedmoor. Score must be made in a public match by a member of any rifle club or association organized prior to March 1, 1878, and in which not less than six competitors shall complete their scores, whose testimony as to the making of the winning score will be required, with such additional evidence as circumstances may seem to warrant.

Yours truly, SHARPS RIFLE COMPANY,
E. G. Westcott, Treas.

NEW HAVEN.—Wallace Gunn, of Bridgeport, won in the all-comer's match at the New Haven rifle range, on March 9, making 33 out of a possible 35 at 500 yards, using the fine Sharps' rifle recently presented to Captain S. C. Kingman.

TARGET WITH A STEVENS' PISTOL.—Mr. E. D. Castelow, of West Meriden, Conn., sends us a very remarkable target made by him with a Stevens' pistol, barrel 6 inch, .22 cal. The pistol was shot at a rest, distance 210 yards. One is a hull's-eye, and the rest are not far from it. Of course shots at a rest do not show quite as much the skill of the shooter as the excellence of the arm. With only a six-inch barrel the Stevens' pistol must be a wonderfully accurate arm.

THE MATCH AT CREEDMOOR, JR.—This match, which was concluded on Saturday, as follows:

Dr Dudley, first prize.....	47	47	47	46	47	46	49	46	46	47	—40
C Blydenburgh, second prize.....	48	45	45	45	45	48	47	45	47	45	—46
H H Holton, third prize.....	46	45	46	45	48	45	48	46	45	47	—40
F W Todd.....	46	40	45	46	48	45	48	46	45	47	—43
D F Davis.....	46	44	44	44	44	44	44	43	43	43	—39
H F Clark.....	47	41	46	40	46	42	40	42	47	44	—12

There were sixteen entries in the match, but the above were all who concluded their scores within the specified time.

SEPTENFELDT RIFLE TEAM.—104 Bowery, March 15.—175 feet, off hand; bull's eye, 2½ inches; Creedmoor target; possible 50. Score:

N W Hook.....	46	Jas Dwyer.....	43
J Garrison.....	46	Sp Laing.....	43
A Gruenberg.....	41	O Becker.....	42
E Story.....	41	Wm Gutenberg.....	41

A Altman	7	8	5	1	6	8	9	7	7	8-6

GREENVILLE SPORTSMAN'S ASSOCIATION.—A new target has been adopted. It consists of a four-inch bull's-eye, thirteen-inch centre, twenty-six inch inner, and outer twenty-four by thirty-six inches—just one-half the size of the Creedmoor one hundred yards target. A trial shoot at 100 yards resulted in the following score :

D McGanghney	5	4	5	4	3	3	4	4	8	4	3
A W Walters	4	4	4	4	4	4	4	4	2	3	4
E A Leavy	4	4	3	4	4	4	4	4	4	8	3
Sam Bell	4	4	3	3	4	4	4	2	4	4	3
Fred Sackett	3	4	5	3	3	4	4	4	4	4	3
L H Ale	2	3	6	4	4	4	8	5	3	3	2
Al Kins	4	3	4	4	4	4	4	3	3	3	2
F G Chorprenbig	3	3	3	4	4	2	4	3	3	3	2
F I Snyder	4	3	3	3	3	4	4	3	3	4	3
E M Blochfeld	2	4	2	4	4	5	2	2	4	9	2
J L Kragle	4	3	4	3	4	4	0	4	3	3	3
Jas McLaughlin	3	3	3	3	4	4	3	2	3	3	3
H Bridge	3	3	3	4	4	4	3	0	0	3	3
George Moore	4	3	3	0	w						

EASTON RIFLE ASSOCIATION.--The riflemen of Easton, Pa., have obtained permission to use the fair grounds at that place on Monday of each week, each member of the Rifle Association paying therefor a yearly subscription of \$2.50.

PENNSYLVANIA—*Philadelphia, March 16.*—Captain John J. Wright's rifle team: first target match, 400 yards range:

Capt John J. Wright.....	5	4	5	5	5	3	5	5-15
Harry C. Clark.....	5	5	3	4	3	4	5	5-4
William J. Burns.....	4	5	5	1	6	3	4	4-2
George A. Clarkson.....	5	5	5	3	4	5	4	8-5
Charles H. Don.....	5	5	4	3	5	3	3	3-6
James J. Parker.....	3	4	4	3	5	3	5	3-37

Captain Wright deserves the credit of having organized this team, and the hope may now be entertained that Philadelphia, somewhat backward as to rifle matters, will soon come to the front. There are many strong amateurs in Philadelphia, as to the science of rifle shooting. Some of the best articles in the FOREST and STREAM AND ROD AND GUN have been due to the pen of a Philadelphia gentleman.

TEXAS—Waco.--Lane's gallery, March 2:

W T Lane.....	5	4	6	4	5	6	5	5	6	6	4	5	5	5	5	6	5	5	5	6	9

RIFLE SIGHT.—A new Vernier long-range sight has recently been invented by Capt. S. C. Kingman, of Bridgeport, Conn. By its use the cup or peep can be instantly moved the whole length of the slide and still have the benefit of the Vernier scale.

—Dr. Carver, of California, has promised to be in Logansport, Indiana, next May and exhibit his glass-ball shooting with rifle.

The Kennel.

FOR CORRESPONDENTS.—Those desiring us to prescribe for their dogs will please take note of and describe the following points in each animal:

1. Age. 2. Food and medicine given. 3. Appearance of the eye; of the coat; and of the tongue and lips. 4. Any changes in the appearance of the body, as bloating, drawing in of the flanks, etc. 5. Breathing, the number of respirations per minute, and whether labored or not. 6. Condition of the bowels and secretions of the kidneys, color, etc. 7. Appetite; regular, variable, etc. 8. Temperature of the body as indicated by the bulb of the thermometer when placed on the body and the foreleg. 9. Give position of kennel and surroundings, outlook, contiguity to other buildings, and the uses of the latter. Also give any peculiarities of temperament, movements, etc., that may be noticed, and of suffering, etc.

FIXTURES FOR 1878—BENCH SHOWS.

Boston Kennel Club Show, Boston, Mass., March 26, 27, 28 and 29. Dr. E. J. Forster, Secretary.

Baltimore Kennel Club's Show, Baltimore, Md., April 23, 24, 25 and 26. L. R. Cassard, Secretary.

The Westminster Kennel Club (New York) Bench Show, Gilmore's Garden, May 16, 17, 18 and 19. Dr. W. Seward Webb Secretary.

FIELD TRIALS AT THE EAST.

468 BELLEFONTE, Nottoway Co., Va., MARCH 15, 1878.

I WROTE you a letter last year on the propriety of holding field trials somewhere in the East. Hitherto the State of Tennessee is the only one in the Union that has any claim to having inaugurated dog field trials in America. A field trial is the only real way of testing a dog's merits, as it is held in the field, and the birds shot, on just the same plan as in the

ordinary field sports over a dog, with this proviso, that the dogs and handlers of dogs must conform to certain laws, which are mutually agreed on beforehand by the owners of entries. There are so many good dogs now everywhere, especially in New York, Boston, Philadelphia, and Baltimore, that a section of country I am sure could be found within easy access a comparatively moderate fares, to and from the before-mentioned cities. This is all important, and a great desideratum with owners of dogs who wish to enter their animals in a field trial. To talk plainly, how long would it take to carry out these trials, and what would be the total cost to owners and spectators? These questions should be answered distinctly, as the great complaints hitherto made have been, "The distance is too far, and the pleasure does not justify the expense." In my opinion the section of country to hold these trials is in some part of either the States of Maryland, Delaware or Virginia.

As this is only an initiatory letter at present, I would kindly call on the Baltimore Kennel Club to make positive inquiries from their numerous friends as to birds on the eastern shore of Maryland.

I am informed by the Secretary of the Old Dominion Steamship Co., W. H. Stanford Eyre, that there is excellent shooting all along the line, which runs from Lewes, Del., to Snow Hill, on the border of the Virginia State line. The Old Dominion Steamship Co. is prepared to give every facility and accommodation to sportsmen or anglers with their dogs or boats. Should the Baltimore Kennel Club conclude to hold a series of field trials either in the States of Virginia, Maryland or Delaware, the Old Dominion Steamship Co. propose to take sportsmen, trainers, their dogs and appliances at an extremely moderate rate. From New York to Lewes, Del., takes only about twelve hours. The country bordering on the line of the roads from Lewes, and in fact generally down through the Peninsula, affords fine sport with both rod and gun. As it has only been recently opened up, it is known to but a comparatively few people. The angler will find sheephead, bluefish and weakfish at the mouth of the Chesapeake Bay off Lewes, and generally down the beach to the Capes of Virginia. The marshes around Lewes contain many English snipe, and in the covers down toward the cape many red foxes are found. There is a good hotel at Lewes conducted by M. Frederick. In and around Rehoboth Bay, five miles from Lewes, snipe and wild fowl are abundant. Georgetown and the surrounding country afford fine quail shooting, as the country is a series of open plains, bordered by thickets, and some swamps, which latter protect the birds to some extent and prevent their too rapid destruction. The people are kind and generous in extending the privilege of their lands to true sportsmen. The brick hotel at Georgetown is well kept and moderate in its charges. The proprietor himself is a sportsman, and understands the ways and needs of the fraternity. Working down the road from Georgetown, Millshoro, Dagsboro, Frankford, Selbyville and their surroundings are about the same character of country. Frankford is near the head of Indian River, on which fine wild fowl shooting can be obtained.

Berlin is a capital base or headquarters for sportsmen, as
 besides the excellent shooting immediately surrounding it all
 parts of this section of the State can easily be reached from
 there. The Wicomico road opens communication with the
 Chesapeake side of the Peninsula. At Snowhill and vicinity
 there is fine woodcock and quail shooting in the season, and
 the marsh and flats from Snowhill down toward Stockton and
 Franklin is the home of immense numbers of English snipe
 during their migrations. At Chicoteague and the sounds
 and bays along the beach all varieties of snipe, duck, brant
 and geese are found in great numbers. At all of these principal
 points good hotels are located, and as conveyances can be
 had cheaply, very large tracts of country can be shot over
 each day.

to Having said so much of the Eastern Shore of Maryland, I beg to offer another suggestion: I would like to comment on what has been hitherto the great drawback to the successful issue of field trials, and that has been the scarcity of birds; not that there has not been a goodly number of quail but in a totally insufficient quantity. Where is the section of country within easy distance of the large northern cities where quail can be found to test successfully 30 to 40 dogs. If the birds fail everything fails, and in placing a new recreation before the field sportsmen of America, it behooves the managers of field trials to be sure that there are plenty of birds.

In this part of Virginia and also along the James River and Kanawha Canal the planters and farmers have seeded probably more wheat than at any time since the war, and together with the unprecedentedly mild and open winters there is every prospect of a very successful crop.

probability of birds being very plentiful, but as a writer very justly remarks, "Where birds are plentiful accommodation is scarce." In order to have both birds and accommodation, the only feasible plan would be for the committee to hire three passenger canal boats on the James River and Kanawha Canal, and to fit them up suitably; one boat could serve as a sleeping boat, another as a boat where repasts could be obtained, and the third as the dog boat. Under careful management this could be carried out with success, as the boats would be under the command of a superintendent, and they could be stopped anywhere and at any time, thus having always fresh ground for fresh dogs. It is indispensable to have a good caterer with polite assistants, and the "colored pusson is the gemman." It might appear to the managers of the field trials that this arrangement would be very expensive and uncomfortable; but on the contrary, no other plan could be more economical or attended with less annoyance. These boats would accommodate 100 sportsmen, attendants and their dogs, move along at lunch time, changing position from time to time, travel at night, etc., as might be found expedient. I merely throw out these ways and means as practicable, as several sporting friends of mine have traveled in this *al fresco* way and killed large amounts of game. Sportsmen and their dogs could come by the Old Dominion Line of steamers from New York to Richmond and return, including meals and state-room, for the moderate fare of \$20. Their dogs would be properly cared for and carried without expense of any kind. Perhaps it may be thought too early in the day to mention the names of gentlemen who would interest themselves in this matter, but as it is never too early to start a good thing, I would therefore suggest that the Baltimore Kennel Club ascertain the positive quantity of birds to be found in these different localities, and not to be satisfied with the usual answer, "There are plenty of birds," but to look and see for themselves whether the facts are as stated. The gentlemen who are more cognizant with these routes and in their own sections are Mr. Von Culin, of Delaware City, who lives adjacent to the line of route by Georgetown, Selbyville and Berlin, and Mr. Ohas. Palmer, the President of the Virginia Game Protection Association of Richmond; and from what I know of the members of the Baltimore Kennel Club

Club they are both willing and able to take care of their own State. These trials we must have in one of these three States, as there are numbers of gentlemen who would only be too glad to have the opportunity to enter their dogs, providing the time taken up was not excessive, nor the outlay too great. In another letter I will treat on the rules and regulations on which dogs are now judged by at field trials. On my return from Europe, where I expect to see the working of dogs at the Horsehead field trials, I trust to be able to compare their trials with our own. I shall be pleased to give such observations to the public; at present I am totally opposed to the laws and rules on "points" governing trials now in vogue.

I would like to say one word again to the Baltimore Poultry Association. Would it not be a good plan for the owners of homing pigeons to carry along a few of their crack birds in connection with the dog field trials, as where there is no telegram—and I believe there is none on the James and Kanawha Canal. Even should there be telegraphic communication, it would be grand sport to throw up a couple or so of "homers" and carry the news of the winners of the field trials to Baltimore, and they could have a race on their own account. Judging pigeons—especially carriers—in a coup, is all very proper; but the combination of beauty, feathers, good breeding and characteristic marks, with the instinct carried out of flying long distances in the shortest possible time, is what is required; or, in other words, it is pace and style that win. I am aware the birds would require considerable training. The way I would start about it would be this: Put one of my best "homers" in a bag; give the bag to the conductor or reliable baggage master—one that takes an interest in these matters—and plenty of them can be found; let such a conductor start on his regular train, which runs daily from Baltimore to Richmond, and instruct him to fly the bird five miles out, according to his homing qualities, noting especially time and distance. This could be carried out in the same manner, from time to time, until the bird was thrown up from Richmond. As these birds are expensive, I am aware there is some difficulty to be overcome. It is possible the birds might be shot. However, the papers would gladly make an item about them, and request people not to molest the birds.

I could write more fully on this matter, but at present I only want to throw out a hint to those most interested.

JNO. M. TAYLOR.

For Forest and Stream and Rod and Gun. COLORS OF SETTERS.

ALTHOUGH afraid that the readers of your paper are almost tired of hearing any more arguments on the different colors of setters, yet I trust I can explain a few points more fully, as my friendly adversary, Mr. E. Smith, has had the same privilege, though this shall be the last on my part.

We agree on all important points, excepting the practicability and preference of the red color for field work. Mr. E. Smith admits that he appreciates the solid white color in cover shooting, but as the covers in Maine are so thick that even a white dog could not be seen far away, "he would nevertheless put a hell on the dog." Yet, a dog more or less white can surely be seen at a far greater distance, and much more readily at any distance, than a red dog, no matter how dense the cover might be. Now, as a rule, the covers in New Jersey, New York, Pennsylvania and Connecticut are not so thick but that a white dog may be kept in sight in ordinary hunting. While hunting the alder covers of Litchfield county, Conn., four years ago, in company with "Old Smeedy," who knew every cow path for twenty miles around, we one day hunted with a party of gentlemen, using only red setters. The advantages of our more or less white dogs over the red ones were very striking. The owners of the excellent red dogs freely admitted this. There would be a constant whistling and calling, in spite of bells, when the red dogs were on a point or almost within reach. We, however, had none or hardly any trouble in keeping our dogs in sight. This holds good, in the same proportion, for all cover and upland shooting.

Mr. E. Smith does not approve of letting a dog range off further than two hundred yards each side of him. This I admit is fully far enough under ordinary conditions. I shall, however, explain why I prefer a dog which is not afraid to range half a mile under certain circumstances. Most of my shooting is done before 8 or 9 A. M., as I then have to go to the city. Our marshes are extensive. As a rule, birds are found only in certain spots, which are often far apart. This being the case, everybody must admit that a dog which will go from one place to another, without waiting for his master to follow, and upon finding birds point them till they can be flushed and shot at, is of great advantage, and this holds good almost wherever snipe are found in the East. I would like to mention one instance: One day last October a brother of mine hunted my white and red setter Dash. He had killed four or five birds on the Penhorn meadows, and upon arriving at the road near the bridge the old dog went down the road on his usual trip to an excellent piece of snipe ground, while my brother waited. In about ten minutes the dog stopped, and to all appearances pointed. We have measured the distance, and it is fully half a mile from where my brother watched to the pointing dog. A red dog could not be seen on these grounds at such a distance, and my brother would have been deprived of the rare pleasure of killing four snipe over a single point. The good old "sniper" never stirred while the first, then a double, and the fourth and last bird were killed over his staunch point. We have, however, many excellent snipe grounds, where it is difficult to keep a dog in sight, especially a red one, at two hundred, or even one hundred, yards distance.

I cannot agree with Mr. Smith that the sportsman will have many more shots when hunting a red dog than one that has a more contrasting color to all surroundings. In fact, in my experience I have never noticed it, although I admit it might, in some cases, make a little difference in favor of the red color. However, success depends almost entirely on the skill of the hunter and the good field qualities of his dog. We do not meet with many plovers, curlews or other large shore birds on our meadows, but on one occasion we killed eight out of nine large yellow legs, calling the flock back four or five times in full view of two white dogs, retrieving, till only one was left

to tell the sad story. Bitterns, rails, sand pipers or herons we rarely molest when snipe hunting, for our dogs' sake, excepting we meet with new specimens. In such duck shooting as we meet with while snipe hunting the color is also of little importance. I have, on one or two occasions, seen my dogs stiffly pointing on a duck, and also oftener had them standing in full view of ducks, without losing my shots on account of it.

Mr. Smith, I have probably expressed only personal and local views, as one color might be preferable for our locality and purpose and not for another. However, I argue that it is of far greater importance to have a dog kept easily in sight than not, and run the chance of having a few more shots at bitterns, sand-pipers, etc., which chances are undoubtedly outbalanced by those which are lost by not having the dogs in sight. It is very certain that much game is found, pointed, flushed, by dogs, and lost, of which the sportsman is not aware.

JUSTUS VON LENGERKE.

New York, March 11.

MASSACHUSETTS KENNEL CLUB.

We give the number of entries for the special prizes with a list of the additional specials. Everything points to the certainty that the Boston Show will be a superb one. Total number of entries, 830, with over 700 dogs:

SPECIAL PRIZE LIST—ENTRIES.

- Class A—For the best kennel of English Setters, either native or imported, to consist of not less than five, and to be owned by exhibitor—3 entries.
- Class B—For the best kennel of Irish setters, either native or imported, to consist of not less than five, and to be owned by exhibitor—3 entries.
- Class C—For the best kennel of Gordon setters, either native or imported, to consist of not less than five, and to be owned by exhibitor—7 entries.
- Class D—For the best kennel of pointers, either native or imported, to consist of not less than five, and to be owned by exhibitor—5 entries.
- Class E—For the best kennel of water spaniels, to consist of not less than four, and to be owned by exhibitor—1 entry.
- Class F—For the best English setter stud dog, either native or imported, to be shown with two of his get—5 entries.
- Class G—For the best Irish setter stud dog, either native or imported, to be shown with two of his get—2 entries.
- Class H—For the best Gordon setter stud dog, either native or imported, to be shown with two of his get—2 entries.
- Class I—For the best pointer stud dog, either native or imported, to be shown with two of his get—1 entry.
- Class J—For the best English setter brood bitch, either native or imported, to be shown with two of her progeny—3 entries.
- Class K—For the best Irish setter brood bitch, either native or imported, to be shown with two of her progeny—3 entries.
- Class L—For the best Gordon setter brood bitch, either native or imported, to be shown with two of her progeny—5 entries.
- Class M—For the best pointer brood bitch, either native or imported, to be shown with two of her progeny—8 entries.
- Class N—For the best display of foxhounds, to comprise not less than two couples, to be owned by exhibitor—2 entries.
- Class O—For the best mastiff, dog or bitch—9 entries.
- Class P—For the best St. Bernard, dog or bitch—6 entries.
- Class Q—For the best pug, dog or bitch—4 entries.
- Class R—For the best pair, dog and bitch, of Irish setters, imported or native, to be owned by exhibitor—4 entries.
- Class S—For the English setter, dog or bitch, either native or imported, that has the best and handsomest head—22 entries.

ADDITIONAL SPECIAL PRIZES.

- Class T—For the best setter of any breed, dog or bitch, imported or native, in the show; a silver cup, presented and manufactured by Messrs. Shreve, Crump & Low, Boston, Mass., value, \$225—9 entries.
- Class U—For the best field field spaniel, dog or bitch, either elmer or cocker; Baird's History of North American Birds, by S. F. Baird, T. M. Brewer and R. Ridgway. Illustrated by sixty-four beautifully colored plates and five hundred and ninety-three wood-cuts, 3 volumes, presented by Messrs. Little, Brown & Co., Boston, Mass., value \$45—2 entries.
- Class V—For the best brace of beagles in the show; a handsomely mounted Stag's Head, presented by Arthur J. Colburn, Esq., Boston, Mass., value, \$25—1 entry.
- Class W—For the best pointer of any weight, dog or bitch, either native or imported, in the show; a fine breech-loading double gun, presented and manufactured by Messrs. Parker Bros., Meriden, Conn., value, \$300—21 entries.
- Class X—For the best native setter puppy of any breed, dog or bitch, in the show; a fine shooting suit, made and presented by Messrs. Lucas & Co., Boston, Mass., value \$80—3 entries.
- Class Y—For the best eye terrier, dog or bitch in the show; a silver cup presented by The Massachusetts Kennel Club, value, \$25—2 entries.
- Class Z—For the best Blenheim or King Charles spaniel, dog or bitch, in the show; a silver cup presented by The Massachusetts Kennel Club, value, \$25—2 entries.

KATHLEEN IN BOSTON.—We cut the following from our English exchange, the *Sporting Gazette*, of March 2:

"That very handsome and highly bred all red Irish setter, Palmerston the Second, has passed into the kennels of Mr. John M. Niall, Killaloe, Ireland. Like his progenitors, both on sire and dam's side, he, too, though little more than a puppy, has already won many prizes in 'hot company.' He has been lately bred to owner's Sal, one of whose last litter (Kathleen) by Jenkins' Derg, has just been forwarded from Liverpool per steamship 'Bulgarian,' to compete for the puppy prize at Boston Kennel Club show, to be held on the 28th to the 29th March. Such pluck deserves to be rewarded by the youngest winning."

Would Mr. Niall let us have young Palmerston's pedigree? —ED. F. AND S.

DEATH OF ROBINSON'S JACK.—Mr. Walter Humphreys informs us of the death of this well known dog. Jack was a red Irish setter, and twelve years old when dead. Among his numerous get were the following dogs: Eugene Schorb's "Jocco" and "Flora;" Scott Rodman's "Flora;" Henry Sandford's "Don;" Dr. N. Salter's "Dash;" Hugh McLaughlin's "Dash;" Hamilton Thompson's old "Belic," and a host of others. The last named bitch was the dam of the celebrated prize winning dog "Duke," belonging to the late Hamilton Thompson. Jack was firm and true as steel in the field, and was famous for his docility and perfect training. His remains were buried in the middle of Mr. Humphreys' garden here, with all the honors due him.

WHY? OR! WHY?—[This is not our own; we are utterly incapable of such a thing.]—Why is a doctor like a well-trained setter? Because he is always ready to come to heel and charge. [This was perpetrated in Baltimore by E. S.]

Game Bag and Gun.

GAME IN SEASON IN MARCH.

Hares, brown and gray. Wild duck, geese, brant, etc.
FOR FLORIDA.
Deer, Wild Turkey, Woodcock, Quail, Salpa, Ducks and Wild Fowl.

"Bay birds" generally, including various species of plover, sand piper, snipe, curlew, oyster-catcher, surf birds, phalaropes, avocets, etc., coming under the group *Limicola*, or Shore Birds.

VERMONT—Rutland, March 14.—Parties out fox hunting recently killed nine foxes in one day in West Hartford.

NEW YORK.—Greenwood Lake, March 11th.—The return of the migratory birds is uncommonly early this season, as you will see by the following items and dates from my note-book: Feb. 27th, blue birds (*Sialia sialis*); March 1st, black-birds (*Agelaius phoeniceus*); large flock of crows seen flying high and heading north; March 3d, woodcock seen near "Ravine" by A—R—; March 5th, robins (*Turdus migratorius*); March 6th, this evening heard "Peper" frogs for the first time (the old fishermen say that after the "pepers" have "peped" three nights, the catfish will bite, so dig your worms); March 8th, more woodcock seen on west side of lake, near "Bahcock's Cove"; March 9th, heard meadow larks (*Sturnella magna*) whistling their summer note, and very acutely felt a wasp, whose "business end" was in "A No. 1" condition; squelched him instantly.

GREENWOOD.

Kingston, March 13.—Zeke Catalin, a hunter of Denning, shot a large bear near the Peak of Moose Mountain in that town on Monday, 11th.

OWN HARRY.

Saratoga, March 15.—Sportsmen report that black ducks have already made their appearance in the marshes around Saratoga Lake and Long Lake in Ballston.

A BOY'S EXPERIENCE AT MORICHES.—"Jack Curlew," of Brooklyn, sends us a charmingly naive account of his first experience in duck-shooting at Moriches. After a series of misadventures, which we assure our young friend are absolutely indispensable in the apprenticeship of a mighty shooter of ducks, the party arrived at their destination. The first day, having killed one duck, he tells us, with rare ingenuousness:

"I had no way of getting him, as my boat was a long distance off and the wind blowing off shore; he would drift out of sight before I could reach him. At that moment I noticed a sail-boat coming in my direction; I waited until it was within hail, and asked the man if he would get it for me, which he did, but forgot to bring it ashore. As I had no way of reaching him, I blessed him in an euphuistic manner and continued my tramp."

One duck was bagged, however, before his return, and, rowing over to the house, he found his comrade, H., who had had worse luck than he, not having seen a duck. The next day's hunt was equally unsatisfactory:

"Our total bag consisted of one quail and a pigeon, which I succeeded in bagging among some corn. Next day we concluded to leave, so that is our experience at Moriches, of which I have had enough."

DUCKS AT GOOD GROUND.—A city correspondent writes: I have just returned from a short trip to Wm. Lane's Good Ground, L. I. Had two days' shooting; killed forty broad bills, fifteen red-heads, and three brant. Old gunners say there never have been as many ducks in the bay at any one time as now. The new inlet is working nicely. F. M. T.

ADIRONDACK VIEWS.—The Sloc Bros., of Poughkeepsie, who enjoy a wide reputation for the excellence of their work, publish admirable photographs of two oil paintings by Pierce, of Syracuse. One, which we think the better of the two, is a view of Hathorn's "Forest Cottage Camp;" the other is a view on Smith's Lake. Both pictures will be of interest to those familiar with the scenes.

—Wild geese and brant were never more plentiful than recently in Manahawken Bay. The writer visited the bay on Saturday last, and learned from a well-known Barnegat Bay man that night shooting and firelighting has been indulged in almost every night since the new moon. Guns can be heard at all hours of the night, and the consequence is that not a fowl is to be seen in that part of the bay. The law-breakers are supposed to belong on a vessel from Tuckerton and another boat from the head of Barnegat Bay, but no names are mentioned yet.

PENNSYLVANIA—Drums, March 13.—Prospects for Bob Whites are good for next fall. We are cursed with Sunday hunting and fishing; more game killed on Sunday than all the week-days put together, and too much game killed out of season.

Penn.

SHARON SPORTSMAN'S ASSOCIATION.—The officers for the ensuing year are: Pres., Thomas E. Blunt; Sec., C. E. Tribby; Treas., E. R. Obl. The Association has now fifty members in good standing.

MINNESOTA—St. Paul, March 10.—Ducks and English snipe remained here until Christmas, and the former at least, with geese, are long ago back by the hundred. In many places the farmers are already hard at work putting in their spring crop—fully four to six weeks earlier than usual. The ice on Lake Pepin is gone, and last Thursday, the 7th inst., the first steamer passed the lake, 20 days earlier than any previous year in the memory of the oldest inhabitant.

We have for the last 24 hours had a rainstorm, which still continues; and may it last a long while, for water is much wanted in the country.

J. S.

A Shakopec correspondent says:

"The next crop of pheasants and prairie chickens will be an abundant one, owing, no doubt, to the unprecedented heat last summer preventing the killing of a large number of these favorite birds. The strangely mild winter so far has also helped

THE OLDEST PRESERVED MEAT IN THE WORLD.—Happening to drive in a sledge along the base of one of the monstrous ice cliffs that overhang the estuary of the River Lena, a Russian trader came upon a pack of wolves devouring the frozen flesh of a mammoth. The latter must have been in an almost perfect state of preservation when first exposed by the breaking away of the cliff, as the snow was littered by fragments of skin, to which in some instances small pieces of flesh still adhered. Considering that countless ages have rolled by since animals of the mammoth species could possibly have existed in Siberia, there seems small doubt of the frozen flesh in question (if it were really what it was alleged to be) being the oldest preserved meat in the world. If the story is as true in its details as the traveller would have us believe it to be, his supposition that other mammoths are imbedded there in an equally good state of preservation may turn out to be correct, and we may yet live to see the gourmands of Paris indulging their appetite with *filet de mammoth* warranted "fresh from Siberia," after having been stowed away in Nature's ice cellar for a few score thousand years. So little has been explored of the ice beds of Polar Siberia that, for aught we know to the contrary, a grain of truth may exist in the opinion of the same enthusiastic discoverer of that "accumulations of antediluvian animals frozen alive during the sudden transition of the climate of Siberia from equatorial heat to Arctic cold lie imbedded in the ice strata of the North Siberian coast." Until, however, some of the meat has been sent to Europe and has been pronounced genuine by Professor Owen, or some other eminent authority, we must be permitted to place the discovery of "meat mines" in the same category as that to which people usually assign the stories that have made Baron Munchausen's name immortal.—*London Globe.*

SEERMONS IN STONES.—The rude representations cut on rocks near the Lacs des Merveilles, Switzerland, have long been a puzzle to archaeologists. Some have believed that they were the work of the soldiers of Hannibal. (What busy people these soldiers must have been from first to last.) The most satisfactory explanation of the origin of these figures has just been given by M. Chiquet. He says that at certain seasons of the year shepherds could find near the rocks some herbage for their sheep and goats. To while away the weary hours the shepherds amused themselves in cutting figures which have cost days of owl's study to savans, who are more inclined to look for mysterious and remote authors of such things, than to accept an obvious and common-sense view.

Tiffany & Co., Silversmiths, Jewellers, and Importers, have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they prepare special designs for similar purposes. Their **TIMING WATCHES** are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. **TIFFANY & CO.** are also the agents in America for Messrs. **PATEK, PHILIPPE & CO.**, of Geneva, of whose celebrated watches they have a full line. Their stock of Diamonds and other Precious Stones, General Jewelry, Artistic Bronzes and Pottery, Electro-Plate and Sterling Silverware for Household use, fine Stationery and Bric-a-brac, is the largest in the world, and the public are invited to visit their establishment without feeling the slightest obligation to purchase.

UNION SQUARE, NEW YORK

Medicinal.

The Great European Novelty HUNYADI JANOS.

The Best Natural Aperient.

THE LANCET.—"Hunyadi Janos.—Baron Liebig affirms that its richness in aperient salts surpasses that of all other known waters."

THE BRITISH MEDICAL JOURNAL.—"Hunyadi Janos.—The most agreeable, safest, and most efficacious aperient water."

PROFESSOR VIRCHOW, Berlin. "Invariably good and prompt success; most valuable."
PROFESSOR BANBERGER, Vienna. "I have prescribed these Waters with remarkable success."
PROFESSOR SCANZONI, Warzburg. "I prescribe none but this."
PROFESSOR LAUDER BRUNTON, M.D., F.R.S., London. "More pleasant than its rivals, and surpasses them in efficacy."
PROFESSOR AITKEN, M.D., F.R.S., Royal Military Hospital, Netley. "Preferred to Pullna and Friedrichshall."

GENERAL GUIDE.

WITH MAPS AND ILLUSTRATIONS,

900 pp., Price, \$3.

BY CHARLES HALLOCK,

EDITOR OF "FOREST AND STREAM," AUTHOR OF THE
"FISHING TOURIST," "CAMP LIFE IN FLORIDA," ETC.

NEW YORK:

The book is a complete manual for sportsmen:
It gives every sportsmanlike method for capturing every known game animal, bird and fish in North America.

It designates the proper charges for guns for each kind of game, the various kinds of decoys and blinds, and baits and tackle for the fish.

It gives over 4,000 localities where game and fish may be found, specifies the game found in each locality, the hotel accommodation, and the best route to get there. (This preparation of this Directory was in itself a work of great magnitude.)

It gives the scientific name and specific characteristics of each species it describes, with the habits and breeding season of each—a most valuable contribution to science.

It describes 297 varieties of edible fish alone, that may be taken with the hook; 80 varieties of ducks; 50 varieties of snipe or waders, and the different methods of shooting each.

Its instructions for capturing large game are very minute, and the chapters on woodcraft, outdressing and camping have been pronounced by "El Cazador," of Los Angeles, California, to be simply complete.

Every kind of dog used for sport is designated, and his points for bench judgments fully given. The chapters relating to selection, breeding, rearing, breaking, care and diseases, comprise a seventh part of the volume. There are 71 prescriptions and recipes given under the revision of the best modern canine therapeutists.

It is in itself the most concise, accurate, instructive, sensible and comprehensive work ever written upon the dog and his diseases. Any physician can administer the prescriptions with perfect confidence in their safety and efficacy.

It contains very useful recipes and remedies for wounds, bites, poisons, illness, and emergencies of all kinds; for cleaning, repairing, and preserving every implement used for sport; for selection and use of every kind of boat employed by sportsmen; a reference list of several hundred books in request by sportsmen, and a directory where to buy outfitting goods.

It instructs in taxidermy, and tells how to preserve and mount specimens of animals, birds and fish.

Dog Paths to Success.

A PRACTICAL GUIDE FOR SPORTSMEN AND
TRAINERS.

FULL INSTRUCTIONS FOR BREAKING AND
TEACHING DOGS FOR THE FIELD.

To which are added the standards for judging
Pointers, Setters and Cocker Spaniels, with various
hints concerning the Cocker, with other miscellaneous matter.

HIGHEST HONORS
AT THE
Centennial World's Fair, 1876!
THE
SHONINGER ORGAN

PRONOUNCED UNANIMOUSLY AS THE
Best Instruments.

Their comparative excellence is recognized by the
Judges in their Report, from which the following
is an extract:

"The B. SHONINGER ORGAN CO.'S exhibit
as the best instruments at a price rendering them
possible to a large class of purchasers, having a combination of Reeds and Bells, producing novel and pleasing effects, containing many desirable improvements, will stand longer in dry or damp climate, less liable to get out of order, all the boards being made three-ply, put together so it is impossible for them to either shrink, swell or split." THE ONLY ORGANS AWARDED THIS HONOR.

There are 50,000 of our Instruments in this and the European countries in use, and they are so made that they will keep in tune, and stand any climate. They contain a magnificent Chime of Bells, tuned in perfect harmony with the Reeds, producing wonderful effects. The Music Rack, when tuned forward, will make a splendid writing desk, with our Book Closets and Swinging Lamp or Flower Brackets, with a stool boxed free with each Organ, makes the SHONINGER ORGANS the most substantial, convenient and perfect Organ.

ESTABLISHED 1850.

We are prepared to appoint a few new Agents.

A liberal discount to the Clergy, Sunday Schools, Teachers, Churches and Lodges.
Illustrated Catalogues, with prices, sent by mail upon application to

Gunpowder.

THE HAZARD POWDER CO.

MANUFACTURERS OF

GUNPOWDER.

Hazard's "Electric Powder."

Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. only.

Hazard's "American Sporting."

Nos. 1 (fine) to 6 (coarse). In 1 lb. canisters and 6 1/2 lb. kegs. A fine grain, quick and clean, for upland prairie shooting. Well adapted to shot-guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 6 (coarse). In 1 and 6 1/2 lb. canisters and 6 1/2 lb. kegs. Burns slowly and very clean, shooting remarkably close and with great penetration. For field, forest or water shooting, it ranks any other brand, and it is equally serviceable for muzzle or breech-loaders.

Hazard's "Kentucky Rifle."

FFG, FFG, and "Sea Shooting" FFG, in kegs of 25, 12 1/2, and 6 1/2 lbs. and cans of 5 lbs. FFG is also packed in 1 and 1/2 lb. canisters. Burns strong and sweet. The FFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FFG is the standard Rifle powder of the country.

Superior Mining and Blasting Powder.
GOVERNMENT CANNON & MUSKET POWDER; ALSO, SPECIAL GRADES FOR EXPORT, OF ANY REQUIRED GRAIN OR PROOF, MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's Agents in every prominent city, or wholesale at our office,
55 WALL STREET, NEW YORK.

Dittmar POWDER CO.

This Company has been reorganized and established with abundant capital and business experience, and will be prepared to meet all demands for this Powder. Agencies will be established as rapidly as possible, so that it can be procured of dealers in all parts of the country. It is

Now Used by Capt. Bogardus,
THE CHAMPION WIND SHOT,

in all his shooting indoors, and was used by him in the match at Gilmore's Garden, where he broke 5,000 balls in 500 minutes.

Extract from his new book, "Trap, Field and Cover Shooting":

"In this and all matches I have shot indoors, I have used the Dittmar Powder. It shoots strong and clean, and it can be made uniform it will be as good as any in the world. The load I shot with would have killed old cock grouse in December, or ducks or any feathered game or wild fowl."

It is also

Used Exclusively by Ira Paine
IN ALL HIS MATCHES.

By new process of waterproofing this powder is now made absolutely uniform. MR. CARL DITTMAR will give his whole time and skill to its manufacture.

All communications and orders should be addressed

Dittmar Powder Co.,
No. 1 Cortlandt St.,
NEW YORK.

Laflin & Rand Powder Co.
No. 26 MURRAY ST., N. Y.,

Sole Proprietors and Manufacturers of
Orange Lightning Powder.

No. 1 to 7, strongest and Cleanest made, in sealed 1 lb. canisters. Higher numbers specially are recommended for breech-loading guns.

Orange Ducking Powder,

For water-fowl, strong and clean. No. 1 to 5 in metal kegs, 6 1/2 lbs. each, and canisters of 1 and 6 lbs. each.

Orange Rifle Powder.

The best for rifles and all ordinary purposes. Sizes, FG, FFG and FFGG, the last being the finest. Packed in wood and metal kegs of 25 lbs., 12 1/2 lbs. and 6 1/2 lbs., and in canisters of 1 lb. and 1/2 lb.

All of the above give high velocities and less resistance than any other brands made, and are recommended and used by Capt. A. H. BOGARDUS, the "Champion Wind Shot of the World."

BLASTING POWDER AND ELECTRICAL BLASTING APPARATUS. MINERAL POWDER of all kinds on hand and made to order.

Safety Fuse, Frictional and Platinum Fuse.

HUNTING SUITS,

which attracted great attention and were much admired by all Sportsmen.

THE BOSTON SHOOTING SUIT.

Manufactured only by

G. W. SIMMONS & SON,
BOSTON, MASS.

NEW YORK AGENTS:

Fowler & Fulton,

300 BROADWAY,

The Best in Use.

ONLY ONE QUALITY MADE, AND THAT IS THE VERY BEST.

Flexible Waterproof, Tan-Color Duck.

Each article—coat, trousers, vest and hat cap—has the name and manufacturers' address stamped upon it, and no suit is genuine without it bears this imprint.

We make no discount except to the trade. The price of the suit complete is \$13.

The material is of the best quality of duck, waterproofed by a patent process. The color is that known as "dead grass shade."

The seams and pocket corners are copper-riveted, and nothing is neglected to make the whole suit complete in every way.

This is what one of our best sportsmen says of it, writing from camp: "Although I had been nearly eight hours under incessant rain, laboring and striving along under adverse circumstances, yet I found myself comparatively dry, and my clothes without a tear. For the benefit of our brother sportsmen, let me advise one of Messrs. Simmons' (of Boston, Mass.) Waterproof Suits. Oh! what a relief it was to find one's tobacco was dry, and that one could light a pipe; that you could laugh at your miserable friend, who stood shivering and shaking as if he had the palsy; and then, next morning, oh! what fun it was to see him mending his clothes, while I had not a tear to complain of! Ventilation, that great bugbear of waterproof suits, is legislated for in the most ingenious manner. No sportsman should fail to supply himself with a suit which is at once cheap, practical, and will last an almost indefinite time."

Our Flexible Tan-Colored Water-Proof Leather Coats, Breeches, Vest, Leggings and Caps are considered the finest things ever made.

Hart's Sportsman's Favorite Metallic Shells.

FOR BREECH-LOADING SHOT GUNS.

These Shells are easily loaded, and the caps easily extracted from inside. Head solid and much thicker than any Shell now made, giving a solid seat for cone or anvil, which prevents it from driving through or springing away, thereby causing miss-fires. The Cone is made of nickel, and fastened solid in its place. Neither rusts nor corrodes fast, like movable anvil made from steel. The Nickel Cone also prevents miss-fire when a cap has been left on shell for a few days, which is liable to occur either in steel or iron. These Shells are finely finished, and made any length ordered, from 2 1/2 to 3 1/2 inches. Shells and Loaders and Descriptive Price-Lists can be obtained from all the leading Sportsmen's Houses throughout the country.

FROM CAPTAIN BOGARDUS, CHAMPION WIND-SHOT OF AMERICA.
MESSRS. GEORGE E. HART & Co.—Gentlemen: The fifty Shells I received from you to-day suit me better than any I have ever used. They are stronger and better in every respect, and I shall use them in all my shooting hereafter.
Yours truly, A. H. BOGARDUS.

W. W. Greener's Champion Treble Wedge Fast, Breech-Loader.

THE WINNING GUN.

At the International pigeon shooting, Monaco, Feb. 1878, the Grand Prix de Casino, an *objet d'art* valued at £169, and a money prize of £105, the greatest prize ever shot for at Monaco, was competed for by sixty-six of the best shots of all nations, and won by Mr. Chalmers, of Fennell, with a full-choke bore Wedge-Fast Gun by W. W. Greener, killing 11 birds out of 12 at 25 yards and 1 foot and 2 1/2 yards. He also won the second event, killing 8 birds in succession at 33 yards, making a total of 19 birds out of 20. This is acknowledged to be the best shooting on record. The winning gun at the choke-bore match, 1877, beating 17 guns by the best London makers, and winning the silver cup, valued at 50 guineas, presented by Mr. J. Purdey, the gunmaker.

The winning gun also at Philadelphia, 1876, in the pigeon shooting match between Capt. Bogardus and Mr. South for \$500 a side, South killing 56 birds out of 100, using one barrel only. The winning gun also at the great London Gun Trial, 1875, beating 102 guns by all the best makers of Great Britain and Ireland. THE PATENT TREBLE WEDGE FAST BREECH-LOADER is the strongest and most durable ever invented, and the most successful gun of the period. Patented in the United States, Oct. 5, 1875; No. 163,328. BEWARE OF IMITATIONS OR IMITATIONS.

W. W. GREENER, St. Mary's Works, Birmingham, England.

FEATHER-FILLED GLASS BALL.

PRAIRIE FIRES NEVER SPREAD FASTER

THAN THE SALE OF THIS BEAUTIFUL AND POPULAR BALL.

One Million and a Quarter

have been sold since August, and our moulds are now running night and day filling our constantly increasing orders.

Every Ball made to scale, and no imperfections. **\$1,000** Reward to any one who can find a single ball in ten thousand beyond the maximum weight (two ounces). No thick sides or bottoms. Its uniformity of thickness won it favor from the first, and out of the immense number sold we have never had one complaint.

NO CLOSE DECISIONS.—A Feather-filled Ball once struck by shot, and the tale is told. *It satisfies every one on the instant, and saves all unpleasant work for Referees.*

NO SHORT COUNT.—Every barrel is warranted to contain enough over three hundred to allow for reasonable breakage. Will also contain copies of the Standard Rules for Glass Ball Shooting, for one, two, or three traps.

C A R D.

During Mr. Paine's absence in England his Patents were grossly infringed upon. Glass Balls and Traps of the most worthless description were sold in large numbers. Balls that could not be broken with a cannon were thrust upon the market by thousands. On his arrival home, seeing this state of affairs, he immediately, with his fruitful brain, invented the Paine Feather-filled Glass Ball. American sportsmen are the best judges of its magnificent success.

No Sportsman's Warehouse is Complete without Paine's Feather-filled Glass Balls. Men and Boys, from Maine to California, shoot at them! Old ladies darn socks on them! Children learn Geography on them! Babies cut their teeth on them! If you want a Ball for main strength and endurance try some other.

WARNING TO ALL.

The following will show how fully we are protected in the manufacture of the Paine Patent Feather-filled Glass Ball, and as the price is SO LOW there is little or no incentive beyond curiosity to infringe on the Patent:

UNITED STATES PATENT OFFICE.

IRA A. PAINE, OF NEW YORK, N. Y.

IMPROVEMENT IN CLASS-BALL TARGETS.

Specification forming part of Letters Patent No. 196,379, dated October 23, 1877; application filed September 22, 1877.

To all whom it may concern:

Be it known that I, IRA A. PAINE, of New York City, in the County and State of New York, have invented a new and useful Improvement in Balls for Trap Shooting, of which the following is a specification:

The figure is a side view of one of my improved balls, part being broken away to show the construction.

The object of this invention is to furnish balls for trap-shooting which shall be so constructed as to "make the feathers fly" when broken by the shot, producing the same effect as when birds are struck by the shot.

The invention consists in a hollow glass ball for trap-shooting, filled with feathers or other light material, as will be hereinafter fully described.

A represents the ball, which is made of glass, is smooth upon the outer side, and has a neck upon one side for placing it upon the trap.

For sale by all Dealers in Sporting Goods throughout the world.

The ball A is filled with feathers B or other light material, as shown in the figure, which, when the ball A is broken by the shot, will be scattered through the air, showing that the ball was broken by the shot, and producing an effect similar to that produced when a bird is struck by shot, and enabling the marksman to see the effect of his shot, the smoke having time to disappear before the feathers can possibly reach the ground.

Having thus described my invention, what I claim as new, and desire to secure by Letters Patent, is—

A hollow glass ball for trap-shooting, filled with feathers or other light material, substantially as herein shown and described.

Witnesses:

JAMES T. GRAHAM,
C. SEDGWICK.

WALLACE & SONS, Agents, N. Y. City.

Bogardus' Patent Rough Glass Balls and Glass Ball Traps.

These Traps are the only ones that give satisfaction, as they are simple of construction, easily set, and not liable to get out of order, and they throw the ball in a manner that more closely resembles the flight of a bird than any other trap in the market. The Patent Rough Glass Balls are made of uniform weight and thickness, and have a corrugated surface that strengthens the ball for shipment to any part of the country, prevents the glancing of shot, and thereby insures the breaking of the ball when hit.

CAPTAIN BOGARDUS was the first to introduce the ROUGH BALL, and at a price far below the smooth ball at that time.

Balls and Trap can be ordered through all Gun Dealers. Liberal discount to the Trade.

Liberal discount to the Trade. The option of the puller, is now ready for the market. Price \$8. Old style, \$6. Parties buying glass balls will receive score book for glass ball shooting, containing 10 pages, in each barrel.

Marooning.

FROM KEY WEST TO CEDAR KEYS.

I BECAME tired of commanding the household brigade, would not give a farthing for a sail on a river or placid lake, and as I longed for a sniff of salt air and life, *al fresco*, I determined on a cruise from Key West to Cedar Keys. As the success and comfort of a boat cruise depends to a great extent upon the boat and outfit, I am disposed to give others the benefit of my experience. I required a boat that was transportable by steamer and railroad; one that would sail in a heavy dew (that is to say when the dew was about ten inches deep on the marine meadows), a boat that would row and pole easily; and as I proposed taking wind and water as I found it, I deemed it necessary to provide myself with a staunch, able and sea-worthy boat. I made a model and A. G. Chappell, of this city, constructed a craft to meet my requirements—and I may remark that if any of your readers intend visiting Florida and require boats of any description, that I can recommend Mr. A. G. Chappell as a first-class builder and a reliable man. My boat was named the Doni. She is sixteen feet long, six feet beam; clean entrance and run; somewhat flat on floor and rather wall-sided midships—in other words she possesses good bearings. Having subjected her to the most severe tests, I cannot improve on the model. Deck abeam from stem to stern six inches; convexity of deck midships from side to side four inches. At forward part of cockpit she is eighteen inches between carlines and floor. To protect the cockpit in sea way, I use three moveable bracketed pieces of wood. The centre one fitting on to the centre of the forward combing; the others on the side comings, one foot from the afterpart of the cockpit. The after pieces have an inch hole in each, and the centre one terminates in a rounded end, which fits into the holes of the side pieces. By this arrangement I secure a substantial frame elevated at the after part and centre one foot above the combing. Over this frame I place a canvas tarpaulin, which is fastened to each side of the boat, and through the medium of which I dispense with the necessity of shipping seas. I provided a 10-ounce duck tarpaulin twelve feet long, which was thrown over the boom at night and fastened on each side of the boat; the front of the tent was closed with two half aprons attached to each side, and lashed in the centre and to screw eyes in the deck. When my tent was in position and lashed in place supported by truss and throat balliards, I had six feet of room between boom and floor of cockpit.

In the after part of the boat under deck is a locker measuring two feet fore and aft. In front of this was a moveable box arrangement, furnishing a locker and seat on each side, as high as under surface of deck; in the centre was a depressed portion to enable me to reach after-locker. The after-locker furnished stowage for boat compass, ammunition, clothing and other plunder. The box on one side received pots and pans, the other, with central portion, enabled me to carry firewood for two days' consumption. On one side of the cockpit under the deck I had a rack for gun and rifle, and on opposite side a similar arrangement for rods and maps. Below and on face of racks I fastened boards eight inches wide, inside of which was stowage for many things. I tacked a width of canvas to the inner face of the combing on each side forming curtains which protected contents from rain or spray.

Cruising among mangrove islands and marshy places, makes it difficult at times to find a suitable camping place, and I always carry a stove, and cook and sleep on my boat. I have a two-hole Etna stove, and carry a light wooden box in which it fits snugly. When not in use the box is placed abaft the trunk, furnishing a seat, and if required, moveable balliard. When wanted for cooking, the lid of the box is placed on the after part of the boat, and the stove on it. The box furnished stowage for stove, pipe, frying-pan, etc.

In addition to the impedimenta mentioned I carried a barrel of pilot bread packed in starch boxes, three five-gallon kegs for fresh water; 16 pounds breakfast bacon; 18 pounds lard, 6 pounds ground coffee in tin box, 8 pounds sugar, 6 cans condensed milk, half bushel Irish potatoes, 1 peck onions, 1 gallon of kerosene oil in bottles (stowed under floor), salt, pepper, matches, pots, plates, cups, knives, ax, shovel, pail, boat compass, tobacco, nails, screws, tacks, saw, palm, needles, gimblet, hammer, oyster knife, charts, tackle, ammunition, mattress, blankets, pillow, and other plunder. By economizing space and careful stowage I had ample room to work my boat. When my canvas tent was erected I would stow stove-box and water-kegs on deck, which would give me a clear cockpit and two feet under deck on each side of the trunk. I occupied the space to the right of the central line, and my fifteenth amendment the other side. In addition, I carried a grains, crab-net and oars on deck, and a sixteen-foot light pushing pole lashed under the boom. I have been somewhat minute with reference to fit-out and stowage, for when a party range beyond the reach of stores and mechanics they must be prepared for an emergency. In many places a light spruce pushing pole will be found very useful.

I left Jacksonville on Thursday, the 29th of October, by the lumber train, and reached Baldwin at 3 p. m. Thursday morning I was en route for Cedar Keys by the Fernandina and Cedar Keys Railroad. Reached Cedar Keys at 6 p. m., and on arrival proceeded to the Island House, kept by Dr. MacIvaine, and to others I will say, go and do likewise. The Doctor has made many improvements in the house, and guests will be pleased with the table.

Friday morning I unloaded the Doni and placed her on the deck of the steamer Cochrane, bound for Key West. Miller and Henderson and Capt. James McKay, of Tampa, have placed on the route between Cedar Keys and Key West two staunch steamships, the T. J. Cochrane and the Lizzie Henderson. These vessels are new, staunch and sea-worthy, have ample power, and are comfortably fitted up for passengers. The officers are experienced on the coast, and are gentlemanly and obliging. These vessels leave Cedar Keys on Tuesdays and Fridays at 4 p. m. To Florida visitors who wish to extend their trip beyond the beaten track, and enjoy the balmy air of and a short voyage on the Gulf we would say take a trip on the Cochrane or Henderson to Key West and return.

I left Cedar Keys on Friday at 4 p. m., and reached Key West on Sunday at 9 a. m. Key West is a pleasant city of about 12,000 inhabitants. The principal occupations of the residents are cigar making, fishing and sponging. The citizens are remarkable for their hospitality and attention to strangers. The climate during the winter months is pleasant, and frost is unknown. There is one large and airy hotel, where fair food and accommodations can be obtained for \$3 per day or \$60 per month. We were informed that several excellent private boarding-houses exist, where good accommodations can be obtained at from \$10 to \$15 per week. I arrived at the conclusion that prices for everything ranged higher than in Jacksonville. The gunnist will find no use for his weapon in the neighborhood, and the piscator will be forced to visit the reefs to enjoy his favorite sport. On my arrival I met several old acquaintances and made many new ones, and all endeavored to make my brief stay of twenty-four hours as pleasant as possible. In my wanderings about town I noticed in many gardens cocoa nuts, sopedillas and other tropical fruits; but, as an old Rosarian, I was charmed with an arched trellis twenty feet long and ten feet wide, covered with a large plant of Mareschal Niell rose. The tips of its long and luxuriant shoots were clothed with blooms—such blooms as I never expected to see on my favorite rose. The external layer of petals were mottled with pink, and the inside ones were of the deepest yellow. I stood at the fence entranced with the beauty of the golden flowers which I coveted, and nothing but the fear of the lock-up prevented me from violating one of the commandments. In my wanderings I noticed geraniums, pelargoniums, verbenas and salvias in bloom; and the beautiful boreganilla growing apparently uncared for, and covered with floral beauty.

Monday morning found me moving at 4 a. m., and by 9 a. m. the Doni was rigged, water kegs filled, plunder stowed, and the crew, consisting of "Al Fresco" and Fifteenth Amendment Aaron, were under way for the main land sixty miles distant. At this point we cannot refrain from referring to the kindness extended to "Al Fresco" by Captain Phillich, Dr Harris, the editor of the *Key of the Gulf*, Captain Smart, and others of the good people of the beautiful island of Key West. The day was pleasant and warm, the wind dead ahead. We left the westerly keys on the port hand, and at night anchored under the lee of Hurricane Key, twenty-five miles from starting point. With the exception of Bocaueca channel, over the entire distance the water was shallow, varying from two to six feet. At many places bars will obstruct the movements of a boat, but by keeping a good lookout passes will be discovered and no difficulty will be experienced in navigating a boat of light draft. At bedtime weather looked threatening, and I felt in my old barometric bones that I would have to fight an old-fashioned nor-easter on the morrow. But, as I had weathered many such on many oceans, I turned in and slept as becometh a marooner.

Tuesday I was up at 5 a. m., cooked breakfast, stowed plunder, and was ready to start at daylight. During the night wind had increased to a gale, with severe rain squalls; but, as there appeared nothing very attractive about a mangrove island, I resolved upon attempting the passage over the Bay of Florida. Up anchor and left the protection of the island; wind blowing a gale; heavy sea with *quantum suff* of rain. Beat until 1 p. m.; made about six miles, and as I was not disposed to spend the night at sea with a gentleman of the colored persuasion, who knew nothing about sailing a boat, I put about and anchored under Spanish Key.

Wednesday, repeated the dose of early rising; wind blowing a gale; heavy rain squalls; high, choppy sea; rapid tide running at right angles, with wind piling up the water irregularly, and rendering the motions of a small boat anything but pleasant or enjoyable. Left anchorage at daylight and attempted to cross the bay; weather more threatening, squally with heavy rain; every wave broke over the noble little craft, but she proved to be able and sea-worthy. At 11 a. m. I had made about six miles against a head wind and sea, and I deemed it best to beat a retreat, and came to anchor under Bay Honda Key, thirty miles from Cape Sable, my objective point. After coming to an anchor, I cooked dinner, and before stowing stove, threw ashes and cinders overboard, and several cat-fish showed themselves on the surface to ascertain what was the matter. Taking the hint, I rigged pole and commenced fishing. This species is more slender than those

of northern waters; the skin is very white and the fins long; spines long, slender and barbed. I captured several before one came in contact with the knuckle of index finger of right hand, and one of the spines entered about half an inch. I instantly removed the unpleasant appendage, and an intense burning pain succeeded. In a very short time my hand commenced swelling, and I suffered much from pain. Old Aaron had several plugs of knock-me-down tobacco, and I resolved upon applying a sailor's remedy. I carefully separated a number of the leaves from a plug, moistened them in salt water, and applied to the hand. I passed a restless night in consequence of pain. In the morning my hand was swollen and stiff, and several days elapsed before the swelling disappeared. As I write, two months after the reception of the injury, the knuckle is tender to the touch. From all I can learn, they are more poisonous than their relations in northern waters. *Memo.*—When you catch a Gulf cat-fish hit him on the head with a shillelah before removing him from the hook.

The Florida Keys extend from the Tortugas to the Miami river. They vary in size from small to very large islands. Some are covered with mangrove bushes, and others with pines and cabbage palms. During severe hurricanes nearly all are subject to overflow. Under the mangroves at some of the islands snapper, grouper and large craw-fish can be captured. Under ordinary circumstances, a cruise among these keys is pleasant. With the exception of Bay Honda channel, the water is shallow, and by working to the northward and eastward until lower Maticombe Key is reached no difficulty will be experienced in reaching the main land fifteen miles east of Cape Sable. By taking this course a harbor can be made at any time under one of the keys. An accurate survey has been made of this region by the government, and five large charts have been published, the expense of the set being \$7.50. These charts show all the islands, surfs, channels and bars. My object was to reach Cape Sable by the shortest road, and I resolved not to take the longest way round.

Thursday—Up early, breakfast cooked, and dishes polished with waste paper. From Bay Honda Key to Cape Sable, thirty miles; gale still blowing, and dead ahead, with heavy sea; occasional showers of rain; no lee or protection unless I made for Sandy Key, eight miles to the west of my course; land swollen and somewhat painful. Becoming annoyed at my back-track proceedings, I resolved upon making the mainland. Daylight saw the anchor on deck, and the Doni in Bay Honda channel. The ball opened and dancing commenced. We lacked the music of a brass band, but the whistling of the wind against the balliards supplied the want, and the Doni danced a fandango. I shall refrain from minutely describing the motions of the boat and crew, and how the brine was distributed. After the channel was crossed, the wind hauled more to the eastward, the rain ceased, and Old Sol winked at us occasionally. Sea was heavy, but we were at last enabled to lug a cruise to Cape Sable, under the lee of which we arrived at half-past one, thankful that the lumpy surface of Bay Honda was in the rear. With a free sheet we bore to the northward, within a stone-throw of the shore.

From the best information obtainable, at a point about twenty-two miles east of Cape Sable, and southwest of Key Largo, will be found the Hallalachee River, which is reported as being navigable for small boats, and by which White Water Bay can be reached at its easterly end. I found one party who had attempted to enter it, but the tide was low, and his boat grounded on the mud flats. This whole section is a *terra incognita*, and is worthy of the notice of boatists, and the time may come when Al Fresco will unravel the mystery that surrounds it. I have questioned many old coasters, fishermen and spongers, regarding the lower portion of the peninsula, and I find that they are ignorant as regards everything inside of the coast line. They are acquainted with the headlands, a few islands and channels, but the rest is a blank.

Correctly speaking, there are three capes—East, Middle and North Cape. At East Cape Sable a stake will be noticed; twenty yards inland from this, an earthwork, the remains of Fort Point, and fifty yards back of this a well with good water. About half a mile to the westward of the middle cape is a clump of about one dozen large trees, and thirty yards from the beach a well of excellent water. If mariners cannot find the wells, potable water can be obtained by digging a well two or three feet deep, in a low place a hundred or more yards from the beach. At one time a noble grove of royal palms existed in this locality, but all were destroyed by the hurricane of '74. One stump, about fifteen feet high, is still standing as a sentinel over the departed glory of what was once a truly royal grove. The middle cape is easily distinguished by the existence of a small prairie (described by Vignolles in 1823 as the "Yamasee Old Field"), in the front a few mangrove bushes, and in the rear some cabbage palms. From information received, a lagoon exists within half a mile of the beach, emptying into Cape Sable Creek. During the winter months this is a favorite resort for ducks, and the surrounding country is stocked with deer and turkey. Unless the wind is from southward and westward a landing can be made on the beach, as there is no swell or undertow as on the Atlantic. About a month before my visit Dr. Harris' men were proceeding from Rogers River to Key West, and noticed a man on the cape making signals. They took him on board, and found that he was a Dutchman, and had been three days without food. It was ascertained that he had purchased a yawl-boat at Key West, and had started for Cedar Keys. He was caught in a gale, and boat was wrecked on the Cape. He remarked that

he had been hunting for a farm-house for three days, but could not find one. A few years since a Key Wester located on Cape Sable and engaged in the culture of cabbages and pineapples. He prospered, but one day a hurricane came along and washed his family and improvements inland. For the benefit of cruisers, I may remark that aerial whirligigs never occur during the winter months, and the only cause of complaint will be too frequent calms.

To the north of the middle cape I sighted and entered Cape Sable (a navigable stream) with the intention of camping. I landed on a sand bank, but such landing was made a few weeks too soon, for I was greeted by a cloud of sand flies, and myriads of insects, which immediately instituted phlebotomizing operations. When entering the creek a small schooner belonging to Dr. R. Harris, of Key West, was seen working to the northward, and I followed. She entered and anchored for the night in Shark River, and I made fast to her stern. The entrance to Shark River can be easily found, for on its southern side there is a projecting point, densely covered with tall mangroves. In this connection I have a shark yarn to spin, but as it is too fishy for this issue I will keep it for the next.

AL. FRESKO.

For Forest and Stream and Rod and Gun.

A SUMMER VISIT TO THE GULF OF ST. LAWRENCE.

THE securely sheltered and romantic harbor of Gaspé is situated on the easternmost promontory of the Province of Quebec. A weekly steamer from Montreal calls here regularly during the season of open navigation, and a jolting old cart, called for courtesy's sake a mail coach, filled the intermediate gaps of postal communication. There was a time when Gaspé had the monopoly of the vast trade in fish, which then abounded in incredible masses at the mouth of the great St. Lawrence. There was a time when sails of various sized fishing and trading craft could be counted by the hundreds, riding safely at their anchors on the glassy surface of this picturesque bay, but these glories are now only memories of the past, never to be revived, and buried from the hour when the steel tape of the intercolonial road monopolized the bulk of the trade between Quebec and Halifax. The noise and hustle once animating Gaspé are gone, the lazily-winged seagull dips her pointed pinions with a restored sense of security into the green water of this fairy nook, now but seldom ruffled by the cleaving stroke of the oarsman, and the cormorant has no pursuers to fear, as he wings his way each morning and night to and fro the steep rock of Percé which houses his hungry brood. A few trading schooners, an accidental fishing smack, and the weekly arrival of the mail steamer alone impart some liveliness to the scene, so much more charming to him who flies from the noise of the great cities to these calm, ocean realms, where nature alone rules supreme.

The steamer had delayed just long enough at Percé to afford us a passing glimpse of its famous rock, with its feathered inhabitants, and enters toward afternoon the undulating *embouchure* of the Dartmouth, St. Johns and York rivers, which bury here their fresh crystal floods into the bosom of their great parent. It is, no doubt, owing to their agency, continued throughout ages, and aided formerly by a powerful ally—ice—that the bay resembles somewhat the huge terminal funnel of a great glacier, which would have found sufficient slope for onward movement from the mountains beyond, which, even now, after all these denuding influences, still tower up toward the clouds. The history of the dim past is written here with imperishable characters upon the hard rock, jutting out seaward upon the honey-combed coasts, and the flat-topped hills facing the shore. They tell us of the great changes which they have witnessed; how there was a time when massive walls of moving glaciers extended beyond the green waters which now separate Nova Scotia from it; how, again, this frigid barrier slowly sank beneath the level of the ocean, and slowly emerged from its watery grave, with its memoirs written upon the surface of its hard rock by the tracing pencil of living ice, such as is recorded still in the mountainous gorges of the Swiss Alps. The eye, as the steamer moves ahead from point to point, never grows weary of reading the pages of this stony library of nature. It views huge, deep groovings, sculpturing the coast line, which soon will recede whenever overhanging rocks are undermined, still more by the yet active wearing power of the breakers and drift ice. The little town at the foot of this ancient glacial gorge is reached at last. It is scattered picturesquely about the sloping hills of the bay, which is here hardly a mile wide. The houses are unostentatious, clean and neat, and the residence of Mons. Le Boutillier alone, surveying from its imposing eminence the little dwellings beneath it, gives evidence of what wealth may do when combined with taste. There are only a few craft lying at the wharfs and midstream. They are owned by this gentleman, who controls the fishing interests of this whole section of the Dominion, and who, by means of his sagacity and activity, has become a sort of an aquatic patriarch over hundreds of families, who look to him exclusively as the great absorbent and transformer of their finny gains into the necessities and comforts of their clean and frugal homes. Beyond these and the graceful contour of the government surveying steamer, "Lady Head," taking in needed supply of coal, nothing indicates any communication with the busy world beyond. The place, however, is gradually becoming a summer resort of the tourist, since his Excellency Lord Dufferin has the fishing privileges of the York river, which, as a devoted sportsman, he annually visits with his numerous retinue. His precepts are followed by Mr. Fred Curtis of Boston, who is known on these shores wherever a salmon will take the fly, and who never fails to reap the cream of sport of the lovely Dartmouth, of which he is the lessee. It is through the kindness of this gentleman that we enjoy while at Gaspé commodious quarters and a well furnished table.

We had thus far in vain searched the coast from the Bay des Chaleurs for the breeding grounds of the swarms of birds which left us with early spring for their northern breeding grounds. We encountered only here and there scattered colonies of gulls, cormorants, gannets, and puffins, which burrow into the soft, yielding covering of the earth-like promontories and islands all along the sea coast. Our baggage is still bulky from the great amount of unused ammunition, which has awaited in vain a fair field for expenditure. The marshes and flats near the sea shore present here in August an even more lonely aspect than along the line of the Chesapeake Bay, where the visitor may look for a fair bag of godwit and rail;

and Gaspé, though renowned for fishing, offers no inducements to sea-shore or marsh fowl, as the land rises steep and abrupt. The notorious island of Anticosti, however, is only sixty miles distant, and to its lonely, desolate shores the imagination strains its gaze, and enlivens them with the lost tribes which have winged their way to the undisturbed solitudes of their northern breeding grounds.

There is now, fortunately, a semi-monthly mail schooner leaving for Anticosti and the southern coast of Labrador, called here the north shore; but we arrive, unfortunately, just twelve hours too late, and thus lose our chances in her for a passage. The disappointment, however, is reversed on learning that Mons. Le Boutillier himself is on the point of leaving in his own vessel for an inspection of his several fishing stations on Anticosti and Labrador, thereby following in the wake of the departed mail boat, and making withal a more extended round of visits. We share with him the cabin of his clean and neat vessel, and also in virtue of his social hospitality many little unmentionable luxuries, not included in the regular bill of fare, which limits the prescribed liquids to coffee and tea. The wind and tide are fair, a soft summer breeze swells the sails of the white winged craft, the bold promontory of Ship's Head is rounded, and soon fades in the misty horizon, while the good southwest wind carries us, toward noon, in front of Griffin cove, a little fishing settlement thirty miles north of Gaspé.

C. D.

Fish Culture.

SALMON IN THE MISSISSIPPI.

The Secretary of the American Fish Cultural Association has received the following letter from W. W. McDowell, Esq., of Memphis, which sets at rest the question as to whether the *Salmo quinnat* are now in the Father of Waters. The introduction of the salmon in the Mississippi is mainly due, then, to Mr. McDowell, and all fish culturists will doubtless unite with us in congratulating this gentleman on this important event, which is entirely due to him. Now let a law be passed—if such does not exist—prohibiting the catching of salmon in the Mississippi or its tributaries for the next three years. A close season until 1880 is what is wanted. As to these salmon being ripe in February and March, as stated by Mr. McDowell, circumstances may have changed somewhat the habits of the fish. We shall await the opinion of Professor Baird in regard to this:

MEMPHIS, TENN., March 11, 1878.

To the Secretary of American Fish Cultural Association:

DEAR SIR—Your letter of inquiry of the 12th ult. is received and read, and I take pleasure in responding.

Early in December, 1875, I applied to Professor Spencer F. Baird to plant some young California salmon in Wolf River, near Memphis. Professor J. W. Milner replied that he had a large quantity at the U. S. Hatching House in Michigan, but had no money to pay for their distribution, and that if I would pay the expense of sending them he would send them at once. The fish arrived here on the 26th December, 1875, and I paid the expense—\$165. The fish were placed in Wolf River about two miles from its mouth. This river empties into the Mississippi River, in the northern part of the City of Memphis. When the fish were placed in the river the Mississippi River was higher than the mouth of Wolf, and if the young fry proceeded up stream as soon as they were placed in the river, they went down the river to its mouth.

Last spring our fishermen reported a few salmon here, but I did not see any. But within the last thirty days I have seen a good many at our fish market. They are caught every day near the mouth of Wolf River. They weigh from one half pound to two pounds.

I bought one that weighed one and a half pounds. It measured nearly 18 inches in length, and was 9 inches around the body. It had spots upon its sides, which reminded me very much of the spots upon a rattlesnake. I never saw a California salmon, unless these are, and therefore I cannot say whether they are or not. I have arranged, however, to send one to Professor Baird, which will settle the matter. I am inclined to the opinion that they are the same fish placed in Wolf River, because, if they were only passing here, they would not be caught here every day for thirty days.

One of them which I bought was almost ripe for spawning; and if the California salmon only spawn in the fall, this fact would throw doubt upon my view of their origin.

One thing is certain: I never saw their like before.

Yours, truly, W. W. McDOWELL.

THE SALMON IN THE HUDSON.—In our last issue we gave some brief account of a salmon said to have been found in the North River near Peekskill. Our correspondent is good enough to give us full particulars. We think there can be no doubt but that the fish caught was a salmon:

EDITOR FOREST AND STREAM:

Your letter of the 15th asking for further particulars in regard to the salmon lately captured in the Hudson near our village is received. In reply would say, first, that it was taken in a seine not *siere* as printed. It was caught by Henry Conklin and sold to Messrs. Bedell & Crook, fish dealers, and it was while in possession of said firm that I saw and examined it. They thought it a female which had finished spawning, and were confirmed in their belief on dressing the fish. It presented all the characteristics of the *salmo salar* in the spawning season, including the peculiar cartilaginous hook growing from the lower jaw. Judging from its size the fish should have weighed from twelve to fifteen pounds, but as I said before, it was in very poor condition, the flesh being soft and flabby and the color not so rich and deep as in a fresh run salmon. It had been purchased before I saw it by the pastor of one of our churches, who tells me that he did not know of what species the fish was when he bought it, but that it proved fine eating, with a decided trout flavor. Have made arrangements to secure for you any smaller one of this kind that may be taken; but they are rarer now than they were a year ago. I hear that the fishermen, not knowing the fish, have been in the habit of throwing away the smaller ones, but do not think they will do so in the future. Hoping it may not be many years before the capture of this noble fish in our beautiful Hudson will be a frequent occurrence, I remain yours, very truly,

Peekskill, N. Y., March, 22.

SALMON FRY.—Mr. E. G. Blackford has had, rather on exhibition than on sale, a number of small salmon consigned to

him from Peoria, Illinois. These fish were hatched from the egg of the California salmon in 1875, and are some six inches long, weighing about $\frac{1}{4}$ pound each. These fish are the overstock of certain ponds in Peoria, Ill. It seems a pity to waste the fish, as they are not good to eat, being tasteless and poor.

SALMO QUINNAT.—Mr. A. F. Clapp, whose excellent articles in the *Sunbury Gazette* on fish culture and the laws governing game in the various States have excited so much interest, informs us that the *Salmo quinnat* deposited this spring, in the Sinnemahoning (one of the largest tributaries of the Susquehanna), are doing quite well.

CALIFORNIA TROUT IN THE EAST.—The following letter from Seth Green, Esq., furnishes interesting and gratifying news. We believe this is the first instance where spawn have been taken from California mountain trout in the East. Possibly we are to enjoy a new sensation one of these days in new varieties of hybrids, which will afford pleasure to the palate and sport to the angler:

ROCHESTER, N. Y., March 19, 1878.

Mr. Editor—Two years ago the California Fish Commissioners sent us some California mountain trout spawn. We raised quite a good percentage of them, and now they are in a thriving condition in one of our ponds, at the New York State Hatching Establishment, Caledonia. On the 14th of March they commenced spawning. We have crossed a few hundred of them with our native brook trout, and should think the hybrids would make a good fish for our waters; but time will tell.

The California trout are a hardier fish than ours, and more easily raised.

We have made other crosses this season, of the results of which more will be said another time.

Yours, SETH GREEN.

WHITE TROUT—LUDLOW TROUT PONDS.—Editor *Forest and Stream*: It is a common thing in every trout hatching season to find an endless variety of deformed trout, such as double-headers and crooked backs, etc. But this season nature has taken a fancy to try something new, or at least it is new to me. I have now in our hatching house about 30,000 brook trout fry of this year's hatching, and among them I have two (2) trout that are white, or a very light cream color; they are perfect in form. They were hatched about the 12th of February, and they are growing and doing as well as the rest. Have you ever seen or heard of any white brook trout before? I would like to hear.

B. FNEBURE, Supt.

Ludlow, McKean Co., Pa., March 20.

We never have seen or heard of white brook trout. Will our fish breeders be kind enough to report. We have seen light pink and cream-colored goldfish (carp).—Ed.

—Fifty thousand salmon trout were placed in Greenwood Lake on the 22d inst.

UNITED STATES COMMISSION.—The navy of the United States Fish Commission, consisting of a small fleet of scows, fitted up for the purpose of hatching shad at Avoca, near the mouth of the Roanoke River, Albemarle Sound, took their departure from Baltimore in tow of tugs last week. The steam apparatus devised by Major Ferguson, the Maryland Commissioner, is employed.

—One of our Nashville, Tenn., correspondents has been shown a young jack, the product of some eggs (of the Virginia species of jack) deposited some months ago in the reservoir by Major G. F. Akers, of this city.

WISCONSIN.—Alfred Palmer, Fish Commissioner of Wisconsin, writes us as follows:

"We shall plant in the public waters of Wisconsin this year about ten millions of white fish, three millions of lake trout, and two hundred thousand brook trout."

Natural History.

UNA AND THE LION.—An unusual fancy that of Mrs. M. E. Lincoln, a Boston lady, who has for her household pets two magnificent African lions. Well behaved lions they are too; perform their mistress' bidding with unswerving obedience, but always with becoming dignity; go through a variety of tricks, and conduct themselves, in all respects, as civilized lions should do. Before the Boston police interfered, these pets had the free range of the whole house and the garden. Now they are confined to one room, with a run in the yard. Our ideals of pets are these two great, good-natured brutes. But we must confess we fear that some day their lion nature may arouse. Mrs. Lincoln has done a great thing for us in showing the influence of woman's kindness over the fiercest brute creation. Nothing excites in us greater indignation than the sight of the poor, scared beasts of the menageries shrinking and cringing before the hot irons of their keeper. We shall study with interest Mrs. Lincoln's experiment, of which she has kindly written us, as follows:

54 HOWARD ST., BOSTON, March 16, 1878.

EDITOR FOREST AND STREAM AND ROD AND GUN:

I have two African lions, male and female, named respectively "Willie" and "Marthy." I originally possessed four cub lions, but lost two in raising them when they were quite young. "Willie" was born in Houston street, N. Y., June 4th, 1876, and "Marthy" was one of another litter, born three days later, corner Eighth avenue and Forty-ninth street, New York City.

From the day they were born I have had sole charge of them. I at first brought them up on a child's nursing bottle, but they have long since changed from milk to fresh, raw meat, which they eat from my naked hand. They are now twenty-one months old, and good judges pronounce them the handsomest pair of lions ever raised in this country, and probably the only pair of African lions ever raised in America. "Willie" weighs about two hundred and fifty pounds, and

is a noble looking king of the forest, and will be a large specimen of the rare black-maned lion.

As a general thing, a lioness is most fierce and ferocious looking; but "Marthy" seems to be an exception to the general rule, as she has a fine looking face, although her eyes look a trifle roughish.

They have become very much attached to me, and are as well pleased to see me, after a few hours absence, as children. They are quite affectionate, and love to be petted, although they take but little notice of strangers. They have never shown any disposition to do me an injury of any kind.

Yours, respectfully, M. E. LINCOLN.

ZOOLOGICAL SOCIETY OF CINCINNATI.—The Report of the Zoological Society of Cincinnati for the year 1877 is an evidence of the success of such an institution when conducted with the ability shown by the managers of this society. The total receipts of the Garden for the past year were \$6,186.93 in excess of those for 1876. This is an indication that the Gardens are gaining increasing popularity as a pleasure resort. The success of the present efficient manager, Mr. H. P. Ingalls, and his assistant, Mr. Frank J. Thompson, in their care of the specimens under their charge, is a subject of much congratulation among the trustees. The total number of specimens in the Garden, Dec. 31, 1877, was 885, of which were mammals, 317; aves, 528; reptilia, 38.

In Cincinnati, as in New York, the sea lions are the great objects of interest, and curious crowds are always to be found about their pond. In the report we find this very curious incident:

"The successful rearing of a pair of lion whelps by a female leopard, who acts as foster mother to them, is one of the most interesting features of the entire menagerie. About three weeks after their birth the mother ceased to take any notice of them. A Newfoundland slut was immediately procured, which nursed them for a short time, after which they were transferred to the care of the female leopard and young. She instantly took them in charge, and since has evinced the same love and care for them as for her own whelp. They are still under her motherly protection, and are growing to be fine, hearty specimens, constantly playing and tumbling about the den with their foster sister."

THE LINNEAN SOCIETY OF NEW YORK.—There was organized in this city, on the evening of March 7, under the above name, a society which promises in the future to do good work for American science. That this is true no one will doubt who reads the names of the ten founders, all of whom are well known to workers in their several departments, while several of them have a reputation which is more than merely local. The object of this society is the promotion of the study of Natural History in its widest sense, and we do not hesitate to predict for it a future of great usefulness. The strength of the organization will be seen in the following list of original members: John Burroughs, Harold Herrick, H. B. Bailey, of Cambridge, Ernest Ingersoll, Fred H. Hoadly, M. D., E. P. Bicknell, Will C. Osborn, Franklin Benner, C. Hart Merriam, Newbold P. Lawrence. The officers of the society are: Pres., C. H. Merriam; Vice-Pres., H. Herrick; Sec'y, E. Ingersoll; Treas., H. B. Bailey. At a second meeting a constitution and by-laws were adopted, after which Mr. E. P. Bicknell read an extremely interesting paper on the "Winter Fauna of Riverdale-on-the-Hudson and Vicinity." We tender this band of young and vigorous workers our best wishes for their success.

A LARGE AMBLYSTOMA.—A correspondent sends us the following note, and desires to be informed on the points mentioned. In reply we may say that the so-called "lizard" was apparently not a lizard at all, but one of the *Urodela*, or Tailed Batrachians, an order belonging to the class *Amphibia*, which includes frogs, toads, newts, sirens, etc. The description applies so well to *Amblystoma punctatum* that there is little doubt that the animal belonged to that species. It was, however, an unusually large specimen. Lizards always have a rough, harsh and scaly skin, while the *Urodela* is always soft and tender. Our correspondent's note reads as follows:

"On March 7, while having an old hot-bed dug out, a very large specimen of the lizard tribe was unearthed by the spade. I would have forwarded it to you for examination, but found it almost impossible to touch or manipulate it in any way, as it was so tender and soft that its skin abraded and burst at the slightest touch. I inclose accurate measurements and description of the reptile, and would like to know what it is and if commonly found so large in this latitude. Total length, 8½ inches; length of head, 1 inch; breadth of head, ¾ inch; length of body between front and hind legs, 2½ inches; length of tail back of hind legs, 3½ inches; front legs, ¾ inch long, 4 toes; hind legs, 1 inch long, 5 toes; color on upper side of head, back, tail and sides, bright bluish black, interspersed with thirty bright yellow spots ¼ inch in diameter, two similar colored, but smaller, spots on each leg; color of sides, lighter shades of blue, verging upon white on belly, and speckled with minute white spots; sides were marked with transverse indentations running regularly from near head to nearly the end of tail; weight, about ¼ lb.

ANOTHER LITTLE AUK.—Upon reading "A Little Auk on Shore" in a late number, I was reminded of one that I found under very similar circumstances about three months ago. I was spending a few days, gunning, at Chatham, Mass., in the latter part of November. Upon my return from a ducking trip late one afternoon, while passing through a field just outside of the village, a white object in the grass struck my eye. Upon coming nearer I found it to be the breast of an odd-looking bird, still warm, but dead. It proved to be a little auk, and upon my return to the city I had it set up. The field was over half a mile from the water, and the cape is, I believe, at this point, from ten to fifteen miles wide.

Boston, Feb. 23, 1878.

HUNTER.

EARLY SNIPE.—A correspondent, Mr. James Chubb, writing from Cleveland, Ohio, under date March 11, says:

"Was out shooting on Saturday and bagged two Wilson snipe, and think it early and unusual for this place. On looking over my register, which I have kept for years, dating back as far as 1849, I see in that year, or rather '48, I bagged two snipe Dec. 20, and in the spring following, March 25,

bagged seventeen more. This was a very mild winter indeed. The last snipe this season I killed Nov. 20. On March 14, 1850, I killed five snipe; March 17, 1851, two snipe; March 14, 1853, nine snipe; March 17, 1859, twelve snipe; so you find this year is earlier than any year here that snipe have been shot at all. My sons killed a brace a few years since, I believe March 12, but my experience for thirty years shooting has been that a snipe has not been shot here as early as the present brace. I don't mean I've only shot thirty years, as I have shot over half a century, and am able to-day to travel and bag as many head of game as any young man if he doesn't keep his eyes open and embrace every opportunity."

Like all other birds, snipe appear to be coming on much in advance of their usual time. We killed one in Connecticut, March 16, which is considerably earlier than we have ever observed them there before, and they were reported from Massachusetts nearly a week before that date.

MEFORD NOTES.—Medford, Mass., Feb. 23.—Fox hunting prevailed in the neighborhood this week. One that had thrice eluded the hounds during the past two weeks was at last "brought to bag" on Pean Hill, Jan. 10. Early the next day an "old setter" was started in the "backwoods," and after a fine run of ten hours was shot on Bear Hill, in Stoneham, several miles from his usual runs. Not until this week did I learn that the snow bunting (*Plectrophanes nivalis*), had been with us this winter. A small flock was seen on College Hill Jan. 13, but being rather shy and rather disposed to flight, only one bird was secured. I think they have been unusually rare this winter, for this is the only instance of the *nivalis* being seen in this vicinity. Memoir.

WHAT ANIMAL KILLS AND EATS A FOX?—Weston, Vt., March 11, 1878.—I think I can explain the mystery of the mutilated fox found by the Clinton fox hunters. When bitch foxes are caught in a steel trap during the period of heat they are frequently badly bitten, and sometimes killed outright, by dog foxes. Dog foxes are never so treated, nor are bitches, except in season. Why these things are thus is what no fellow can find out. I have caught, by steel trap, between two and three thousand foxes in the past thirty years, and have had many foxes badly bitten and a few killed, as above mentioned. Once I caught the dog fox in the act of killing, having nearly severed the head. I shot him "on the spot." It is very common for foxes to rob a steel trap of animals caught therein by gnawing off the captured leg. The fox never devours his prey on the spot where caught, but drags it some distance away. Bitches are in "season" from December to February, according to age; the oldest are earliest. If there was snow on the ground the hunters ought to have found tracks of the destroyer. CORP'L LOT WARFIELD.

ORNITHOLOGY.—We have received from the Smithsonian Institution the very valuable report of Professor Robert Ridgway, on the Ornithology of the Route of the Geological Exploration of the Fortieth Parallel. It forms a most interesting addition to the other special reports which have resulted from Professor Hayden's survey.

THE ENGLISH SPARROWS IN GEORGIA.—The English sparrows have now spread themselves as far south as Georgia, as will appear from the following letter, dated

MYATLE GROVE, BRYAN CO., MARCH 17, 1878.

MR. EDITOR:

The English sparrows have reached us. I saw one early last week, and yesterday a friend of mine saw another. There can be no doubt about this, as we both watched the birds for some time, and noticed the plumage and movements carefully. These birds were seen on the rice fields, about fifteen miles from Savannah.

GEO. LYMAN APPLETON.

PHILADELPHIA ZOOLOGICAL GARDENS.—The bill recently introduced into the Legislature to close the Philadelphia Zoological Garden on the Sabbath has been defeated.

SNAKE FASCINATION.

St. Joseph, Mich., Feb. 25, 1878.

Many and marvelous are the cases I have heard related of snakes charming persons, birds and small animals. In most discussions some believe, some doubt, and most think if they do it at all, they do it with the eye. Writers on natural history, as far as I know, do not believe they have any such power. The first evidence to any one is his own senses, the only difficulty being that senses do not clearly apprehend the facts and phenomena as they actually exist. To establish any point in natural history is only to clearly apprehend facts as they are. If all the writers on science saw things as they really are, there would be absolutely no disagreement.

That there is a power of fascination, charming, perhaps mesmerism, possessed by snakes is to me a fact, and although it is a snake story, still I write what I know. Snakes can charm—they can fascinate; of that I have had ample experience. At the age of about eighteen, in the town of Lyme, Conn., where I was brought up, my father had a shad fishery on the Connecticut River. One morning in April I was sent to carry a fish to my sister, about two miles distant. Part way there I took a wood road through a rocky and hilly place, where the timber had been cut. Carrying the fish on a little cane stick on my shoulder, my attention was arrested by hearing a rattling in the dry leaves a foot or more from me. Stopping, I looked, and saw a large black snake (*Crotalus constrictor*), five to six feet in length. Some two or three inches from the end of the tail was in rapid vibration or quivering, which made the noise by rattling the dry leaves. I had seen small striped snakes do something like it, and thought nothing of it. I stood to look at it with my stick on my shoulder, not conscious of any danger, having seen and killed, of such snakes, perhaps hundreds. In a few moments the vibration was so rapid that I could only see it without any form. It was like a splint or straw in a strong wind, fastened at one end, so rapid was its motion. Soon after looking at it, the vibrating portion began to show all the prismatic colors with such beauty of combination that no language can describe it. Seemingly, they went through a million of combinations and mingling of colors, changes and recombinations with every tint of shade, instantly. I stood enchanted at the most beautiful sight I ever beheld, unconscious of danger! Did I say enchanted?—charmed—fascinated!

There I stood, lost in ecstasy, without motion—how long I do not know. My eyes at first seemed a little blurred or dimmed. There was a pleasant, dizzy sensation in my forehead. The first I knew I felt myself falling to the ground. The partial falling frightened me, and in saving the fall, it turned my eyes from the snake. I felt dizzy—eyes blurred—muscles and nerves unsteady. In my fright at my condition I went for that snake with my staff. He stood ground, and raised up two

feet or more at me with forked tongue. I awoke without hitting several times. The snake ran, stopped, raised up at me again. I made several strokes, but could not hit him, although raised right in front of me. He ran again, and raised his head, with forked tongue almost in my face. At last, the third attack, I hit him and then killed him. Before getting through the woods I heard another rattling the leaves—I did not look him up.

I made experiments with four others of the same kind of snakes the same summer—none less than five to six feet in length. I had learned to look but a few moments at a time after the first adventure. As soon as the prismatic colors began to appear beautiful I turned my eyes. The last one attempting to charm me, I called two of my brothers who were near. We all witnessed the snake's mode, one at a time. To first arrest the eye they rattle the leaves to make a noise. You turn and look, and instantly the tail begins a rapid vibration, that destroys all distinct appearance of any form. Soon the colors begin to appear and commingle so beautifully that you have no desire to look away or turn your eyes. The longer you look the more beautiful they become, and the more desire to look at them. We looked at the snake alternately, and then would turn each other away. When we all looked away he stopped. Let any of us move, he rattled the leaves; if we looked at him he began to clatter till we looked off. He knew instantly when we turned our eyes from him.

Our experiment continued a half hour, till we were well and fully satisfied of snakes' powers to fascinate, and their mode. I have tried to give as clear an idea of the fact as I can. But no description can be given so that, unseen, it can be comprehended—it must be seen. The mode I give—the tail is raised, and not the eyes. If the serpent of Eden produced the exquisite combination of colors in that fruit that there is in the charmer's tail—well, Eve, I forgive you. LUTRON.

WHO CAN EXPLAIN IT?

NEW YORK, Feb. 27, 1878.

EDITOR FOREST AND STREAM AND ROB AND GUN:

A relative of mine purchased a farm on Long Island last summer, and when he took possession found thereon among the belongings a couple of drakes and one duck. It appeared that the duck had stolen her nest and was sitting under the barn, and in due time, to my relative's surprise, she led forth twenty-five young and lively ducklings. How she covered so many eggs was a mystery; but the problem that suggested itself to my mind was this: If a duck only lays one egg per day (and I do not know that they ever lay more), it must have taken this individual fowl twenty-five days to produce her nestful of eggs, which, of course, would make a difference of that number of days in the age of the first and last egg. Please to recollect this happened in July, the hottest period of the year, and usually an egg becomes stale in three or four days in summer, and is spoiled in a week or so. Now, my first query is, "How were the first eggs preserved from spoiling?" and my second is, "How did the last laid egg hatch at the same time that the first laid did?" for they all came out on the same day. I am aware that ordinarily, in putting eggs under a fowl, they all usually hatch within a day or so of each other; but, in such cases, the eggs are not brooded by the fowl previously, as must have happened in this case. The duck must have sat upon the eggs in the nest some time during each day until the whole twenty-five were laid. I should like some one who is posted on such matters to give an opinion.

Yours truly,

INQUIRER.

[The difference in time between the laying of egg No. 1 and egg No. 25 would not necessarily make any difference in the time of hatching, provided the bird only remained on the nest each day long enough to deposit an egg. Why egg No. 1 did not spoil before incubation commenced is another and more difficult question.—ED.]

CIRCULAR RELATING TO COLLECTIONS OF LIVING REPTILES.—The Smithsonian Institution is at present engaged in the preparation, for exhibition in the National Museum, of a series of plaster casts of American reptiles taken from the living or recently dead specimens, and carefully colored from nature. For this purpose it respectfully invites contributions of the following objects:

First—Specimens of any of the turtles and terrapins found in your vicinity, with information as to whether the collection embraces all the species known; and, if not, whether others may be looked for hereafter.

Second—The largest procurable specimens of serpents, with the exception of the poisonous kinds (such as rattlesnakes, copperheads and moccasins), in reference to the transmission of which farther and special correspondence is requested.

Third—The various kinds of salamanders, water-lizards or ground-puppies, to include the large hell-bender of the western waters, the mud-pup or water-lizard of the northern lakes or *Menobranchius*, the congo eel or ground puppy (*Siren* and *Amphiuma*) of the Southern rice fields, etc., as well as the smaller kinds found in damp places under stones and logs. A series of the frogs will also be acceptable.

All these animals should be suitably boxed and transmitted, as far as possible, alive; or, if dead, packed in ice, so as to insure their coming in good condition. The serpents require no special precautions in the way of packing; if of nearly the same size several may be sent together. If the disproportion be very great, there is, however, danger that the larger may devour the smaller. No rattlesnakes, copperheads or moccasins should be transmitted. The turtles should be wrapped or sewed up in some kind of cloth so as to prevent friction. They should not be sent loose with the softer objects. Serpents require no moisture; frogs and salamanders should be packed with wet moss.

Among the turtles should be included the soft-shell species, the true terrapins, the land tortoises, etc.

Single specimens of any living reptiles, as well as larger numbers, including duplicates, will always be gladly received, and no acknowledgment made for the same. The largest procurable representatives of each species is desirable. Transmissions may be made by any express company, freight to be paid in Washington.

JOSEPH HENRY, Secretary S. I.

SMITHSONIAN INSTITUTION, Washington, Feb. 1, 1878.

ANIMALS RECEIVED AT CENTRAL PARK MENAGERIE FOR WEEK ENDING MARCH 23, 1878.—One black-eared marmoset, *Haplorhina panicea*, and one spella monkey, *Cebus apella*, presented by Mr. W. R. Tice, Brooklyn; two Stanley cranes, *Tetrapteryx paradoxus*, Hab. South Africa; two white-headed doves, *Columba leucocephala*, Hab. Hayti; two wild cats, *Lynx rufus*; three lions, *Felis leo*, bred in the menagerie.

W. A. CONKLIN, Director.

ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDEN, FAIRMONT PARK, MARCH 19, 1878.—One zebu, *Bos indicus*, born in the garden; one Cuban chameleon, presented; one tree toad, *Epicrater angulifer*, presented; two Angora goats, *Capra hircus*, born in the garden; two woodchucks, *Arctomys monax*, presented; one raccoon, *Procyon lotor*, presented.

ARTHUR E. BROWN, Gen'l Supt.

A few gentlemen wishing to join a first-class shooting and fishing association can hear of a favorable opportunity by addressing GAMB, this office.—[Ad]

SOUTH-EAST TEXAS—FORESTS, PRAIRIE, GAME AND MINERAL WATERS—A TERRA INCOGNITA.

HOUSTON, March 16, 1878.

EDITOR FOREST AND STREAM:

Having just returned from a trip of some ten days in Southeast Texas, I offer some notes on the country and people. I took the Texas and New Orleans Railroad at Houston and rode through to Orange, on the Sabine, 106 miles east of my starting point. Though on a railroad, it is a *terra incognita*. It is indeed a wilderness, with a village here and there at wide distances, and an exceedingly sparse population between. Though I have lived in Texas twenty years, and twelve of these in Houston, I had little idea of such a wilderness at my doors. It is alternate forest and prairie, pierced by great rivers and numerous creeks and bayous. The country is almost a dead level. Away from the streams, the forests are principally the long-leaf pine, straight as the masts of a ship, and yielding from two to three saw-logs to a tree. This long-leaf pine is the best pine in the world. It differs from the short-leaf as a full-blooded horse does from a "scrub." It is nearly all heart—great-hearted, like all great men or things. Of late it has been discovered to be a very fine material for railroad ties; our oak lasts about three and a half years, while the long-leaf pine tie is good for ten to fifteen years. Indeed, it seems to me that it is almost impossible for it to decay, so heavily is it charged with its fat resin. The Texas railroads are now excluding oak and taking to the long-leaf pine. Southeast Texas is a world of this pine. Here is work for thousands of saw-mills.

In the wide valleys of the streams the forests are white oak, gums of various sorts, gigantic cypresses, boltus, beech, birch, myrtles, wild peach and magnolias. The railroad passes through a forest of magnolias, on the Trinity. It is fifteen to twenty miles in length and two to three in width. This makes a lumber as beautiful as satin-wood, and much more compact and heavy. The wild peach attains fifty to sixty feet in height. It is a very solid and fine-grained wood. These are only some of the forest trees. There are a great many other sorts too numerous to mention.

THE SOIL.

On the prairies it is a dark, sandy loam, in its timbered valleys it is alluvial, and rankly deeply rich. The prairies cannot be made productive without drainage, and often this cannot be had without cutting extensive ditches. Perhaps from Houston to Orange there are not a dozen farms on the prairies. Even along the streams they are few and far between. Here is a country capable of supporting and enriching millions, and yet how few to enjoy it!

THE BOTTOMLESS LAKE.

Near the San Jacinto, a circular lake of an acre or two, was pointed out to me by an old citizen, who assured me that it had no bottom—at least, that no human being had ever been able to find it, though sounded with several hundred feet of line. It is clear as crystal, and as we passed I saw the fishes splashing upon its surface. Is this a volcanic fissure? I inquired of many about this lake afterwards, and all said it was bottomless. It has no stream flowing in or out.

GAME.

The whole country is alive with it—the prairies, with grouse, plover, snipes, curlews, ducks and geese; its forests, with squirrels, possums, coons, wild cat, catamounts that have no tails, wolves, bears and panthers. Turkeys and deer are everywhere. A sportsman could glut himself almost anywhere along this road in a short time. Do not think that I am exaggerating; it heats any country for game that I ever saw. "Gators are abundant even on the prairies in wet weather. If some of you New York sportsmen will come out next fall or winter I will insure you such sport as you never dreamed of. The "roughness" you will have to put up with will make it all the more enjoyable.

ORANGE.

This is the terminus of the Texas and N. O. RR., the Texas people having built it to the Louisiana line, and the Louisianians people having done nothing to build it to New Orleans, as they promised. Had too much confounded politician Louisiana. Orange has about 2,000 people. It is the great lumbering mart of Texas. It ships daily several hundred thousand feet of lumber, and as many shingles, besides railroad ties. The logs are floated down the Sabine River in rafts. This river is a big stream. At Orange it is from thirty to eighty feet in depth. Were it not for the bar at its mouth, and a few miles in Sabine Lake, through which it passes, the Great Eastern could ride to Orange, and that place would be not only the great lumbering mart of Texas, but also one of the greatest in the world.

The people here are intelligent, bright and active. Many of them are Michiganders and Pennsylvanians, who have come to embark in the lumber business. I talked with a number of them, and they were all pleased. The Michiganders say there is no such lumber region in Michigan as this.

There is no agriculture about Orange—none whatever. There are a few country people, but they depend on cattle and logs. Orange gets all her vegetables from Houston, and nearly everything else that she eats. The people pray for an influx of farmers. It is a grand rice country, but good drainage would generally be required for any other crop. The orange flourishes, and there is hardly a yard that is not stocked with bearing trees.

BEAUMONT.

This town is twenty-four miles west of Orange, on the Neches. Next to Orange, it is the great lumber mart of Texas. Its exit to market is by the railroad and by vessels down the Neches, to the Gulf. It has about 1,200 people, nearly all engaged in the lumber business. Here, also, are a number of Michiganders. Southeast Texas looks like it was going to become a new Michigan. Everybody seems prosperous, and there does not appear to be any "contraction" here. The lower half of the country of which Beaumont is the capital, is a great prairie extending to the Gulf, which is filled with cattle and horses. The stockmen are nearly all rich, many branding from 1,000 to 3,000 calves a year. They are mostly of French extraction, very hospitable and pleasant, dress well for stockmen and would be good readers if they did not live so remote from anything to read. They live at wide distances on the prairie. The grass on the prairie is rank but coarse,

and I do not consider it half as good a stock country as beyond the Colorado. Still the woods, even in winter, are filled with succulent vegetation. In winter they stay in the woods unless driven out by high water, and in summer they take to the prairies, where the musquitto and the gallinipper flourish not. You don't know what a gallinipper is, I reckon. He is the great grand-daddy of all musquittoes. They say he is sometimes as big as a humming-bird; and when he bites—he bites! I have occasionally been attacked by a swarm of them. I tell you they make a fellow fight and run. Their domicile is marshes and low forests. There is very little agriculture in the country, so little that even Beaumont gets its vegetables from Houston. Yet it is a good agricultural country.

Four or five miles south of the town in a prairie is a cluster of mineral wells, within a few feet of each other. They are five or six feet deep, the water nearly reaching the surface, but never overflowing. The principal one is nearly of the color of milk, and is in a constant state of tumultuous ebullition, which is not water boiling up, but currents of gas escaping from below. This water is so sour that it sets the teeth on edge. It emits a strong sulphurous odor. The other wells have water of the same sort, only varying in strength. Gas issues from the ground all about them, and one can get a gas-light any time by inserting a hollow reed in the ground and applying a lighted match. There are no houses here—nothing but a great prairie. The people say that the water will cure the worst cases of dyspepsia and dropsy in a short time. Some enterprising man will some day make his fortune here.

SOUR LAKE.

Sixteen miles west of Beaumont is Sour Lake Station. I left the railroad here and rode eight miles north to Sour Lake. I think this is the most remarkable place in the world. The lake is a pond of about two acres of clear water, and on and near its edges are twenty-six wells, nearly all differing in character. All are in a state of ebullition or agitation from escaping gas. The lake is also filled with bursting bubbles. Some of these wells are precisely like the sour wells of Beaumont. Some act as a cathartic in a few minutes, and others in as short a time act powerfully on the kidneys. Some are covered with crude petroleum, or a substance very like it, and these have a very strong taste of tar. There is one fine spring of chalybeate. The bottom of the lake is hard asphaltum. It is destitute of life as far as I could see, except a very minute, red, wriggling worm.

I stopped at the place two days, and saw numerous gas-lights made by applying matches to the gas jets issuing from the ground. Near the lake is a bed of hard asphalt like that in Trinidad, only it is not so pure, at least on the surface. I should think petroleum would be obtained here in great quantity. It was attempted some time ago. The shaft had been sunk about 40 feet, when the fellow concluded he would apply a match to the hole. A great explosion instantly followed, knocking the man senseless, but not killing him. He then gave up the job. Some scientific man ought to visit the place and let us know what it is.

A BEAR THAT KILLS TWO MEN AND A DOG.

A day or two before I arrived at the lake and old Indian, John Scott, chief of the Coushattas, who lives in that region, and his grandson were killed by a bear a mile or two off. The bear was gobbling up a favorite dog of theirs, and the young man rushed up to help the dog. Bruin, having slain the latter, turned upon the young man, seized him in his arms, hurled him to the ground and fatally wounded him by biting him in the small of the back. The old man came up at this juncture and rushed upon Bruin with his knife. The bear rose upon his hind-legs, clasped the old chief to his bosom, took his head in his mouth and crushed it like an egg-shell. A white man came up just then and killed him. Who will say after this that a Texas bear is not a good fighter?

HEALTH.

The people look as hearty as any I ever saw. Drink easter water and do not live in the heavily timbered valleys, and all is right. The eternal breezes from the Gulf keep the air pure.

Houston, Texas, March 12, 1878.

FORESTS, BIRDS, INSECTS, CROPS.—The testimony of Dr. Testelin, before the French Senate in the discussion of a bill for the protection of small birds, showed that in certain portions of France the annual crops were half destroyed by worms. These sections are those deprived of trees, like the Beauce, and hence deserted by small birds. On the other hand, the finely-wooded Bocage has plenty of birds, and the farmers do not complain of the ravages of insects. This is a new feature of the forestry question, which is now assuming importance in several European countries, and which in this country may yet engage the serious attention which our legislators are slow to give to it.

A FLOWER'S MISSION.—The following, from the Schenectady Union, may appear somewhat apocryphal, but we doubt not the ladies of the New York Flower Mission could tell many a marvelous story of the floral gifts their hands dispense:

"A growing flower was given to a sick girl. In trying to take care of it the family made changes in their way of living. First they cleaned a window that more light might come to its leaves; then they would open the window that fresh air might help the plant to grow. Next the clean window made the rest of the room look so untidy that they used to wash the floors and walls and arrange the furniture more neatly. This led the father of the family to mend a broken chair or two which kept him at home several evenings. After the work was done he stayed at home instead of spending his leisure hours at the tavern, and the money thus saved went to buy comforts for them all. As the home grew attractive the whole family loved it better than ever before and grew healthier and happier with their flowers. Thus the little plant brought a blessing."

—The quantity of food which a plant obtains from one and the same soil is in proportion to its absorbent root surface. Of two species of plants which require the same quantity, and a similar relation of mineral food, the one with double extent of root surface takes up double the quantity of food. Thus it is manifested that root-spreading plants are soil-feeders; that leaf-spreading plants are air-feeders; that is, they chiefly feed upon the air and soil respectively.

The Kennel.

TO CORRESPONDENTS.—Those desiring us to prescribe for their dogs will please take note of and describe the following points in each animal:

1. Age. 2. Food and medicine given. 3. Appearance of the eye; of the coat; of the tongue and lips. 4. Any changes in the appearance of the body, as bloating, drawing in of the flanks, etc. 5. Breathing, the number of respirations per minute, and whether labored or not. 6. Condition of the bowels and secretions of the kidneys, color, etc. 7. Appetite; regular, variable, etc. 8. Temperature of the body as indicated by the bulb of the thermometer when placed between the body and the foreleg. 9. Give position of kennel and surroundings, outlook, contiguity to other buildings, and the uses of the latter. Also give any peculiarities of temperament, movements, etc., that may be noticed, signs of suffering, etc.

FIXTURES FOR 1878—BENCH SHOWS.

Boston Kennel Club Show, Boston, Mass., March 26, 27, 28 and 29. Dr. E. J. Forster, Secretary.

Baltimore Kennel Club's Show, Baltimore, Md., April 23, 24, 25 and 26. L. R. Cassard, Secretary.

The Westminster Kennel Club (New York) Bench Show, Gilmore's Garden, May 16, 17, 18 and 19. Dr. W. Seward Webb Secretary.

MASSACHUSETTS KENNEL CLUB—THE BOSTON BENCH SHOW.

Boston, March 26, 1878.

THE building in Central Court is admirably adapted to the peculiar wants of a dog show. Fairly spacious as to rooms for the display of the dogs, three whole stories were used, and to each story had been partitioned off a separate enclosure away from the crowd, so that on all the stories dogs were judged at the same time. The advantage of judging dogs as soon as possible is quite manifest. A three or four days' show of the dogs by no means improves their condition, and then public curiosity must be satisfied as speedily as possible. Down stairs, then, were placed the champions of the bench shows with other sporting dogs; on the second story were found the surplus of sporting dogs, together with the spaniels, the cockers, the Irish water dogs, and the Chesapeake Bay dogs, and on the highest story—the third flight—were the mastiffs, the New Foundlands, the collies, helle terriers, the stag hounds, the Pomeranians, the pugs, skyes, toy dogs, with the fox hounds, with greyhounds. In this upper story, too, were grouped the sportsmen's guns, rods and vestments. Messrs. W. Read & Sons had a fine collection of Scott guns, and conspicuous was the Bogardus gun, with its two barrels, which had been in the 5,000 ball match. Mr. W. B. Schaefer made an exhibit of guns of his own make, which were faultless as to style and finish. The Messrs. Parker Brothers had a show case with a choice selection of their well known arms, while the hunting suits of Messrs. C. W. S. Simmons & Sons occupied a conspicuous position. This story was also ornamented with numerous pictures of dogs, fish and game, executed by the best artistic talent in the country.

The arrangement for the comfort of the dogs was excellent. The stalls were roomy and were filled with fresh straw, and ventilation was admirable. The boxes were arranged so that there was ample room for passage way, and there being three stories, with convenient stairs, though there was present during the first day (Tuesday) a very large attendance, there was no unnecessary crowding. Somehow or other dog shows are mostly held in dark buildings, so that it is hard to see. In Boston the light was excellent.

One thing which is worth while mentioning, is that pedigrees were not allowed to be put on kennels until after the dogs were judged. By eleven o'clock, everything being in excellent style, thanks to Mr. Lincoln, the superintendent, numbers on boxes corresponding for once with the dogs as printed on the catalogues, judging commenced. The judges were Mr. John Davidson, for the setters and pointers; Dr. L. H. Twaddell, for the fox terriers, spaniels, Chesapeake Bay dogs, hounds and part of non-sporting dogs, and Mr. T. H. Scott for classes 30 to 43 (bull dogs, bull terriers, and pet and non-sporting dogs).

Certainly the excitement commenced at once in a bench show when the cracks, the champions, are pitted against one another. Here there were four first rate ones entered, though Drake, Mr. Luther Adams' fine white and black, did not compete, as Mr. Adams is a member of the club. Mr. Carleton's Dash, with Mr. P. H. Morris' Lark and Czar, and Mr. Bryson's immensely fine Gladstone, now had it out for the blue ribbon. The ex-premier, as good on the bench as when he won the puppy stakes in Nashville, was in fine form, and Gladstone took the prize, Lark coming in for a very high commendation, and Dash and Czar for highly commended. It was a long and careful deliberation on the part of the judge, and the awards were given after no end of examination. The champion English setter bitches now came on trial. Mr. Charles' Rose, a handsome white and black ticked animal, was adjudged the first, the same owner getting a v. h. c. for Nina, with Mr. L. H. Smith's Clip.

Now came an exciting event—the judging of the champion Irish setter dog. Here there were two dogs. No. 12 was Berkley, the pride of the St. Louis Kennel Club, with Dr. Jarvis' Elcho. These dogs had it out in St. Louis, when Elcho got the blue. Both dogs were in good order, but Berkley is just a little the fresher and truer to form, and there never was a more delicate point raised than between the excellence of the two. It may be said, to Mr. Davidson's credit, that he reversed his decision in St. Louis, as Berkley was a shade better in condition, and the St. Louis Kennel Club has now the right to sport the blue. In champion Irish setter bitches there

were three dogs shown to the judges—Biddy, Fanny and Moya. Again West had the best on the East, and the handsome Biddy, of the St. Louis Kennel, took the first prize. Now came on the Gordons, with four champion dogs. For the prizes in class 3 there were four good ones, to wit: Kent, Dinks, Grouse and Rupert. Here was another very close thing. There was no end of comparing of pointers here. At last Mr. W. J. Farmer, with Rupert, a 4½ year old, real black and tan, without a false color on him, and true to make, got the first prize, his three competitors coming off each with a very high commendation. The Gordon bitches, being next in order, showed up some three. Here was a mate bitch to Mr. Farmer's Rupert, if anything, better than the dog. The judge saw the same strain in Fan, belonging also to Mr. Farmer, so that this gentleman carried off for dog and bitch first prizes. Mr. Tileston's Lou had a V. H. C., and Dr. Wright's Gipsy a H. C. We may remark that in future we shall look to Toledo for a fine race of true Gordons, for it is there that Rupert and Fan belong. Now came the sensation in many senses of the term—class 4, champion pointer dogs. Eight dogs passed under the judge's eye. Here were some mighty good ones. Fosco, belonging to Mr. Shelton, of Auburndale, though a good one, was not as fine as either Mr. Orgill's Flake or Rush. Mr. Sterling's Sleaford had most things in his favor, but they all paled before Sensation, and to Sensation the first prize was properly given, though Mr. Orgill got two of the three syllables awarded, as did Mr. Strong's Pete.

Such a pretty string of pointer bitches we rarely saw. Of five shown, Mr. Edmund Orgill's Rose, a beauty in lemon and white, with the daintiest of make and form, thoroughbred all the way through, took the prize. Never was an award better made. Of the merits of Buff and Gipsy, we may state that they had many points in their favor, but, if anything, we should have given Buff the second place, relegating Gipsy and Kit to an H. C. only.

Class 5 was that of imported English setter dogs. Here was a big lot of dogs. Some good, some middling, and quite a number down right poor. You can buy no end of dogs in England, but there are as many poor ones there (for the money) as any where else. Lelaps, the winner, however, a black, white and tan, deserved fully the blue, as did Mr. T. H. Scott's Pound a second prize. Of imported English setter bitches, Diana, owned by Mr. F. Sumner, was a good winner. Quite a likely lot were class 5, composed of imported English setter dog puppies. Mr. L. H. Smith's Temple Bar, a lemon Belton of 8 months, deserved the first prize. Of the bitch set-puppies imported, Mr. L. H. Smith, of Strathroy, was again the victor with a pretty dog, Lass o' Lowrie. If an offspring of Paris and Pearl is not handsome, we wonder what could be.

Now came perhaps the most important event of the first day—the judging of the Native English Setter Dogs. In this class the No. 6 were the real working dogs. Now, this series of dogs must show, at least as far as appearances go, what we have been working for for so many years. Of course, as has been said over and over again, it is not the handsomest dog which is always the best performer, but, as in animals, it is perfection of physical form which brings out their best physical qualities. If we breed from handsome, well made, properly proportioned stock we ought to get animals with good noses and fine limbs. It may be taken as certain that, through many years of careful selection, the instincts of the dog have kept abreast with his finer make or build. Now, in this Class 6 there were no end of prime animals. It was a pick among fifty odd dogs. The judging room, spacious enough, was crowded with fine dogs. No easy task was it to discriminate among so many. It took most an hour and a half for the judge to decide. When the award of the first prize was given to the No. 80, Mr. G. A. Thayer's Dan'l Webster, there was almost applause in the room. Dan'l Webster is as noble a dog as there is in the show. He is white, with a little red, as handsome as can be, and is a superb performer in the field. The dog has in him the blood of a Rake and Rachel—the great expounder's own dogs. We take pleasure in recording this fact—that, amid so many competitors, many of them first-class dogs, the award caused no jealousies. Mr. D. V. Waters' Grouse had the red ribbon, the second prize. This, too, was a very just award. Grouse is a prime animal, and a fitting second to Webster. In this class the V. H. C.'s and H. C.'s were liberally distributed, to the amount of twenty-eight. Again, we must impress upon our readers the great excellence of this lot of dogs, which alone would have made the Boston Bench Show attractive. It is worth while stating that nine-tenths of these dogs are from New England States.

Want of space prevents our giving further details of the show on the first day. We can only add the following dogs as winners in the various classes:

Class 13—Chesapeake Bay Dogs—First prize, 407, Baltimore Kennel Club, Baltimore, Md., Rob, sedge, 6 years; brother to Dr. Keenor's Rose. Second prize, 405, C. P. Keeler, Cambridge, Mass., Rufus, brown, 14 mos; Hammond stock by Borland's Tray—Hammond's Ruby; full pedigree.

Bitches—First prize, 408, Gard G. Hammond, New London, Conn., Rose, sedge, 5 yrs; Rabb—Ruby. Second prize, 409, same owner, Ruby, sedge, 2 yrs; Rabb—Rose. V. H. C., 410, same owner, Ruby, sedge, puppy.

Class 14—Irish Water Spaniels, Dogs or Bitches—First prize, 413, J. H. Whitman, Chicago, Ill., King of the River, liver, 2½ yrs; Mike—Liffey. Second prize, 414, same owner, Liffey, liver, 3½ yrs; Doctor—Bridget.

Class 15—Cocker Spaniels, Dogs or Bitches—First prize, 427, Lawrence V. Pool, Beverly, Mass., Roney, lemon and white, 3 yrs; from imported stock. Second prize, 429, Fred Seaver, Jamaica Plain, Mass., Fannie, orange and white, 11 yrs; Hart's Shot—Fan.

Class 16—Cocker Spaniels, Dogs or Bitches—First prize, 433, E. W. Davis, Providence, R. I., Fanchon II, liver and white, 3 yrs; imported; also in Class U. V. H. C. 434, Lemuel Willey, Baltimore, Md., Queen, black, 7 yrs; imported.

Class 17—Field Spaniels, Dogs or Bitches—First prize, 446, Charles McCrossin, Boston, Fido, white and liver, 3 yrs. Second prize, 444, L. C. Massey, Boston, Dan, black, white and liver, 3 yrs; imported.

In judging of the foxhounds, Dr. Twaddell very properly took into consideration the kind of dog wanted in the New England States for fox-hunting. Now, if speedy, well drawn dogs, such as are used in Pennsylvania or Maryland, were put on the trail of a fox in New Hampshire, with the rocks and stones that abound there, the dogs could not follow Reynard. A fast dog is not what is wanted. Types and standards, then, of foxhounds in the United States must be varied. In New England the dog is not expected to kill the fox, it is the man who does it. To eyes somewhat accustomed to English or Southern foxhounds, the New England dog would appear strange. But, for stony New England, where foxes are followed on the snow and vulpecide is not a sin, just such dogs as were shown at Boston are the best; and quite wisely, with a full understanding of the case, Dr. Twaddell's judgments were given.

Class 18—Foxhounds, in couples—First prize, 452, Charles Brown, North Somerville, Mass., Bagler and Piper, pied, 2½ yrs, and 4 yrs 9 mos. Second prize, 453, L. P. Bartlett, Arlington, Mass., Lion and Jack, yellow and white and black and white; also in Class N. V. H. C. 453, H. W. Jordan, Boston, Fan and Sam, black and tan, 6 yrs. H. C. 454, L. P. Bartlett, Arlington, Mass., Hunter and Fannie, black, mottled and white; also in Class N.

Class 30—Bull Dogs, Dogs or Bitches—First prize, 552, Geo. G. Haven, New York, Duke, white and brindle, 8 yrs; full pedigree. Second prize, 549, Al Watts, Boston, Billy, white and mottled, 2 yrs; imported from England.

Class 31—Bull Terriers, Dogs or Bitches—First prize, 574, James G. Lathrop, Boston, Steel, brindle, 20 mos; by Duffy's dog. Second prize, 568, Jerome F. Hale, Boston, Daisy, white, 8 yrs; Brown's Ben—Flood's Nellie. V. H. C. 559, Thatcher Goddard, Boston, Topsy, brindle and white, 3 yrs 7 mos; full pedigree. H. C. 567, Matthew Gay, Boston, Nell, brindle, 2 yrs; with 7 pups.

Class 39—First prize, 581, Miss Chickering, Boston, Punch, fawn, 4 yrs; Champion—Lena; full pedigree; also in Class Q. Second prize, 580, H. L. Daggett, Boston, Dandy, fawn, 3 yrs. V. H. C. Miss Mary D. Wagstaff, Babylon, L. I., Sambo, fawn, 4½ yrs; by imported Tobv out of Topsy, winner of second extra at New York. H. C. 578, A. H. Stebbins, Boston, Donna, 8 mos; Colburn's Polo—imported Countess; full pedigree.

Class 34—First prize, 595, N. Gunning, Boston, Ida, black and tan, 4½ yrs. Second prize, 591, William Vanson, Boston, Pinky, black and tan, 10 mos; from imported stock. V. H. C. 598, James A. Bowtell, Providence, R. I., Pinkum, black and tan, 1 yr; full pedigree.

Class 35—Skye Terriers, Dogs or Bitches—First prize, 607, George M. Gale, Boston, Flossie, blue, 3 yrs 4 mos.

Class 38—Yorkshire Terriers, Dogs or Bitches—First prize, 634, Henry Kieterman, New York, Beauty, blue and tan, 16 mos; full pedigree. Second prize, 631, same owner, Bright, blue and tan, 1½ yrs; full pedigree. V. H. C. 632, same owner, Charley, blue and tan, 1½ yrs; full pedigree; 633, same owner, Dandy, blue and tan, 1½ yrs; full pedigree.

Class 39—Toy Terriers (not exceeding 5 lbs weight) Dogs or Bitches—First prize (divided), 636, W. O. Cross, Boston, Flossie, blue and tan, 3 yrs 8 mos; 638, Henry Kieterman, New York, Dandy, silver, 16 mos; full pedigree.

Class 40—Blenheim, King Charles or Japanese Spaniels, Dogs or Bitches—First prize, 642, S. K. Hindley, Worcester, Mass., Charlie, black and tan, 2 yrs 9 mos; Bertie—Garwood's Fannie. Second prize, 641, same owner, Lady, black and tan, 2 yrs 9 mos; Garwood's Hylus—his Daisy.

The Boston Bench Show has not a single drawback. All classes of dogs were very fully represented, and the management of the whole business as perfect as possible, reflecting great credit on the officers of the Massachusetts Kennel Club.

ENTRIES OF THE FIRST ANNUAL EXHIBITION OF THE MASSACHUSETTS KENNEL CLUB BENCH SHOW OF DOGS, HELD AT CENTRAL COURT, BOSTON, MASS., MARCH 25, 27, 28 AND 29, 1878.

The following are the numbers of entries in each class of the Boston Bench Show.

DIVISION FIRST.—SPORTING DOGS.	
Champion English Setter Dogs.....	5
Champion English Setter Bitches.....	6
Champion Irish Setter Dogs.....	2
Champion Irish Setter Bitches.....	4
Champion Gordon Setter Dogs.....	5
Champion Gordon Setter Bitches.....	4
Champion Pointer Dogs.....	10
Champion Pointer Bitches.....	5

ENGLISH SETTERS.	
Imported English Setter Dogs.....	16
Imported English Setter Bitches.....	6
Imported English Setter Dog Puppies.....	4
Imported English Setter Bitch Puppies.....	5
Native English Setter Dogs.....	55
Native English Setter Bitches.....	25
Native English Setter Dog Puppies.....	16
Native English Setter Bitch Puppies.....	5

IRISH SETTERS.	
Imported Irish Setter Dogs.....	25
Imported Irish Setter Bitches.....	9
Imported Irish Setter Dog Puppies.....	5
Imported Irish Setter Bitch Puppies.....	5
Native Irish Setter Dogs.....	10
Native Irish Setter Bitches.....	8
Native Irish Setter Dog Puppies.....	8
Native Irish Setter Bitch Puppies.....	3

GORDON SETTERS.	
Gordon Setter Dogs.....	21
Gordon Setter Bitches.....	9
Gordon Setter Dog Puppies.....	9
Gordon Setter Bitch Puppies.....	5

POINTERS.	
Pointer Dogs.....	35
Pointer Bitches.....	9
Pointer Dogs, under 50 lbs weight.....	13
Pointer Bitches, do.....	12
Pointer Dog Puppies.....	16
Pointer Bitch Puppies.....	14
Chesapeake Bay Dogs.....	3
Chesapeake Bay Bitches.....	4

IRISH WATER SPANIELS.	
Irish Water Spaniels.....	15
Chamber Spaniels.....	5
Cocker Spaniels.....	12
Field Spaniels.....	8
Fox Hounds.....	9
Beagles.....	4
Dachshunds.....	3
Fox Terriers.....	9
Greyhounds.....	5
Scottish Deer Hounds.....	5

DIVISION TWO.—NON-SPORTING DOGS.	
Mastiffs.....	21
St. Bernards.....	15
Newfoundlands.....	7

Siberian, or Ulm Dogs.....	3
Dalmatians, or Coach Dogs.....	3
Shepherd Dogs, or Collies.....	7
Shepherd Dogs, or Collies.....	5
Bull Dogs.....	6
Bull Terriers.....	23
Pugs.....	12
Black and Tan Terriers, exceeding 11 lbs weight.....	2
Black and Tan Terriers, not exceeding 11 lbs weight.....	13
Skye Terriers.....	14
Scottish Terriers.....	7
Dandie Dinmont Terriers.....	3
Yorkshire Terriers.....	8
Toy Terriers.....	9
Blenheim, King Charles, or Japanese Spaniels.....	5
Italian Greyhounds.....	5
Poodles.....	8
Miscellaneous.....	12
Trick Dogs.....	5

DIVISION THREE.—SPECIAL CLASSES.	
Best Kennel English Setters.....	3
Best Kennel Irish Setters.....	2
Best Kennel Gordon Setters.....	2
Best Kennel Pointers.....	5
Best Kennel Water Spaniels.....	3
Best English Setter Stud Dogs.....	2

Best Brace of Beagles.....	1
Best Pointer of Any Weight.....	21
Best Native Setter Puppy of Any Strain.....	1
Best Skye Terrier.....	3
Best Blenheim or King Charles Spaniel.....	1

FOX HUNTING IN TENNESSEE.

NASHVILLE, TENN., Feb. 23, 1878.

EDITOR FOREST AND STREAM:

Fox hunting is a favorite sport of the gentry in this State, and, although their packs of hounds and their horses are not so good nor well kept as before the war, still the love of the sport is so great that it makes up for the disadvantages. Last week quite a grand chase came off. Twenty-five or thirty couples of pretty fair hounds were gotten together, and a large number of gentlemen and some few ladies turned out to follow them. Soon after meeting a fine red fox was unearthed, the dogs let on, and away they went at a break-neck speed over a beautiful country after him. Unfortunately, after a run of two or three miles, rain began to come down in torrents, which had such a dampening effect upon the huntsmen and so demoralized the hounds that Reynard was enabled to get away from them. Under more auspicious circumstances, however, it is no uncommon thing to kill two or three foxes in a morning's hunt. Near the Hermitage, the old homestead of Andrew Jackson, a great many foxes are to be found, and good dogs to chase them.

The trout (bass) fishing has fairly begun. The rivers and creeks have become clearer since the fine, bright weather set in, although it is still quite cool. Some fine fish have already been taken. Col. G. F. Akers, a noted angler of this city, showed me, a few days ago, some beautiful specimens of bass caught in Buffalo, a stream in Humphreys County, the largest scaling five pounds. They were caught with minnow bait. The fish, as yet, lie very deep and in sluggish water. A large quantity of fish is brought to this market from the Northwestern lakes and Pensacola. In passing some of our fishmonger's stalls a stranger would scarcely believe himself more than five hundred miles away from the natural elements of the salmon, lake trout, shad red snapper and the pompano. They are brought here in refrigerated cars and are as fresh and in as good condition as when caught. J. D. II.

SHOOTING FOXES IN NEW HAMPSHIRE.—The above heading may be objectionable to some of the readers of the FOREST AND STREAM, particularly to those living in the Southern States, many of whom deem it most unpardonable and unsportsmanlike to shoot a fox. Any one, however, who is familiar with the rough nature of the country in New Hampshire will acknowledge that the only successful methods of destroying them are by trapping and shooting, and considering the damage they do to both game and poultry, it is conceded that any means (except poisoning) are justifiable by which their numbers may be diminished.

I have had no experience in trapping foxes, but have shot about fifty during the last four years, only hunting them during the winter months, when there has been from one to three feet of snow on the ground, and no other shooting to be had; consequently I have learned something of their habits when followed by a dog.

The man who shoots the largest number of foxes is he who has the most patience. A neighbor of mine, who kills about twenty-five every winter, starts early in the morning, and as soon as the dogs strike a track, places himself at some particular point where, from former experience, he thinks the fox will cross, and there he remains until dark, unless he gets a shot before that time. I have stood in a corner of a certain pasture and killed three at different times. One cold, windy afternoon I started out, when the thermometer stood within one or two degrees of zero, near the above locality, and after waiting three hours was rewarded by getting the fox, although it was so cold that I could hardly handle my gun. Very often when hunting foxes among second-growth timber or in a white birch swamp, where they are frequently started, it is well to follow after the dogs as closely as possible, until the fox is started, as they often run once or twice through the cover in which they are found. By so doing I have killed as many, if not more, than by waiting at a particular point, often getting a shot in less than five minutes from the time they were started.

The dog which seems to be best adapted to this purpose is a small black and tan hound, weighing from thirty to thirty-five pounds. I have never found of what particular breed they are, but know that they do their work well. There are several of these dogs in my neighborhood, and nearly all

of them are slow moving, have hard feet and good, clear voices. The great advantage, however, is their size, as generally, when a fox is first started, he waits until he sees the dog which is after him, and they do not seem to much fear these little fellows.

I have owned one of these dogs for six years, and although he is in his thirteenth year, during the past winter he followed as well and nearly as long as when I first got him. If an estimate of the number of red foxes killed every year in New Hampshire could be made, the average would amount to a good many hundreds, as within a radius of six or seven miles of my home from fifty to one hundred are killed every year, and within that distance there are not more than eight or ten men who keep hounds. I have been told by a fur dealer in Concord, New Hampshire, that one year he bought over 700 fox skins, nearly all of them having been killed in the northern portion of the State.

C. M. S.

Dunbarton, N. H., March 13, 1878.

THE PORTRAIT OF PARIS.—Our editorial rooms have been graced with many fine portraits of distinguished dogs, but we give a most prominent place to a picture of Mr. L. H. Smith's famous blue belton, Paris, painted by Mr. Pranshuikoff. This artist, whose work frequently illustrates the pages of the Messrs. Harper's publications, made most of the drawings of the dogs in the New York Bench Show, which appeared in *Harper's Weekly* last year. The portrait of Paris is a superb picture in every way, and follows closely all the fine bred peculiarities of this choice animal. That small, fine and narrow head, full of thought, which distinguishes the Llewellyn stock, is admirably portrayed. The texture of the hair, the long feather, even the peculiar fleckings are brought out. It is a work in which not only the form is complete, but the silky covering of the animal has been carefully worked out. Sportsmen are very hypercritical as to the painted semblances of their favorites. The slightest divergencies of shape or marking bring forth unfavorable comments, which are, perhaps, rather of a practical than artistic character. Mr. Pranshuikoff's picture seems to have given the most complete satisfaction, and we are inclined to think that the portrait of Paris, as exhibited in our office, will be the means of extending numerous orders to this most clever artist.

TO OUR FRIENDS WANTING TO PURCHASE DOGS IN ENGLAND.—We would call particular attention to the fact that our well-known correspondent, Captain John M. Taylor, of Bellefonte, Nottoway County, Va., will leave shortly for England and the Continent, and is prepared to purchase, while abroad, any variety of dog which may be wanted. Captain Taylor's thorough acquaintance with dogs is too well known to be commented upon, as some of the finest breeds of dogs in the United States have been procured from England through his instrumentality. We take great pleasure in endorsing Captain Taylor, believing that all purchases of dogs, etc., made by him will be executed with the utmost judgment and in good faith. All letters addressed to Captain Taylor may be sent to this office, as he will be in New York toward the close of the month.

ELK RIDGE FOX-HUNTING CLUB.—This newly organized club of Baltimore held its first meet at Furnace Creek, five miles from that city, Saturday, March 16, and after an exciting chase captured a brush. The party numbered thirty.

JACK SNIPER.

COURSING AT DENVER.—Those interested in canine matters, in Denver, Col., are talking of organizing a coursing club in that city. At the first race the other day the contest was between O. Forrest's "Nelson" and P. Hart's "Fly." The game a jack-rabbit, and the prize \$100. Fly made seven points to Nelson's four, and thus won the match.

[Apres—What became of the jack rabbit?]

TEACHING DOGS TRICKS.—Baltimore, Md.—In your Answers to Correspondents you state that "you do not know what it costs to teach dogs to play tricks." I can tell you what it cost me. I have an orange and white setter, and to amuse my children (among them the retrieving baby sketched some time since in your columns), I trained him to shut the door. Unfortunately, he discovered that jumping against the other side of a door would open it. He jumped against the yard gate, succeeded in getting out, and it cost me five dollars reward, besides advertising, two dollars; new collar, one dollar; and new gate to shut when jumped against, three dollars—total, eleven dollars, not to mention tribulations and anguish of suspense during the three days that the dog was gone.

E. S.

DOGS POISONED BY STICHOENINE.—E. T. Whitmore, of Putnam, Conn., says: "I saved a valuable pointer dog that had eaten a moderate dose of the poison, and had it down until his jaws were set, and had hard convulsions, by injecting morphine into his hind quarters. The quantity injected was nearly two grains, at different times. It will save them when too late to do anything else for them."

NATIONAL AMERICAN KENNEL CLUB.—By virtue of authority conferred by Article 5 of the constitution and by-laws, I hereby call a special meeting of said club at New York, May 13 next, at 12 M. The secretary will give the members the requisite notice of objects of meeting. Notice of the place of meeting will be given hereafter and be posted in the Hippodrome during bench show of Westminster Kennel Club.

E. H. LATIMER, Pres't N. A. K. C.

Springfield, Mass., March 20, 1878.

—Mr. T. Tunstead's fawn and white greyhound bitch Winemucca has been sent to Mr. C. Dixon, of Whitehaven, England, to try conclusions with the greyhounds of that country. There are a great many fine greyhounds in California, many of which entered for a coursing meeting, which took place at Merced, March 20.

FIRST-CLASS IRISH STOCK.—Mr. J. K. Millner, of rifle fame, informs us that his red setter Aileen, who won the Centennial prize, has raised a fine litter of puppies. The sir

is Rattle, a grand dog, by Beau, out of Venus, being a brother of Bruno, the No. 6,178 of the Kennel Club stud book. Mr. Millner's address is Cherbury, Blackrock, Dublin.

NAMES CLAIMED.—Mr. W. H. Bernard, of Wilmington, N. C., March 19, 1878, claims the name "Duke of Gordon" for his black-and-tan pup, out of E. P. Welsh's Kate, by Alex. McConas' Mack.

—Mr. O. Totten, of Pains, Ontario, claims the name of Huntress for his orange and white setter bitch pup, out of Mr. B. Capron's Blanche by Bute, he by Carlowitz—Rose, she by Rufus—Rose. This pup is own sister to Princess, claimed in last issue.

—Solon W. Paul, St. Louis, Mo., claims the name of Zete for his red Irish setter bitch pup, out of John W. Munson's Kate by Sting II., litter brother to Loo II.

SALES.—Mr. H. B. Vondersmith, of Lancaster, has sold his Gordon bitch, Jennie, and his red Irish setter pups out of Biddie.

PURCHASE.—Mr. H. B. Vondersmith has purchased of Mr. L. H. Smith, of Stratford, his Laverick bitch Viatrix, the full sister of Countess. Viatrix will whelp, having been served by Lincoln, about March 22.

WHELPS.—B. A. Shapley's, Utica, N. Y., field-trial setter Bess—Bergundthal's Rake-Fanny—whelped on the 16th eight, five dogs and three bitches, by Burges' champion Roh Roy.

—Leta, belonging to Mr. W. Vic, of St. Louis, has whelped with seven puppies by G. N. Champion's dog France. Leta won first premium at Syracuse in 1877.

VISITS.—Dr. E. L. Tindeau's prize Dschbund bitch, Mein Gretchen, has visited Mr. T. B. Allen's Duke. These two dogs are as well-bred dogs as can be found in this country, and the pups should be fine.

Detroit, Mich.—S. F. Whitman's blue belton Nell visited Burges' Druid on the 19th inst. Druid, with Queen Mab, won first prize in brace stakes at late St. Louis, for being best brace of imported English setters in the show, beating Leicester and Paris, was V. H. C. in champion class, and 2d in open class, he was also a field trial winner in England.

Game Bag and Gun.

GAME IN SEASON IN MARCH.

Hares, brown and gray. Wild duck, geese, brant, etc.

FOR FLORIDA.

Deer, Wild Turkey, Woodcock, Quail, Snipe, Ducks and Wild Fowl.

"Bay birds" generally, including various species of plover, sand piper, snipe, curlew, oyster-catcher, surf birds, phalaropes, avocets, etc., coming under the group *Limicola*, or Shore Birds.

NEW YORK—Buffalo, March 20.—The first snipe of the season was shot at Batavia, near Buffalo, by Mr. P. Tompkins, on March 15. Buffalo sportsmen return without success in their search after snipe. We noticed on the Niagara the arrival of wedge-tail, blue-bill, red-head and teal. The old-wives have been there since the middle of January in several flocks, estimated by many hundreds. Vegetation is much advanced, but the arrival of spring birds is but little ahead of the general time.

O.

Good Ground, L. I., March 23.—Under above date, Mr. Orville Wilcox writes that the new inlet is a success, and the duck-shooting at present good.

Greenwood Lake, March 25.—Game prospects are very favorable. Woodcock are plenty, and large numbers of quail have safely wintered.

GREENWOOD.

ADIRONDACK PANTHERS.—The party who have been with Mr. Marks, at the hatchery near the Fulton chain of lakes, have, during the past winter, killed five panthers. The first killed was a female and two cubs, which the guides had followed ten days before overtaking. As the panther is destructive to deer, the hunters are protecting their own interests by exterminating them.

WILD PIGEONS.—There were shipped from Sheffield Station, P. & E. R. R., 18th inst., 1,200 dead pigeons, making 40 bbls., and 3,000 live birds to New York. The pigeons are nesting in that vicinity, those which have been keeping in Forest County all winter having been reinforced by Western flights, and they now number millions. Netters are after them also by the hundreds from all the surrounding States, some having followed the birds from Missouri.

A. F. C.

"Nick" writes: "The pigeons have left Sullivan and Bradford counties. Are now in Warren counties. To find them take P. and E. R. R. to Sheffield, between Kane and Warren. Roost fifteen miles distant."

—Reported in considerable numbers about Kingston, N. Y.

WASHINGTON, D. C., March 15, 1878.

Although it is but the Ides of March, we are having the most delightful spring weather, and the migratory birds have already made their appearance on their journey to more Northern latitudes. A few jacksnipe have been killed, and if this favorable weather continues, they will be abundant in a week or two. The best sport we have now is on the Potomac, where the duck-shooting is good and everything favorable for the enjoyment thereof, though the ducks are not so plentiful as they were in former years. The constant warfare made upon them, and the big guns—about which I have already written—have caused the steady decrease, year after year, in the number of water-fowl frequenting this river.

I fear many readers of *FOREST AND STREAM* would think me guilty of exaggeration were I to mention instances where I have seen the surface of the water of the Potomac and its bordering creeks covered with ducks to the extent of many acres. Indeed, so plentiful were they that a thousand or more arising from portions of the flats on account of a sudden fright would throw a great shadow over the water as

they passed, and the whistling produced by their wings might be compared to a violent wind storm. The eastern branch of the Potomac, upon which the Washington Navy Yard is located, about half a mile from the junction of that river with the main stream, had extensive flats which, twenty years ago, I have seen literally black with ducks. Higher up the branch, about a mile above the Navy Yard, are the extensive marshes near Boring's Bridge, the famous resort for ortolan and reed birds in early autumn, which I have described in previous letters. These marshes were filled with marine plants and grasses, upon which the ducks fed, and, in their flights to and from the feeding-ground, hundreds were killed by sportsmen. Big guns were unknown upon the river then, and trapping the birds was never thought of. Many times have I seen a dozen or more sportsmen upon the old wooden bridge which spanned the Eastern branch, just above the Navy Yard, during the morning and evening flight of the ducks, when it was an easy matter to kill half a dozen or more in less than half an hour. The old bridge has long since rotted away, and been replaced by a substantial iron structure of improved pattern. Washington has grown to be a great city, and the banks of the river on both sides are now thickly settled; hence the ducks no longer cover the waters of the Eastern branch.

Those unaccustomed to shooting, who have, no doubt, so frequently read and heard of the abundance of water-fowl in this vicinity, may well inquire why more of them are not killed. When one comes to consider the remarkable keenness of sight and acuteness of hearing possessed by these birds, their rapidity of flight and expertness in diving, the protection afforded them by their thick covering, through which shot from an ordinary gun will not penetrate unless the sportsman is within sixty yards of the birds, it will be seen that it is not an easy matter to kill them. It takes an expert shot to drop them when flying, even though the birds are within fifty yards. Many ducks fly at the rate of more than sixty miles an hour, which is twice the speed attained by some other birds, and should one merely winged drop in the water, he will be very apt to save himself by diving and swimming off beneath the surface, for some species of ducks, like swan and geese, seem to have sufficient sagacity to keep beyond range of the sportsman's gun when on the water—swan especially will swim before a boat, but always keep a safe distance ahead, and it is not often that a sportsman, in such skiffs as we have, can overtake them or compel them to rise on wing.

R. F. B.

SOUTH CAROLINA—Charleston, March 23.—Very little hunting of any kind has been done in this section for the last three weeks, the warm weather having driven the ducks farther North. One or two small bags of partridges have been brought in. Hunters report birds scarce and wild. A crick shot in the upper portion of the county, about three weeks ago, brought home twenty-one turkeys in four mornings. This is good shooting, but fortunately there are very few such sportsmen in this section. Have been out after foxes three times within the last three weeks, but did not start one, although hitherto they have been quite plentiful in exactly the same country we hunted over. It is with considerable pleasure that I note the general observance of our game law, especially in regard to deer hunting.

Y.

TENNESSEE.—The Murfreesboro' *News* says: During the season just closed one firm in this place shipped 40,000 robins, 10,000 chickens, 5,000 geese and 10,000 dozens of eggs. The shipments were made to all parts of the United States.

ALABAMA—Mobile, March 15.—This is one of the best points in the South for a sportsman to spend a few weeks in pursuit of game and recreation. In winter from the first of November to the last of January the "flats" at head waters of our hayabout in all varieties of waterfowl, and splendid duck shooting can be had in from two to three miles of the city, and deer, turkey, quail and the brown bear can be found within a short distance of the city, by boat up the Alabama or Bigbee Rivers, or by the Alabama Grand Trunk R. R. or M. & M. R. R. Perhaps this may appear strange to you in having game so near and in such varieties and so little known to new visitors. Will give you the result of a half-day's shoot a few days since: Dr. T. S. S., B. H. G. and myself were out at 6 A. M. upon what are termed the "Plains" in the southern suburbs of the city, and at 1½ o'clock P. M. were at our homes, and upon examination of our Holabird & Thomson coats counted out forty-two Wilson snipe, one teal, one rail, and one rabbit, and this in the city limits, not once going out of them. What think you of this for a game point? We have a game law here for the protection of game, but in the absence of a club or two to see them enforced I fear that our game will not remain with us as it should. There is a club now organizing which I hope will be completed soon and prove all that we desire.

BLACK GEORGE.

MISSISSIPPI—Corinth, March 19.—Weather magnificent; warm and clear. No snipe; turkeys gobbling, but none gobbled up to date. Was out after quail a few days before the season closed, with three friends. It was awfully hot, and we did the poorest shooting on record. Bagged 35 quail. Shot enough to have killed 75.

GUYON.

MICHIGAN—Detroit, March 23.—W. Edwards, Marquette, Mich.; Wm. Hall, Toledo, Ohio, and E. H. Gillman, of this city, returned last evening from a two-day's duck hunt at Hall's ranch, near Rockwood. They had poor success, bagging only 108.

DRAID.

WISCONSIN—Menomonie, March 21.—Wild geese put in appearance on the Dunnville hunting grounds about March 14th, and ducks in small numbers about the 18th, but this morning they appeared more plentiful about Nine Mile Slough, and shooting will soon be fair. Wild pigeons came to-day.

MINNESOTA—Worthington.—The winter here has been a wonderfully open one, many of the farmers having been plowing during nearly every month. Ours is a great game region in the season, as your columns of old, and the editorial recollection now can testify. The wild fowl have put in an appearance—ducks and geese—and fishing has been going on in Okabena Lakes for several weeks. Several wolves have been seen near Capt. Heath's homestead in Elk Township. The mild and dry winter makes us hope for famous sport when the grouse come in season.

R. E. D.

KANSAS—Rosedale, March 17.—Ducks are scarce about here as yet; expect good sport when they come. At the last annual meeting of the Rosedale Game Protective Club, the following officers were elected for the ensuing year: J. H. White, Pres't; J. Sullivan, Vice-Pres't; Wm. Bowen, Sec'y; Benj. Rees, Treas.; T. D. James, Capt.

HAM.

CANADA, Montreal, March 25.—We shall begin our spring shooting as early as the end of March. The golden-eye, or whistler, have already made their appearance two weeks ago, and are now followed by the black duck and the Canada goose. A large number of these birds are bagged every year at the Lachine Rapids, which are only a short distance from Montreal. It was there our lamented friend "Royal" was taken with a cold, which, it is said, brought him to an untimely death. I recently called on Vital Barretto, who was "Royal's" guide in most of his shooting expeditions. I found him overhauling boats, decoys, etc. He has not forgotten his old friend, whom he calls "Monsieur Jim." *On a bien tue des canards ensemble. Panore garcon.* He speaks disparagingly of the prospects for this season. The ducks, he says, are getting scarcer every year. There was a time, not long ago, when fifty ducks were considered only an ordinary day's shooting, and it was not an uncommon thing to bag as many as one hundred between 6 and 12 A. M. The mode of decoying, as practiced here, is one which is full of danger and hardship. It requires no small amount of endurance to stand it for one day only. The blind, which is made of ice, is usually three feet high and about four and a half feet square. It is placed close to an opening or channel where the decoys can be laid out to good advantage. The sportsman, stired in a white suit, conceal himself within the blind, and shoots either kneeling or sitting down. In cold weather it is no easy matter to keep warm in such a position. The boat, which, of course, is indispensable, is kept within hailing distance, and convenient for service as required. I would not advise sportsmen to venture out without having first secured the services of a good guide, in which case I can promise them very good sport. ROYAL II.

OLD-SQUAW SHOOTING AT THIMBLE ISLANDS.—New Haven, Conn., March 12.—I have taken your paper for the last four or five years, and not seeing anything about old squaw shooting at Thimble Islands, or anywhere else, thought perhaps I might write a few lines that would interest some of your readers.

Owing to unfavorable reports that the birds were mighty scarce, I did not go this season until a week ago last Friday, when, not being able to stand it any longer, I called on my friend Mac, who is always ready to go where there is any shooting and plenty of roast oysters after it. Landlord's orders, when he sees me driving up with him: "Here, John, catch up a couple of hushels of those best oysters, and tell James to put two loaves of that rye bread to one side till we get back!"

A telegram sent the day before was the cause of Jake's standing on the front steps waiting for us, a gun one side of him, and two baskets of decoys on the other. We decided before starting that we would all shoot from one rock, each taking a different position and dividing the decoys between us. In this way only one boat is needed, and Mac says he is more sociable when lunch time comes. But the best way when two or more go is to each take a different rock (no trouble to find them, as there are 365, one for every day in the year, that comprise what is called Thimble Islands), a quarter to a half mile apart. In this way any duck coming to one set of stools and not being killed seems to think he ain't wanted in that party, and will point straight for any other stool he may see. Then, too, if a duck does not see one set of decoys he may see one of the other sets. I have seen old squaws circle round and come back to decoys from which they had just been shot at. They are, without doubt, thick-headed, and any one who has shot them knows what their bodies are.

As Mac cannot handle a pair of oars with as much skill as he can a knife and fork, he was given a seat in the stern sheets, Jake and myself doing the rowing. Now, why is it that these fellows who can't pull an oar always weigh so much? Golly! how that boat did settle by the stern! Well, most any boat would, with 185 lbs. of man and mountain howitzer (my private name publicly expressed for a 10 bore 11 lbs B. L.) A half hour's row brought us to our destination. Jake and I had just got the decoys set and hardly under cover when we heard Mac's howitzer, both barrels, and with this expression: "Confound this gun! it always takes a shot or two to straighten out the barrel, and I guess it always will." I told him the gun was all right, but that he had forgotten to put in the shot.

The first duck scored was by Jake's 16 bore 30 inch, and was a broad-bill, the only one that has been shot at the Islands this year, which goes to show how scarce they are. Last year Mr. Beatty, of Stony Creek, who is a first-class duck shot, used to kill his thirty and forty pairs in a day's shoot. Mac followed up Jake, making a double shot. Your humble servant brought up the rear by taking an old squaw in the rear, the only part that can be penetrated with any shot smaller than No. 3. I use a full choke 12 bore gun, 30 inch barrels, 4 drs. powder, 1½ oz. No. 3 shot.

After shooting about an hour, which resulted in eight old squaws and one broad-bill, it commenced to rain, and Jake proposed that we go over to Pot Island (the largest of the group) and take a look at the large hotel which Mr. Wm. H. Barnes, of Stony Creek, is putting up in addition to the old one. To this we agreed, and found there a large, three-story building, the first floor devoted to a parlor 30x28, and a dining room capable of seating 100 guests; the second and third floors to the largest sleeping rooms of any house on the shore. Mr. Barnes informed us that he was going to have a duck-boat sent him, and if it suited he intended to have others built, and that he intended to have the finest lot of boats on the Sound—in fact he was going to be able next fall to take care of the coot shooters both afloat and ashore, and I know he will, as he never does things by halves. OLD INDIAN.

JERSEY CITY HEIGHTS GUN CLUB.—In our last issue want of space prevented our giving this club as full a notice as we should have wished. This club, composed of gentlemen who reside in New York, Jersey City and Brooklyn, has the advantage of being in close proximity to the metropolis. In ten minutes time, by the Courtland or Desbrosses street ferry, at an expense of ten cents, you are landed at Marion. The club ground, which is inclosed, has a commodious gun-house, and on the premises traps and glass balls, with a person to attend them, can always be found. It is just the place where a gentleman can try his gun at glass balls, or can find out the penetration or pattern of his new fire-arm. The President of the club is Dr. Burdett, Mr. P. W. Levering is the Secretary, and our well-known correspondent, G. B. Eaton, Esq. ("Jacobstaff"), is one of the directors. The programme

last week was well carried out, and we have every reason to suppose that the Jersey City Heights Gun Club will be highly popular among our leading sportsmen.

THE ECLIPSE LOADER.—This invention consists of a block, perforated with holes, the size of the shells, two trays, also perforated, a pointed implement, a board with plungers, and five boards of different thicknesses. The shells are inserted in the block, which is placed upon one of the trays so that the caps in the shells are over the holes in the trays, preventing explosion. The different thicknesses of board resting in the other tray form the required charge. The tray being slid upon the block to a certain point, the spaces in the block between the shells form a bottom for the tray. The holes in the tray are now filled with powder, and the tray moved forward until the holes are opposite those in the block, when the powder falls into the shells. The tray being removed, the wads are picked up with the pointed tool and inserted in the shells. When all are inserted, they are rounded with the board with plungers. The shot is loaded in the same way as powder, the boards in the tray being readjusted for the proper charge. This loader works fast, is simple, cheap and a saving of labor. It is the invention of Mr. Edwin Schenck, of Baltimore, Md.

FOR THE PARIS EXPOSITION.—Capt. Bogardus has shot 55,000 shots with both barrels of his famous Scott gun. With the exception that the choke is somewhat worn the Captain still puts his trust in the old gun. It is now to have a post of honor in the exhibit of Messrs. Wm. Reed & Son, of Boston, at the Paris Exposition.

THE AMERICAN POWDER CO.—These well-known manufacturers of powder, through their agent in Chicago, Mr. E. B. Rambo, have a just reason for complaint, which we are only too glad to bring before the notice of our readers. It seems that certain dealers when called on for the powder known as the "Dead Shot," and manufactured by the American Powder Co., have substituted other makes of powder with the request to "try it," or adding, "if what we send you does not suit we will ship your order." It is against such unfair dealing as this that the Chicago agent of the American Powder Co. complains. The injury done is rather to the consumers than to the manufacturers, because the purchaser gets a powder he does not like, of the effects of which he is ignorant, and general dissatisfaction arises between the buyer and seller. Such methods of dealing are as unbusiness like as possible, and are sure to recoil on the perpetrators. All that the American Powder Co. desires is that when an order is given for their make of powder it shall be filled. The genuine brand of the American Powder Co., the "Dead Shot," must be insisted on when a purchase is made.—See Advertisement.

—The bill before the Rhode Island Legislature against pigeon-shooting has passed only one branch of the Legislature—the Senate. It has not passed the House, and probably will not.

RUFFED GROUSE IN THE SOUTH.

MR. EDITOR:

LAWTONVILLE, Georgia, Feb. 14, 1878.

Perhaps there is no bird in the whole South about which so very little is known as that species of grouse known everywhere as "pheasants." That they were called pheasants by the first English settlers in Virginia there can be no doubt; for a reference to the letters and to the contemporary books of that period, establish the fact that our forefathers, however brave and chivalrous, were not adepts in the nomenclature of natural history. That men directly from England, who had been familiar—at least many of them—with pheasants, should call a grouse a pheasant, seems simply unaccountable. We see from this that men lose their heads in a new country. However that may be, they called them pheasants, and the name is the only one by which they are known from the spice thickets of Indiana to the mountains of North Georgia and Alabama. That they are the genuine grouse there can be no doubt; yet they are smaller by some ounces than the grouse of New York, Maine, or Canada.

They lie splendidly to the dog in autumn, but they take to the trees later in the season on being flushed, and are shot while watching the dog from their fatal elevation. They are far superior to the plumed grouse of the prairie in respect to their eating qualities, their flesh resembling that of the quail.

On a dark, damp morning in the year 1850, the writer of this paper took his first lesson in pheasant shooting in the hills of the Big Eagle, the home of this beautiful bird: the Big Eagle is in Kentucky. There, Jack —, than whom a better rifle shot never trod the "dark and bloody ground," was my friend and guide, and we left his humble home at daylight on the morning aforesaid.

Skirting the river and running at right angles with it, were numerous oak and hickory ridges. Going up one of these, my guide seated himself at the foot of a large oak, and pulling a corn-cob pipe from his pocket, filled it with "home made" tobacco, and sat dreamily smoking.

The gay and festive squirrel pursued his investigations after acorns at our feet; the sassy tom-tit flitted around us, emitting his querulous notes at the invasion of his territory; a solemn owl perched in the branches of the tree above our heads, at intervals gave a melancholy hoot, accompanying it with bursts of Sardonic laughter at our hallooing on the pheasant question. Presently all became still, when a low, booming noise, like distant thunder, broke upon the soft, spring air.

"Listen," said Jack, as he raised his full six and a half feet aloft, "pheasants, by gum!"

Could that loud noise which I heard booming from the woods around us, be pheasants? Yes, it most certainly was; for the cock pheasants, in the spring of the year, get upon a log and drum by the hour. Sometimes two, or three, or even half a dozen, will be found on the same log, seeming to vie with each other as to which can drum loudest.

Whether this is intended as a call to the female, or as a challenge to mortal combat, I do not know; all I know is that they seem to like it, and that they drum *on anore*. Alas! that this love of martial music is the cause of the death of the brave drummer.

For, behold Jack and myself as we creep cautiously toward the noise. On and on, until through an opening in the bushes, we spy, not one, but three cocks strutting in all their pride and glory on a large, mossy log.

"Now," says Jack, raising his heavy rifle to his eye, "I'll shoot the head off'n that furdert one and you kin try your scatter gun on the other two."

A whip-like crack rang through the woods, and with a convulsive leap that showed that the head had been shot "off'n him" the furdert cock pheasant tumbled off the log. The other two towered up above the bushes, but two great puffs of feathers, streaming down the wind, showed that the "scatter gun," though in the hands of a boy, had done its work right well.

"Well, by gum," said Jack, "if that don't beat my time."

And, truly, it was a wonderful thing to that veteran rifleman, to see those strong, arid birds out down so deftly while on the wing; and I don't believe that I could do it now, although a far better shot than I was then, but in those days I shot instinctively, and sometimes shot splendidly. The Kentuckian, if a rifleman, rarely shoots on the wing, and has a supreme contempt for shot-guns. He stalks his game, and, if small, shoots its head off; if large, shoots it through the heart, and never misses. His rifle is death, and when he looks down its long barrel, there is "most in the pot."

There is a solemn stillness and repose for about an hour, then the same thing is repeated, until at night, Jack has bagged nine pheasants, "scatter gun" eight—and a noble record, too, let me tell you. To those who never shot this bird it seems that, large as it is, you ought never to miss; but when you shoot among oak and hickory thickets, most of whose leaves are still hanging on the trees, when you see a streak of brown careening through the longhills like a mere glimpse, you are a crack shot, indeed, if you can kill half your birds; besides, they are extremely treacherous of life, and the smaller numbers of shot seem merely to accelerate their flight.

But my hunt warns me that I must close this pleasant theme. I thought that I would like to write a little concerning a bird which, alas like too many other of our game birds, will soon be extinct. Pointers, breech-loaders and steam have done their work upon the pheasant as upon nobler game, and unless severe, restrictive laws can be passed and enforced, there soon will be no game except in the traditions of the past. J. W. ST. CLAIR.

MORE ABOUT CHILLED SHOT.

EDITOR FOREST AND STREAM:

I did not intend to write my last communication as "A reply to Mr. Knowlton," and was surprised to find it so headed. To have replied to his article on chilled shot, in your issue of Feb. 1, would have opened a discussion which would occupy so much space that eventually you would be compelled to refuse its publication, and which would be of little interest to the majority of readers.

While correcting some slight errors made by other correspondents I merely took advantage of the opportunity to give Mr. K. the credit he deserved for calling attention to some advantages for chilled shot, not previously claimed for it, purposely avoiding criticizing points most open to criticism. My position being similar to his there could be no intention of such an "implication" as Mr. K's P. 8, in your issue of the 14th suggests, and it affords me pleasure to find that our views on that subject are the same. I write over my own signature that my identity may be certain among business acquaintances and numbers of sportsmen with whom I have passed many pleasant hours in the field, and to them I leave the validity of my opinions on sporting matters. Mr. K. says, "If the range of shot is sufficient to reach the bird there is little fear but penetration will be sufficient to kill it." This assertion might reasonably lead us to suppose the old saying correct about getting salt on the bird's tail; and also, that a spent ball, if it hits, will kill as quickly as any other.

As he claims that "Long range is of much more service than penetration," and kindly informs us "that heavy bodies with similar motive power have a much longer range than lighter ones," why not use lead instead of iron for cannon balls? What Mr. K. says about chilled shot having been made in England is true, but it is equally true that its successful makers there are said to most jealously guard the secret of its manufacture; and when he says that any American manufacturer can make it he makes a mistake in speaking for so many. I know of some manufacturers who acknowledge that they are unable to make it, and still they do not condemn it. It may be a matter of policy to ascertain that an article possesses the qualities claimed for it before staking one's reputation on its manufacture, "would it not be politic not to condemn an article until the desired information had been ascertained? Especially when in his previous communication Mr. K. seemed to acknowledge that it possessed much merit and, which he still concedes, may after "discussion and trial" shine forth in all its beauty, when he, with all other sportsmen, will of necessity speak its praise with voice and gun. "Theory and practice are, in shooting as in most other matters, quite different things" and the sportsmen of America are now doing what their English cousins did before them, convincing themselves of the practical results of using chilled shot; and with them judgment will be unbiased and virtue and truth prevail. Many now using it in the field and at the trap speak in the highest terms of "Improved Chilled Shot." CHAS. RICHARDS.

N. Y., March 18, 1878.

FOR SALE.

"Hammerless Guns," self-loading; 5 guns, "Anson & Dealey's" patent, manufactured by Wesley, Richards & Co., Birmingham, medium choke, 12 gauge, 7½ lbs., with leather case and all gear for cleaning and refilling cartridges complete. The simplicity and strength of lock-action as well as their perfect safety are fast making these guns favorites. Call or address E. Remington & Sons, 281 Broadway, N. Y. P. O. Box 3,994.

PIGEON MATCHES.

PAINE AND BOGARDUS.—A match at Philadelphia, March 15, between Paine and Bogardus, to break the most glass balls in one minute, was won by the former by a score of 18 to 16.

BOGARDUS AT DEERFOOT PARK.—Capt. Bogardus made an attempt at Deerfoot Park, L. I., last Friday to kill 85 out of 100 pigeons, 50 double rises. In addition to the difficulty of the task set before him the Captain was disappointed in not having the gun which he desired for the occasion; and the wind not blowing the smoke away in time the shooter often could not see the second birds. The birds were a lot of remarkably fast flyers, and it was the common remark of the veteran pigeon shooters, who were present in full force, that the birds had never been equalled in this country. One of the birds was found 127 yards from the trap with 10 pellets of shot in its body. There were very few birds which were not believed to have been hit, while six fell dead out of bounds. The following is the summary:

RECAPITULATION.

Brooklyn Driving Park, Parkville, L. I., March 22.—100 double birds; ground traps; 21 yards rise; 100 yards boundary; 1½ oz. of shot; Long Island rules.

Score.—10 11 10 11 10 11 00 10 11 01 10 00 11 10 11 00 11 10 11 01 11 01 10 11 11 10 00 11 11 10 00 01 11 10 00 11 11 10 11 11 10 00 11 11

Total, 100; killed, 63; missed, 37.

Referee, Dr. Talbot, New York.

Time, One hour and thirty minutes.

LYNN (Mass.) CENTRAL SHOOTING CLUB.—This club organized in December last, and numbers on its roll some eighty-three active members. The following are the officers of the club: President, E. W. Webster; Vice-President, W. C. Haskell; Secretary, Frank Hollbrook; Treasurer, S. T. Downs. Executive Committee—E. W. Webster, W. C. Has-

No Notice Taken of Anonymous Communications.

RON ROY and NAUTILUS, Gilsey House.—Please give the respective merits in sailing of the Nautilus and the new Shadow canoe. Ans. The Shadow is quite equal to the Nautilus on the wind, while before the wind her speed is at least one-third greater. She is much the stiffer of the two, and decidedly the better sea boat whether under sail or paddle.

W. F. J., Richmond.—1. What would you think of a combination of vasoline and beeswax as a lubricant for rifle balls? Ans. We think it would not be stiff enough for warm weather. We prefer wax and tallow. Ques. 2. Give us the best authority on offhand shooting. Ans. Full instructions may be found in Wingate's Manual, or in "Hallock's Gazetteer."

VANE AT CREEDMOON.—Please give us some idea of the vane at Creedmoor. Ans. Height from the ground, 28 feet; diameter of clock face, 5 feet 6 inches; height from ground to bottom of clock face, 12 feet; length of rod, 12 feet; length of vane wood work, 7 feet 6 inches; width, 14 inches; rod, 4 feet 6 inches to point; height of tripod, 24 feet; 12 feet between the legs.

DEXTER, Albany.—Tell me the difference between draw and choke-boring? They both have the same effect, I believe. Ans. Draw-boring is when the barrels are decidedly tapered. The effect on the barrel is to lead the barrel along a certain length. They present no advantages over choke-boring and we think are not quite as effective as guns which are choked.

F. A. C., Norfolk.—I have a setter dog one year old and have been much annoyed by his hair falling out. It does not fall out of its own accord, but if he brushes against anything it comes out readily. He seems in good health and spirits. Can you tell me what the matter is and the remedy? Ans. Regular food and plenty of exercise, with the use of a stiff brush.

LAPIS, St. Johns, B. S.—Can a six year old dog that has had mange for the last three years be cured? Numerous remedies have been tried, but to no purpose. Ans. Chronic mange of such long standing is very difficult to cure, but if the dog is kept on proper diet, given a clean bed and plenty of exercise, persistence in the application of proper remedies will generally effect a cure.

H. V., Woodbridge, N. J.—1. I wish to spay a mastiff bitch pup. Advise me when it should be done? 2. Will it stunt her growth? 3. Who could do it? Ans. 1. From four to five months old is a good time. 2. If spaying deprives in a certain way muscular strength, in bulk there is not any appreciable difference. 3. We should suppose a surgeon in your neighborhood would be glad to do it.

J. H. P., Taunton.—In a pond which has not been fished since it was stocked five years ago with black bass, and where pickerel are very plenty, which will be the best, bait or fly? Or would a spoon be good? Ans. It depends upon the weather, the time of day, season of the year, stage of water, natural food supply and a dozen other conditions. All your baits are good. Better try them all. The result will decide.

W. B. S., Cincinnati.—I have a space 45x66 feet set apart for a dog kennel. I will keep two dogs. Would you recommend sodding it, or would you cover it with gravel? Ans. We should advise a dry soil, and make with a slight slope, or slope down on both sides to a gutter. No harm in having the ground sodded if in a warm climate, but in your latitude would advise gravel, so that soil could be changed at times.

C. R. T., Painesville, Ohio.—1. When will Capt. Bogardus' new book be out? I know it is advertised, but the booksellers in Cleveland say that it is not yet out from the publisher's hands. 2. How many pellets would you call a good pattern in a target 12x18 at 50 yards, No. 8 shot? Ans. 1. The book is out and can be had at this office, price \$2, and mailed to you. 2. About 110. Still hard to state as your target is not standard.

C. F., 136th St., New York.—Where can I go to, a convenient distance from New York, to try my gun? Ans. No better place or more convenient than the grounds of the Jersey City Heights Gun Club at Marion. From the city, foot of Cortlandt st., to Marion, it is about fifteen minutes, at a cost of ten cents. Balls, traps and man always in attendance. We take great pleasure in recommending the Jersey City Heights Gun Club.

E. A. P., Lakeville, Mass.—My pointer when two years old had the distemper and it left him with a twitching of the muscles of the head. Upon the left side the muscles above the eye have shrunk away, which makes head one sided. Twitching incessantly and about eighty throbs per minute; dog is in good flesh and appears perfectly healthy. Ans. The dog cannot be cured. You may try ½ gr. of nux vomica twice a day for a month and note effects.

C. M., Dauphin, Pa.—Where can I purchase the McClellan saddle? Can it be bought in Texas? What is the origin of the Texas cattle? Ans. The McClellan saddle can be bought in this city, but it would be better for you to fit out at Austin, or San Antonio, where the most suitable saddles can be bought. The best Texas saddle is made at New Braunfels. Twenty cattle brought from France in 1692 by the missionaries are said to be the ancestors of the Texas cattle.

C. C. H., Indianapolis, Ind.—I am expecting to coast the North Shore of Lake Superior from about Port William east to Saint Sto. Marie the coming season. Can you tell me where I can get a reliable map of the North Shore upon a scale sufficiently large to be of use on such a trip? How can I ascertain times of sailing of the Canadian steamers for the upper lake? Ans. Write to Barlow Cumberland, agent of Collingwood steamers, 35 Yonge street, Toronto, Canada, for map and dates of sailing.

P. H., Bloomington.—1. How would you commence the study of Botany? 2. My dog, setter, will roll in all the filth he can find. How can I cure him? He is one year old. 3. Have a Genez muzzle-loading gun to bore, weight 9½ pounds. What is a proper load? Ans. 1. Send to Orange Judd & Co., N. Y., for "Gray's Hand and Field Book of Botany." Price \$2.50 and \$1. 2. Hard to cure, as it is a natural instinct. Speak to him and inflict slight punishment. 3. 4 drs. powder, 1½ oz. shot.

H. S. M., Albany.—A spaniel of mine, seven months old, has been up till now in good health. To-day he will not eat and does not seem to have any life in him. He lies around the house listless, shivering and shakily at times. A lump has grown between his eyes which has increased to the size of a walnut. Have given him quinine. What is the matter? Ans. Description insufficient. The lump or tumor may have some connection with the brain and in this way account for the symptoms.

A. S. T., Oriskany.—1. What time do bass spawn, and how long do they watch the bait after spawning? 2. Where can I find good bass fishing without going too far from Oneida county? What hooks and bait, flies, artificial bait, or worms? Ans. 1. They begin to spawn about the middle of May and watch the beds for eight or ten days, or until the fry are hatched. 2. You will find all your questions fully answered in "Hallock's Sportsman's Gazetteer," for sale at this office; 900 pages; price \$3.

SPORTSMAN, Newburg.—1. Are the wild fish and chub the same fish and if so do they take the fly like the trout? What time is the best to teach them? Also what is the best fly to use? 2. Is there any trout

fishing near Black Lake, Sullivan county, N. Y.? Ans. 1. We do not know the wild fish. Chub will often take a fly and afford fair sport. 2. Yes. For principal trouting localities in Sullivan county see Hallock's "Sportsman's Gazetteer." Chub begin to bite in April. They take the same hook as the trout.

ANATEUR, Clearfield, Pa.—In the article of "Nauticus" on boat building, published in F. and S. of August 2, 1874, is not the word stern used wrongfully for the word stem several times in succession, beginning with "The dimensions, etc.," immediately above diagram No. 1? Ans. Yes; and attention was afterward called to the fact through the paper. The writer was instructed to substitute the word bow thereafter, as it is quite impossible to distinguish stem and stern as written in ordinary manuscript.

F. D. P., Attica, N. Y.—Which is the best time to stock a creek Via Tonawanda? It is small but the water is good. What kind of fish would you advise? How far above a dam would you put the fish? Ans. Send full description of your water, size of pond, height of dam, number and size of tributary streams, contour of country adjacent, kind of trees on banks of stream and ponds to Selb Green, Rochester, N. Y. State character of bottom, whether gravelly or muddy, the kind of fish now and formerly in the water and the temperature of water.

J. L. W., North Manchester.—My pointer pup, 8 mos. old, has been confined in a pen or to a kennel for six weeks; fed twice a day on boiled Indian pudding, meat and bones from table; has a good appetite, and is in good condition every way with the exception of his eyes; Three months ago his eyes commenced running. The inside of the under lid and the fleshy part in the corners of eyes appear to be inflamed and swollen. Ans. Wash the eyes with warm water two or three times a day, and give plenty of exercise and no meat for a month.

A. B. C., Boston.—How can pickerel be got rid of from a pond of fifty acres which it is desired to stock with other fish? Where may Prussian carp be obtained for breeding? Ans. You cannot get rid of the pickerel without liming the pond, which process will not only kill the pickerel, but everything else vegetable and scaly in it. The best thing to do is to put in black bass and sunfish, the latter for food for the larger fish. Mr. T. B. Ferguson, the Fish Commissioner of Maryland, will be able to obtain Prussian carp for you. Mr. Ferguson's address is Baltimore.

A. H. C., Canadawaga.—1. What substance is used with plumbago for a permanent coating for the hulls of yachts and the masts of applying it? If varnish is used what quality that will stand under water? 2. What work is published giving information on rigging boats, masts of ropes, in fact general information on the subject, together with sailing? Ans. 1. Dissolve 15 pounds orange shellac in 4½ gallons alcohol. 2. Buy "Alston's Seamanship," Wiley & Sons, 15 Astor Place, N. Y. Brady's "Kedge Anchor" is excellent, if you can obtain a copy; but it is out of print.

J. R., Minneapolis, Mich.—1. What is the penetration and accuracy of the — rifle? 2. Would you advise me to use a —, or a —? 3. What is the cost of each? 4. Had I better get a shot-gun here, or send East for it? 5. How are the guns which Mr. Squires advertises? 6. What cal. gun shall I use for general shooting? Ans. 1. Both are excellent. 2. Decline answering. 3. The first rifle costs \$35 to \$60, the second \$35. 4. Generally, arms can be purchased cheaper East. 5. Personal examination of Mr. Squires' guns has convinced us of their excellence. 6. No. 10.

C. A. R., Taunton.—1. Can white perch be taken with a fly, and if so what are the best colors to use? 2. Have the American widgeon, the wood duck, the green and the blue-winged teal and the scarp-buck ever been domesticated enough to breed from them? Please give me the address of some one who keeps them. Ans. 1. White perch are bottom fish and do not take the fly. For several chapters on white perch, modes of capture and localities for fishing see "Hallock's Sportsman's Gazetteer." 2. Some of them have. Address J. H. Batty, New Utrecht, Long Island.

HENRY, Rawsonville.—1. Will a 11 pound 32 inch .44 rifle, with a 28 inch sight gain twist, be sufficient to handle either an Express or 1½ inch Creedmoor ball? 2. Would it be more apt to tear the patch than an even twist? 3. Which would be the better place for a gun maker to locate, Ind., Ill., or Texas? 4. What is the address of Mr. F. Yamada, N. Y., teacher of Japanese? 5. How are bullets for muzzle-loaders, which are patched with paper, "driven home" without tearing the patch? Ans. 1. It will. 2. Would not. 3. Believe Texas would be the better place to locate. 4. Mr. Yamada's address is No. 97 Front st., N. Y. 5. The bullets enter easily into the barrel and the paper is not disturbed.

G., Mayville, N. Y.—A controversy has arisen as to what certain birds are. Without killing any I send you a description thinking you can tell what they are. In size they are about like a blue bird; back and wings smooth, calid color, breast and belly between a dun and yellow growing whiter toward the tail. Head heavily crested, black streak from bill up past eye, with fine white streak under it. Wings, white streak on back, dory red on tip. End of tail bright yellow. Here now in flocks, sitting quite tame on trees half a day at a time in stormy days. (Amphisp. caeruleum.)

H. C., Mullersberg, Pa.—Some weeks ago a dog passed through our town said to have had hydrophobia. He bit several dogs, among them a pointer. After the pointer was bitten he was used to line a bitch and immediately thereafter he took hydrophobia. Will there be any danger of his progeny being subject to the same disease? Would you advise the rearing of the puppies? Ans. Kill the progeny at once. You would be culpable did you act otherwise. [The editors beg to state that on the receipt of this communication a letter was immediately written to H. C., embodying this advice. It is a common error to say a dog has hydrophobia. It is the unfortunate human being who has hydrophobia; the dog has rabies.]

F. N. S. B., New York.—Is there any place within fifteen miles of New York where there is rest good snipe shooting? 2. Is the action of the breech-loading guns of — as strong as that of the —? 3. I have a first-class muzzle-loading English gun made by Lang. It cost \$150. Would you advise it being made into a breech-loader? If so, where is the best place to go to have it done, and about what ought it to cost me? 4. What is the best thing in rears or rust from a gun? 5. To what part of the Adirondacks is the best quail and partridge shooting? Ans. 1. Hackensack Meadows and Rockaway Beach. 2. Respectfully decline answering. 3. Would not advise the alteration. 4. Oil and a scrub-brush. 5. No quail, but ruffed grouse in the Midway Range.

J. W. J., Brooklyn.—1. I am going to Texas. Would a repeating rifle be better than a single shot for general shooting? 2. If so which would you advise me to take, a — or —? 3. Would a — rifle be a good single rifle for general shooting? 4. What cal. would you advise? 5. Would a double barrel gun, one barrel rifle and one shot be a good one for general shooting? 6. Would you advise me to take a saddle from here, or could I get one there cheaper than I could take one from here? Ans. 1. We think a magazine gun is the gun of the future. 2. Both equally good rifles. 3. It would. 4. .41. 5. Yes, under certain circumstances, though we are not advocates of a barrel-made-up shot-

gun and rifle. You can get no end of good saddles adapted to Texas at San Antonio, or Houston.

S. W. C., Bowling Green, Ky.—You will greatly oblige me by referring me to the best practical work upon artificial fish culture. I wish to familiarize myself with all the methods and manipulations of the art, as well as to master the principles of science. You will know what I need. Ans. There are no American works on fish culture excepting Stone's "Domesticated Trout," a very valuable work on that branch, and Norris' "American Fish Culture" which is much more comprehensive, but having been published ten years ago is now somewhat out of date under the revelation of later discoveries and experiments. Seth Green has printed a pamphlet of 160 pages on shad culture. The pages of FORREST AND STREAM contain more on the general subject than all other publications put together; for our leading naturalists and fish growers have contributed what they know relative to bass, carp, shad, salmon, perch, eels, graylings, gold fish and the great variety of food fishes.

H. C., St. Joseph, Mo.—Mr. B. was at the score killing for his bird and gave the cautionary signal to the pulper, "Are you ready?" He received no reply and turned around to see what was the delay, but just as he turned the pulper threw the trap and, being excited, Mr. B. turned and fired at the bird, but missed it; therefore declared him bird. He appeals from the decision. Our rules read: "Should the shooter be in any way balked by his opponent, or by any other party, he can claim another bird, with the sanction of the referee." "The pulper shall, in all cases, pull fairly and without delay. If the referee shall be satisfied that the trap was not pulled fairly, and without resort to any kind of handling device, he shall order the bird to be scored for the shooter, though not killed within bounds." Ans. Our decision is that the bird was lost. If the shooter had not fired at the bird he would have been entitled to another bird under the plea of having been balked. He accepted the bird by firing at it.

H. J. Mc., St. Paul, Minn. Please prescribe for my setter dog, age 2 years; slight cough for some time, lately discharges a greyish, mucus-like fluid from the nostrils; nose hot and tender, and hurls him to sneeze. Eye dull and heavy, movements languid; appears to be stiff across the kidneys. Appetite fair, coat healthy, condition good. Food, oat and corn meal, mush and scraps from table, with now and then some raw meat. Thought he had distemper and gave him a dose of syrup of buckthorn and occasionally some sulphur in his water, or in milk. I have kept him tied up during the winter in a good kennel and gave him exercise frequently. Ans. The dog probably has an aggravated catarrh, or the epizootic disease after having his bowels mured by castor oil. Give 2 grs. of quinine four times a day. Cleanse his nostrils and inject a strong solution of chlorate of potash three times a day. Keep warm and dry. Fumigation of the dog's nose with turpentine tar and feathers may do good instead of the potash wash.

AVIS, Utica.—1. What is your theory that shells too short for a breech-loading gun will make it recoil? 2. What would be the effect of using a shell too long for the chamber of a gun? 3. Are paper shells more liable to produce recoil than corresponding brass ones? 4. Is loading in the shell chamber of a gun due to using too short shells? If not what are the principal causes? 5. What pattern ought a wire cartridge to make under these conditions: 1½ oz. No. 8 shot, ¾ dr. powder, 12 bore 7½ pound gun, 30 inch target at 40 yards? 6. What is Messrs. W. and C. Scott & Son's stamp on their guns? 7. Is there any real advantage to be derived in using chilled shot for ordinary shooting, and are No. 12 and dust shot made of chilled shot? Ans. 1. We do not think recoil would be appreciable unless the chamber had a shoulder. No theory. 2. Then you would have recoil. 3. No. 4. Can't see how a short shell can load the chamber. 5. About 28. 6. Mark the target with a flag in a circle. 7. See our columns for answer to this which otherwise would take a page of explanation. All sizes of chilled shot are made by the Tatham.

S. H., Jonesboro, Tenn.—Why is the South called Dixie's land? Ans. We saw not long ago in the New Orleans Delta a communication which gave one explanation as follows: "I do not wish to spoil a pretty delusion, but the real truth is that Dixie is an indigenous Northern negro refrain, as common to the writer as the lamp-posts in New York city seventy years ago. And no one ever heard of Dixie's land being other than Manhattan Island until about the time of the late war, when it was erroneously supposed to refer to the South from its connection with pathetic negro allegory. When slavery existed in New York one Dixie owned a large tract of land on Manhattan Island and a large number of slaves. The increase of the slaves and the increase of the abolition sentiment caused an emigration of the slaves to more thorough and secure slave sections; and the negroes who were thus sent off naturally looked back to their old home, where they had lived in clover, with feelings of regret, as they could not imagine any place like Dixie's. In those days negro singing and minstrelsy were in their infancy and any subject that could be wrought into a ballad was eagerly picked up. This was the case with Dixie's."

C. H., Rowley, Mass.—1. Will you please inform me in what State the best hunting and trapping is found—beavers, otters, deer and fishers for example? 2. Also partridges, quail, grouse and woodcock. 3. Please tell me the market price of beavers and otter skins? 4. What are the prices of the different sizes Newhouse traps? 5. What is the best kind of rifle? 6. What is the best kind of revolvers for long ranges? 7. Also tell me the best kind of dogs for large game? Ans. 1. Arkansas, Missouri and Mississippi in the South; Wisconsin and Montana in the West; Virginia in the Middle States; Maine and Vermont in the East. 2. Grouse, quail and woodcock are widely distributed. The grouse is not found south of Virginia, and the quail is not found in numbers north of Massachusetts. 3. Beaver (northern) skins \$2 to \$3; \$1 to \$2; southern, 50c. to \$1. Otter, northern and eastern, \$5 to \$8; western \$2; southern, 50c. to \$1. 4. Newhouse traps are numbered 2 to 6, the larger being the largest. The set can be bought for \$14, if we are not mistaken. Our price list is mislaid. 5. Depends upon the kind of shooting to be done. [See Hallock's "Sportsman's Gazetteer."] 6. The regular army Smith & Wesson are the best shooters. 7. Hounds for deer and bear-dogs for bears.

A. B. C., Norristown.—1. Does a 31 in-b. 44 barrel rifle burn 100 grs. of powder with more advantage than a 31 inch barrel .44? 2. If so are not 34 inch Creedmoor rifles superior in point of range to all shorter barreled Creedmoors that use the same charge? 3. Cannot a Creedmoor rifle be used for offhand match shooting with as good results as a mid. or short range rifle? 4. Will a Creedmoor rifle and shell loaded with 50 or 60 grs. powder and 550 grs. lead, and the price filled with wads and sawdust, shoot as well as a 40 or 60 rifle? 5. What are the objections to using a Creedmoor for offhand match shooting? Is it the length, weight or balance? 6. I can only afford to buy one rifle, and if you do not know of any good reason to the contrary had I not better buy a Creedmoor for all purposes? 7. Will not the 24 inch — shot further and more accurately than the — 32 inch? 8. Can you give me the name and address of a good riderman who uses the Creedmoor rifles for offhand match shooting? Ans. 1. There is no difference. 2. No. 3. Certainly it can. 4. It will. 5. There is no objection. The best shooting made by many Creedmoor rifle men in off hand matches is made with a Creedmoor long range. 6. If for match shooting by the Creedmoor. If for all purposes, in the woods, or for game would prefer a shorter rifle. 7. It will not. 8. Address Major Fulton, care of Fowler & Fulton, Broadway, N. Y.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INOCULATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

—AT—

No. 111 (old No. 103) FULTON STREET, NEW YORK.

(Post Office Box 2332.)

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Twenty-five per cent. off for Clubs of Three or more.

Advertising Rates.

Inside pages, nonpareil type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial columns, 50 cents per line.

Advertisements should be sent in by Saturday of each week, if possible.

All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

* Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, MARCH 28, 1878.

To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith and be addressed to the FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. No anonymous communications will be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of the mail service if money remitted to us is lost. NO PERSON WHATEVER is authorized to collect money for us unless he can show authentic credentials from one of the undersigned. We have no Philadelphia agent.

Trade supplied by American News Company.

CHARLES HALLOCK, Editor.

AN ALLEGED CASE OF CRUELTY.

IT is a duty of the FOREST AND STREAM AND ROD AND GUN to its numerous constituents, to take cognizance of all communications addressed to us. Sometimes the topics presented are not of an agreeable character, especially when a conflict arises between sportsmen and associations for the prevention of cruelty to animals. Thoroughly as we may indorse such societies, giving them full credit for having induced a broader humanitarianism, we are forced to declare that in their actions they often transcend the dictates of justice and common sense. Their fault is that over-refining of feeling, which Huxley designates as "the cursed sentimentality of the present age."

A case in point, to which we call attention, is as follows. In the discussion of this subject we will try to be as moderate as possible, giving both sides of the question: A gentleman in Boston, well known and respected, while quietly walking in the street with his setter, a timid and inoffensive animal, was called upon to protect his dog from being throttled by a large, vicious, cross-bred dog, weighing some 125 pounds. The owner of the setter finding that he could not drive off the big dog with his cane, used his pen-knife, cutting the assailing dog once while he had the setter by the throat, and cutting him a second time after he had driven him off. For this act—cutting the dog a second time—the owner was criminally prosecuted by the Massachusetts Society for the Prevention of Cruelty to Animals, and was fined forty dollars. Desirous of being fully informed, we wrote to the Secretary of the Boston Society, and were favored with an immediate reply. The secretary of the society states that the defendant in the case "did not stop when he had separated the dogs, and the danger had ended, but had followed the St. Bernard about one hundred and fifty feet, and then again used the knife upon

him. It was this which seemed to us without justification." [The italics are our own.]

We cannot agree with the secretary. From what we can understand of the case, the larger dog was a vicious brute, and should have been exterminated on the spot. Suppose the aggressor in this case had been a panther, could he not have been killed? Of course the character of the individual who used the knife, and his motives in such a case, ought to go for a great deal. The second wound might have been inflicted when, in the opinion of the person who used the knife, the larger dog was in the act of returning in order to inflict further injuries. In his judgment, the smaller and weaker dog was in constant peril while the larger dog was within sight. About one hundred and fifty feet could be traversed by a dog or a man in a very brief period of time. A man having a vicious dog, and not taking care of him in the street, is likely to have his dog killed. Common sense dictates that such a dog should be gotten rid of in case he makes an attack. The owner of the vicious animal, had he been killed on the spot, could not have reclaimed damages, and a cross between a St. Bernard and a Newfoundland, when his anger is provoked, is about as dangerous an animal as can be met with. If the person whose dog had been punished, or even killed by a vicious dog, on one day, was to return the next day, or in a week's time, and then inflict injury on the aggressive dog, then, perhaps, something like deliberation could be shown; but in the heat of the moment, that a person used a knife twice, at necessarily very short intervals, we believe was perfectly justifiable.

The secretary writes: "The fact that the Court adjudged Mr. ——— guilty, and fined him forty dollars, and that after appealing from the decision at the time, he subsequently paid the fine, are facts which should be conclusive that the act was not defensible." We by no means consider that this is in the least a conclusive argument. Persons may not be desirous of continuing litigation, and though the decisions of a bump-tious justice may be in direct opposition to common sense, it is sometimes wiser to leave a disagreeable matter as it is. A man dreading notoriety, or a poor man, may be mulcted forty dollars in the most unjustifiable way, and have neither the inclination, time nor means to carry his case to a higher and wiser tribunal.

The secretary writes us: "I am told the knife had four blades, and the largest was used in the attack." The knife, we beg to remark, might have been a gardener's pruning knife, or a Bowie knife, or one with twenty blades, and a cork-screw to boot, and the character of the instrument would not have altered the case. We are only sorry that Mr. ——— did not use a pistol or a bludgeon, so that the larger dog had been killed on the spot.

To conclude, we are of the opinion that the decision of the Boston Justice was in opposition to equity and common sense, and that even if a fine had been inflicted, which we do not allow, the penalty of forty dollars was exorbitant.

Such a judgment inclines too much in favor of a powerful association, and to the prejudice of individual rights, and just such a case as this, urged by the Society for the Prevention of Cruelty to Animals, tends to bring them into discredit.

We are equally positive that the stigma of cruelty cannot be affixed on the defendant. He did exactly what anybody else would have done under the circumstances, when the life of a valuable and inoffensive dog was imperiled.

A NOVEL MONSTER.

FOR the past few years we have had quite a surfeit of the sea serpent, and people have become somewhat tired, not only of the animal itself, but also of the voracious (?) mariners who would persist in seeing it and in making all sorts of affidavits concerning its appearance and habits. It is fortunate, therefore, that, just at this time, news is received of an animal which, if all accounts be true, is no less wonderful than the sailors' old stand-by, and which has this advantage over its marine rival—that it inhabits the bowels of the earth instead of the depths of the sea. The Pawnees have a saying to the effect that you cannot follow the trail of a fish through the water, or a wild goose through the air, but to track a horse on the prairie, or to trace out the burrow of a mole in the ground, is easy enough. Happily, the new monster of which we write, does not confine himself wholly to subterranean depths, but occasionally visits the regions of light; and fortunately, also, his dimensions are such that when he burrows near the surface of the ground his excavations are easily discoverable, and, indeed, are on such a large scale that they remain for years little altered by exposure to atmospheric influences.

It is unfortunate that the habitat and range of the Minhocao, as the creature is called, so far as at present ascertained, is in the southern province of Brazil, among the high table-lands, where the rivers Uruguay and Parana take their rise; unfortunately, we say, because the scene of its labors is so far from scientific centres that considerable time must necessarily elapse before material for a complete biography of the animal can be procured; because, too, the carping sceptics of the present day will no doubt attempt to discredit the announcement of its discovery, and by their ingenious arguments may succeed in deceiving even the very elect. But we shall hope for better things, trusting that before long such authentic details may be received as will put the existence of the Minhocao among the accepted facts of science.

In a recent communication to the *Zoologische Garten*, Herr Fritz Muller gives an account of our monster, which is termed a gigantic earth-worm, and is spoken of as being 150

feet in length and fifteen in breadth, and is said to be covered with a coat of mail. The letter gives the particulars of several occurrences of the Minhocao, but we are forced to acknowledge that, so far as beard from, the animal itself has not yet been seen by any person except the natives, although his works have been examined by more than one European. The creature is variously described as "of gigantic size, nearly one metre in thickness, not very long, with a snout like a pig;" "as big as a house;" "an enormous worm-like, black animal, about twenty-five metres long, and with two horns on its head;" its skin is said to be as thick as the bark of a pine tree, and formed of large and hard scales, like those of an armadillo. We gather, too, that it is an animal fond of moisture, living in swamps and morasses, from which it emerges only during, or just previous to, rainy weather. During its excursions it appears to proceed just beneath the surface of the ground, forming trenches like those made by our moles. If a huge pine happens to stand in its way it just uproots the tree and goes on; it also plunges over cliffs into rivers, and in fact seems quite at home in all situations.

Whether there is really any basis of fact at the bottom of all these stories it is hard to say, but from the circumstantial manner of the narration and the number of cases given, it certainly seems likely that it has some foundation. Granting that where there is so much smoke there must be some fire, the description given is altogether too meagre for us to venture any conjecture as to what the creature may possibly be. The probabilities would seem to be in favor of its bearing some relationship to the Post Tertiary Edentates which once flourished in such wonderful abundance and variety in South America. The largest armadillos of the present day are only about four feet in length, and should the Minhocao turn out to belong to this group he would prove a most interesting addition to it. It is well known that many of the armadillos are hurrowers, and pass a considerable part of their lives beneath the surface of the earth. The little *Chlamyphorus* is especially subterranean in habit, and might make somewhat such traces as those referred to, differing, indeed, only in size. We shall await further news on this subject with no little anxiety.

SALMON IN THE COLUMBIA RIVER.

THERE is now upon the calendar of the Senate a bill for the protection of the salmon fisheries of the Columbia River, recently introduced by Mr. Mitchell, of Oregon, who will call it up soon for reference, but before having it referred will address the Senate upon the importance of legislation in this direction. The bill has a lengthy preamble, declaring that in consequence of a general disregard by the fishermen of proper regulations and conditions necessary to protect the annual spawn of the fish, and in consequence of the pollution of the waters of the various rivers and shore-lines of the bays of the Atlantic coast, by saw mills, manufacturing establishments, and the drainage of towns and cities, the supply of salmon in the rivers of the Atlantic sea-coast has so largely decreased as to be now of little consequence, greatly to the detriment of commerce; and that there is danger of the supply of salmon in the Columbia River and its tributaries, now so plentiful, suffering a similar decrease within a few years, unless suitable laws and regulations are made and enforced to insure the requisite purity of the waters of said rivers, and the annual deposit of fish spawn therein. It then provides that it shall not be lawful to catch or fish for salmon in the waters of the Columbia river or its tributaries, by any means whatever, in any year from the 26th day of July to the first day of October; such period being the best portion of the spawning season in that river. The penalty for a violation of this section is a fine of not less than \$1,000 nor more than \$1,500 for the first offence, and for any subsequent offence the same fine and imprisonment, at the discretion of the Court, not exceeding twelve months.

The second section of the bill makes it unlawful to catch or fish for salmon in that river or its tributaries from the first day of April to the 26th day of July of each year with gill nets the meshes of which are less than 8½ inches diagonally, or with seines the meshes of which are less than 5 inches diagonally when extended, or with wires or traps the slats of which are less than three inches apart on the pocket or seine pond. And during said closed season, from July 26th to Oct. 1st, there shall be an opening at least three feet square through the pocket of the trap to let the salmon pass freely through. Any person or persons violating the provisions of this section or encouraging its violation by purchasing salmon knowingly so unlawfully caught shall be fined not less than \$500 nor more than \$1,000 for the first offence, and for any subsequent offence shall be fined not less than \$1,000, to which may be added imprisonment for not more than twelve months, at the discretion of the Court. The act, however, is not to be construed as to prevent any person from taking salmon for the purpose of securing the spawn or of propagation of the same in said river or its tributaries. It is also made unlawful for any person to deposit sawdust from any sawmill, or refuse of waste liquid, bair, lime-water, tan-water from any hide or leather tannery, or poisonous waste liquid, or compound mineral, or chemical liquids, or substance from any woolen or cotton factory, or dyeing or chemical or gas works or establishment, into the river or any of its tributaries, from the first day of July to the thirty-first day of December of any year; and every person guilty of violating any of the provisions of this section shall, on conviction, be fined not less than \$500 dollars for each and every such violation.

The remaining sections of the bill confer jurisdiction upon the U. S. District Courts of the State of Oregon, and the Territories of Washington and Idaho. Any person who shall first inform the U. S. Attorney (and through whose information a conviction shall afterward take place) of a violation of the provisions of this act shall be entitled to half of the fine which the person contravening the law shall be compelled to pay. The money collected for violations of the act are to be paid over to the Secretary of the Treasury, and he disbursed, under his direction, by the Commissioner of Fish and Fisheries in the protection of salmon spawn and in maintaining establishments for the propagation of salmon in the Columbia River. In default of payment or giving proper security for the payment of any fine the offender shall be committed to the county jail until such fine and costs are paid or secured to be paid, or until he shall have been imprisoned one day for every two dollars of such fine and costs.

Washington, D. C.

R. F. B.

GRAZING LANDS IN TEXAS AND COLORADO.

SOME time in January a gentleman casually inserted an advertisement in our columns (paying fifty cents per line for the privilege of using the editorial page), inquiring for a sheep rancho in Colorado or Texas, and proposing a partnership in the purchase. Although that was nearly three months ago, we are even now receiving from that one advertisement proposals and letters of inquiry—some to purchase and some to sell; so that it is evident that there is an active interest taken in agriculture and grazing, which must soon lead to an activity in trade and immigration. There is no doubt that thousands of merchants who have met with disaster within the past five years are turning their attention to other branches of business. Agriculture, stock-raising and grazing offer the safest investments, the surest returns, and, in the long run, the largest profits. In our last week's issue we showed, by tabular statements, based on facts, what can be done in Minnesota. The same estimates will apply to Texas; at the same time its more genial climate affords various sources of income to the farmer not found in Minnesota. In our Texas letter, which we print to-day, may be found some statements which will surprise Northern readers, and possibly enable them to reach a decision which they would otherwise be unable to do. However, in order to aid those of our readers who look to us for information and advice, we will furnish what the advertisement referred to has elicited, as follows:

F. S. H., of Boston, knows of one excellent rancho, unstocked, and one well stocked, in Texas.

W. H. D., of Ashtabula, Ohio, has 950 acres in the heart of the grazing country, on the Government road, 14 miles west of San Antonio, crossed by the Medio Creek, and holding a beautiful lake of three acres. On the banks of the creek is a very fine stone quarry of lime rock, for which there is a good demand in San Antonio. Will sell the tract for \$5,000 cash, or part cash and payment at 10 per cent.

T. D. G., Philadelphia, has 2,314 acres in Burleson County, Texas, and another tract of 13,142 acres in Robertson County, low for cash.

H. W. M., of New Rochelle, N. Y., has 4,428 acres (one league) of mesquite prairie land, in Wichita County. The Big Wichita, a brackish river, runs through it, and it is watered by fresh streams; also a rancho, three miles away, has 5,000 head of cattle, and Wade Hampton has a rancho beyond.

J. C. C., New York, has some fine grazing land in Texas.

J. L., of Galveston, offers fine grazing lands in Texas, a large live-oak grove, surrounded by 200 acres prairie, 65 miles east of San Antonio and 160 miles west of Galveston; outbuildings, hedges, fences, running water, etc. Price \$7,000 for the whole, or \$4,000 for the prairie alone, with all improvements. Half cash; balance in twelve months, or the last payment discounted at 10 per cent. for cash.

J. G. K., of Boston, has a claim to two lots of 640 acres each, to be located in any lands in Texas not taken up. Price not stated.

J. E. S., of Rockport, Mass., has 700 acres of land in Colorado, nearly all fenced, outbuildings, an unfailing creek of pure water. Twice as much additional grazing land, which belongs to a bankrupt estate, adjoins this, and can be bought cheap; about twenty miles from Denver, and near railroad station. Terms not stated.

J. J. L., Pueblo, Col., has a finely located range for cattle or sheep. Price \$3,000. Took it for debt. Is considered dirt cheap.

B. L., of Hartford, Conn., has a fine range with a splendid lot of sheep on it. Will sell the whole or part.

D. L. D., of St. Louis, will sell a range in Ellis County, Kansas, on K. P. R. R., 160 acres grazing and 40 acres broken, for \$2,800, or the range alone for \$1,400. Breeding stock to sell low; clear water; also range of 200 acres, distant 20 miles from Hays City. Cause of sale, ill health.

B. E. W., of Cheyenne, Wyo., has a sheep range, twelve miles distant, with buildings, corrals and good Mexican sheep for sale.

S. S., of Grassy Cove, Tennessee, has some table lands in East Tennessee (excellent for sheep), twelve miles from Cincinnati Railroad. Price \$1 per acre, or \$10 with improvements.

J. B., of New Jersey, has \$1,000 cash to put into the sheep business.

W. C., Cerro Gordo, California, wants a partner with \$3,000 to go into cattle and horse-raising business in the Big Horn and Yellowstone Country, Montana.

F. A. W., of Vergennes, Vt., wants to buy a good range in Colorado or Texas.

H. R., of Brooklyn, wants a partner to go to Colorado. Will put in \$3,000.

[We will furnish addresses to parties wishing to communicate.—Ed. F. and S.]

FOREST AND STREAM will be sent for fractions of a year as follows: Six months, \$2; three months, \$1. To clubs of two or more, \$3 per annum.

—We regret to learn that Mr. Jerome Marble, of Worcester, was knocked down by a horse on the 12th instant, while crossing Barclay street, and had two ribs broken. He has been confined ever since, but hopes to be able to return home this week.

PROFESSOR HAYDEN'S OPINION.—We have been much complimented by the following unsolicited letter from Professor Hayden, dated

U. S. GEOLOGICAL AND GEOGRAPHICAL SURVEY,
Washington, D. C., March 29.

Dear Mr. Hallock: I have read with care your "Sportsman's Gazette," and thank you most cordially for so interesting and instructive a work. It contains much information with which I was not previously familiar. Very sincerely yours,
F. V. HAYDEN.

THE RESOURCES OF TEXAS.—We call attention to our Texas letter, written by the author of that valuable new work advertised in our columns, entitled "The Coming Empire; or, Two Thousand Miles in Texas." We shall publish future letters from the same source, and we advise those who are interested in the development of the Lone Star State, or in grain and wool growing and cattle and sheep raising, to look out for them.

By the way, the Missouri, Kansas and Texas Railway Company publish a physical map of the State, showing the lumber, grain, sugar, cotton, grazing and mineral districts of the State, which we presume can be obtained by addressing their principal offices at New York, St. Louis and Sedalia, Missouri. It is extremely valuable to an intending settler.

GAME PROTECTION.

MEETINGS OF STATE ASSOCIATIONS FOR 1878.

New Hampshire State Sportsmen's League, Manchester, April.
New York State Association for the Protection of Fish and Game, Buffalo, May—; Sec'y., John B. Sags, Buffalo.
Connecticut State Sportsmen's Association, Hartford, May 15.
Iowa State Sportsmen's Association, Des Moines, May 28.
Nebraska State Sportsmen's Association, Fremont, May 21st and 22d.

National Sportsmen's Association, Wilkesbarre, Pa., June 11.
Illinois State Sportsmen's Association, Quincy, June 11.
The Pennsylvania State Association for the Protection of Game and Fish, Wilkesbarre, June 11; Sec'y., Benj. F. Downes.
Ohio State Sportsmen's Association, Cincinnati, June 15; Sec'y., Willbank, Toledo.

Tennessee State Sportsmen's Association, Nashville, Dec. 2; Sec'y., Clark Pritchett, Nashville, Tenn.
Wisconsin State Sportsmen's Association.
Massachusetts State Sportsmen's Association, at call of President.
Missouri State Sportsmen's Association.

A HOME FOR MESSINA QUAIL.—Apropos of the recent remarks on migratory quail which have appeared in these columns, our friend "Greenwood," of Greenwood Lake, writes as follows:

"I was very much interested in Judge Evert's letter and your editorial suggestions on the importance of the migratory quail, and sincerely hope some of our liberal-hearted (and pursued) sportsmen will take measures for their introduction to this country. And I will take this opportunity to state that, should any of your readers desire to make the experiment who do not possess suitable land and cover for the birds, I will willingly give the quail a home and all the attention and protection in my power here at Greenwood Lake, if it is not considered too near the sea-board for the experiment. They could have here the range of over two hundred acres of well situated game protected cover, on which unauthorized hunting is strictly prohibited, and they should receive intelligent care and attention, and every effort would be made to acclimatize and localize them, if possible. Of course, in making this offer, I should not lay any claim to the ownership of the birds, which would remain the property of, and subject to the disposal of, the party importing the birds, to whom every courtesy and facility would be extended, my object being merely to encourage the importation by tendering game protected cover for the experiment.

"Very few ducks as yet have been seen about the lake this spring and, no geese. No game in season, and musk-rats our only shooting."

SPORTSMEN'S PROTECTIVE CLUBS.—Our friends all over the country are sending us copies of their by-laws, etc., in response to our late appeal, and we are disbursing them as fast as they come; thus we are enabled to build up new clubs and extend the usefulness of protecting men and protective measures wherever game exists or can be made to abound.

The State Sportsmen's Association of Pennsylvania has recently elected the following officers: Robt. Dalzell, Pittsburg, Pres't; D. W. Seiler, Harrisburg, 1st Vice-Pres't; J. B. Reno, New Brighton, 2d Vice-Pres't; B. W. Richards, Phila., 3d Vice-Pres't; F. S. Blunt, Sharon, 4th Vice-Pres't; B. F. Dorrance, Wilkesbarre, Rec. Sec'y; A. M. Whisler, New Brighton, Cor. Sec'y; J. A. Harper, Pittsburg, Treas.; with strong committees on game laws and fish culture. This is a very strong organization, and is doing good.

The Fur, Fin and Feather Club, of Titusville, Pa., is a new organization with the following officers: J. H. Brownson, Pres't; H. Holladay, [Vice-Pres't; H. G. Davis, Sec'y and Treas.; H. T. Thompson, Game Constable; with an Executive Committee who mean business. The number of members is forty-six. Every protective club should have a game constable and pay him a good salary.

The officers elect of the Halifax, N. S., Game Protective Society are: Pres't, Robert Morrow, Esq., re-elected; Vice-Pres'ts, M. B. Daly and E. G. Stayner, re-elected; Council, C. M. Barry, Fitz Cochran, Louis P. Fairbanks, F. H. D. Veith, J. W. Jackson (New Glasgow), Hon. L. G. Power, Andrew King, Thomas Egan, Peter Jack, Andrew McKinlay, Lt.-Col. Clerke and Andrew Down; Treas., M. B. Almon, Esq.; Sec., Arthur E. Harrington, Esq.

—The Sportsman's Club of California now numbers 267 members. It was established two years ago by R. L. Ogden, Esq.

SCOTTSBURGH (N. Y.) SPORTSMAN'S ASSOCIATION.—This association, formed in August, 1877, now has a membership of forty, with the following officers: Pres., E. L. McFetridge; Vice-Pres., J. M. Slyker; Treasurer, Doc. D. H. Foster; Sec., B. F. Shepard. The club has done much for the protection of game, and by abstaining from shooting and by wintering several birds, have succeeded in materially increasing the stock of quail in the vicinity. They have also ordered brook trout for the streams, and are in other ways working for the increase of fish and game. E. L. McF.

—The waters of Oneida Lake are being depleted of fish by the flagrant violations of the fish laws. If the reports that reach us are correct, that game constable needs propping up, or propping out—one or the other.

PIGION SLAUGHTER.—Professor H. B. Roney, President of the East Saginaw Club, Michigan, stated in a recent address that from three nestings in Newaygo, Oceana, and Grand Traverse counties, in 1875, there were shipped to outside markets 1,000 tons, or 2,000,000 pounds of young "squabs," while not less than 200,000 dozen, or 2,400,000 live birds were entrapped and shipped to all parts of the United States and England.

The Rifle.

THE FOREST AND STREAM AND ROD AND GUN TOURNAMENT

For the Short-Range Championship.

On Monday night, the 18th March, at Mr. Conlin's gallery, No. 1,222 Broadway, New York, this very interesting event in rifle shooting, for prizes in the FOREST AND STREAM AND ROD AND GUN TOURNAMENT commenced under the following conditions: Teams—Each team shall consist of ten men. The teams participating must be composed of members of the various clubs which they represent. Rifles—Limited to ten pounds in weight; minimum pull of trigger, three pounds; 22-100 cal. Number of Shots—Ten by each competitor. Sighting Shots—Two shots will be allowed each competitor. Position—Off-hand. Targets—200-yards targets, according to the regulations of the N. R. A. reduced in proportion to the range at the gallery. The match to be governed by the rules of the N. R. A. relating to teams.

The following nine teams competed, having shot in the following order: Zettler and Yorkville Teams, on Monday, March 18th; Seppelfeldt and Newark Teams, Tuesday, 19th; Hellwig and Centennial Teams, Wednesday, 20th; Scotch-American Team, Thursday, 21st; and the New York and Irish-American Teams on Friday, 22d.

The prizes were: 1st—The FOREST AND STREAM AND ROD AND GUN badge; 2d—The Union Metallic Co.'s badge, presented by the Union Metallic Cartridge Co., of Bridgeport; 3d—The Shepard badge, presented by N. M. Shepard, Esq.; 4th—Ballard rifle, presented by Messrs. Schoverling & Daly; 5th—Revolver, gilt and pearl-handled, presented by the Messrs. Remington; 6th, 7th, 8th and 9th—A prize of \$2.50 in gold to the highest score in each team not winning one of the above prizes, given by Mr. J. Conlin.

It was optional with the third and fourth teams to select from the third, fourth and fifth prizes. The excitement in the many distinct rifle circles which abound in New York and the vicinity was very great, and quite as much practice was carried on and as careful inquiry was made into the shooting antecedents of the gentlemen who were to make up the teams as at any leading Creedmoor match. It is beginning to be very thoroughly understood that it is in gallery practice that experts are fashioned, and that when good scores are made in a 100-feet gallery, it is quite certain that any one thus creditably acquitting himself will be pretty sure to roll up a handsome total at Creedmoor. In fact, some of our most expert marksmen are quite ready to insist that it is even more difficult to plant successive balls in the 13-inch bull's-eye in the rifle gallery than at the larger target in the field. Though gallery practice under inclosure may prevent effects of wind and atmospheric disturbances, still some of the conditions as to light, though fixed, are not as favorable as in the open air. Nevertheless, those who shoot, as it is said before, with skill in a gallery, are sure to lead in open-air contests.

One most important feature of this team practice, which the FOREST AND STREAM AND ROD AND GUN has been endeavoring for some time to present, is the contrasting of the skill of our German friends with those of our native-born citizens. The rifle tournament which has just been so pleasantly terminated, we are pleased to state, has brought into competition exactly both these elements. Representative German and American riflemen met at Conlin's Gallery, and the victory was gallantly won by the Zettler team, the New York team being second, though the question of supremacy may not yet be settled. Still, just such trials must have the excellent effect of stimulating our riflemen to further efforts, which can only increase the good will and fellowship which must exist between riflemen of all nationalities. We had hoped that a team of Swiss riflemen, well known for their skill, would have entered the list, but we were disappointed. We trust, however, that at the coming Schuetzenfest, on June 24 of this year, where we have offered a handsome prize, there will be found, facing the targets, teams composed of Germans, Swiss and Americans. Our own pride in American riflemen can be in no way hurt by their having been beaten for the first place in this team match, as the victors, the Zettler Club, are composed of veterans who are thoroughly familiar with the rifle, and who were the winners of the prize offered by us in January last at the Union Hill Schuetzen Park.

On Monday night the rifle gallery was crowded by the lead.

ing riflemen, but, thanks to Mr. Conlin's good management and thorough system, the matches were continued every night without stop, hindrance or dispute. The method of marking was as thorough and complete as possible, a duplicate target having always been made and kept, which recorded each shot, which duplicate target was attached to the real target. All the targets were placed under the charge of T. C. Banks, Esq., of the FOREST AND STREAM AND ROD AND GUN, and were every day placed in the custody of one of the editors of the paper, when they were sealed up, to be afterward opened by the judges, Col. G. W. Wingate and Major Henry Fulton, in the presence of the referee, Mr. T. C. Banks. We now give the scores of the teams in order of merit:

Zettler's Team—Capt M L Riggs.									
T Kleisrath	4	5	4	4	4	3	5	4	43
M Dorrier	4	4	5	4	4	4	5	5	45

Yorkville Team—Capt M F Ratty.									
A Smart	0	4	4	4	4	3	2	4	30
J Pandling	4	4	4	4	4	4	4	4	45
P Mc Morrow	4	4	4	4	4	4	4	4	41
G See	5	4	4	4	4	4	4	4	45
T Woods	4	4	4	4	4	4	4	4	39
F Kasse	4	4	4	4	4	4	4	4	44
E Gelfas	4	4	4	4	4	4	4	4	39
J R Grohman	5	4	4	4	4	4	4	4	45
O Keltz	4	4	4	4	4	4	4	4	45
Capt M F Ratty	4	4	4	4	4	4	4	4	45-419

The following is the resume of the match:

Zettler	454	Seppenfelts	427
New York	448	Centennial	423
Hellwig	432	Irish-American	420
Scotch-American	431	Yorkville	419
Newark	423		

Awards for individual highest scores: Mr. A. Keller, Seppenfelts, 47; Mr. J. D. Redpath, Centennials, 49; Mr. J. J. C. Clark, Irish-American, 46; O. Keltz, Yorkvilles, 45.

It may be stated that in judging the targets, Col. Wingate and Maj. Fulton were never at variance, and in no case was it necessary to call on the judgment of Mr. T. C. Banks, the referee. Of course that certain peculiar accident, which always does turn up when least expected, actually did take place. When the fourth man on the New York team was shooting, the main-spring of the rifle snapped and another spring had to be substituted. This change made the rifle a very much heavier pull, which might have disconcerted the shooters. As it was, however, this bit of real bad luck also effected the Irish-American team, who used the same rifle. The FOREST AND STREAM AND ROD AND GUN take particular pleasure in returning their thanks to Mr. Conlin for the great attention he has given to this match, and are glad to express the obligations they feel to the Union Metallic Cartridge Co. of Bridgeport, to Messrs. Schoverling & Daly, to the Messrs. Remington, and to N. M. Shepard, Esq., for the handsome prizes contributed by them.

Saturday evening the courtesy of the Sturtevant House having been extended to them by the proprietors, the Messrs. Lelands, the members of the competing teams, with a number of other gentlemen, gathered for the distribution of the prizes, Col. Schermerhorn presiding, Mr. J. N. Meeker, of the New York Club, secretary. The FOREST AND STREAM AND ROD AND GUN medal was presented by Mr. Banks, and received with a few well-chosen and modest words by Mr. Sherman, of the Zettler Club. Mr. Sherman in his expression of the good feeling and generous rivalry existing between the Zettler Club and their competitors, gave the keynote to the tone of the whole meeting, which was boisterously reiterated in the rousing cheers which followed the reception of each award. Dr. Dudley, of the New York Club, received the Union Metallic Cartridge Co. medal with a neat speech. Major Fulton, with a few remarks, urging that to be a successful rifleman it is first necessary to be a man with manly attributes well developed and enervating influences suppressed, then presented to Mr. Hellwig, of the Hellwig Club, the third prize. Mr. Bruce, on behalf of the Scottish-American team, received the prize awarded to that club. The Newark team were conspicuous for their absence, Mr. Conlin humorously explaining that the news of their victory had not yet reached Jersey. Their prize was accordingly entrusted to the keeping of this journal and has since been received by that club. Of those who had won individual honors, only Mr. Keller, of the Seppenfelts team, was present to accept his award with becoming modesty. A series of votes of thanks then followed, in which recognition was made of Mr. Conlin's courteous conduct of the gallery during the match, and also of the proprietor of the Sturtevant House, the very satisfactory labors of the judges, and the generosity of the donors of the prizes.

NEW HAVEN RIFLE ASSOCIATION.—The regular monthly meeting of the New Haven Rifle Association for competition will be held at Quinnipiac range, Wednesday, April 3. The annual meeting of the association for the election of officers will be held at the office of Col. S. R. Smith, No. 347 State street, at 7:30 o'clock on Friday evening, April 5.

—Mr. Conlin's prize shooting match will close this week. There are a few prizes still left, for which tickets may be procured. There are forty prizes, but no one can win but one prize.

SEPPENFELT RIFLE CLUB, 104 Bowery—Friday, March 22.—175 feet, off-hand; bull's-eye, 2½ inches; Creedmoor target, possible 50.

A Gruneberg	47	G Strassner	43
John W Adams	45	Alb Keller	43

CR. SHACKELL, Sec.

THE SHARPshooters' UNION.—The extra prize list of the Sharpshooters' Union is filling up to very attractive dimensions. In addition to the donations already noted in the FOREST AND STREAM of last week, the Columbia Rifle Association have given a gold watch, valued at \$75; Gus Lauter, of the same association, a Ballard rifle, valued at \$50; the Independent Schutzen Corps, a watch, value \$300; John F. Rodman, five barrels of old ale, value \$100; H. D. Busch, a breech loading rifle, value \$100; August Emmisch, 500 cigars, valued at \$50, and the Jersey Schutzen Corps, \$150 cash.

HACKENSACK RIFLE ASSOCIATION.—Monthly meeting for diamond badge, March 22; short-range:

B S Earle	3	5	4	4	4	4	4	4	35
A H Banta	3	4	4	4	4	4	4	4	31

MAYNARD RIFLE CLUB AND THE MAYNARD RIFLE.—With your permission I would like to give your readers some account of the performance of the Maynard rifle, manufactured by the Massachusetts Arms Co., which has come under my own observation. Last September we organized a long-range rifle club, under the name of the Wheeling Rifle Club. We experimented with Remington, Sharps and Ballard rifles. Nearly every member thought of no other rifle but Sharps or Remington for long-range shooting, and when I ordered the first Creedmoor rifle which ever came to this State, and it was seen to be a Maynard, I was asked by every one: "Why did you get that? I never heard of it." My only reply was, I had used one and become attached to it. In my practice at 800 yards, on our range on Nov. 7, 1877, I made sixteen bull's-eyes out of twenty shots, scoring 96 in a possible 100. One week later, on the same range, in thirty successive shots I got twenty-eight bull's-eyes, making a score of 143 in a possible 150. This, I believe, is better work than was done by either of the sixteen men shooting in the last international match. I have seen ten successive shots at 1,000 yards grouped into a space of less than one-fourth of the area of the bull's-eye. It has also made a string of eight inches at 220 yards with ordinary sights. Mr. H. W. S. Cleveland, of Chicago, who is recognized as a good authority on rifles, I suppose, has written a letter of several large pages to a gentleman here, which is mainly devoted to giving his experience of the Maynard rifle. He speaks of using a .40-cal., 20-in. barrel, for off-hand shooting, and says he has penetrated seventeen inches of white cedar with it. Also, in speaking of its accuracy he relates firing three shots at 1,000 yards, in which a 3, a 4 and a 5 was scored with this rifle, which is not intended for use at over 500 yards. He mentions also that a string of ten bull's-eyes at 200 yards is not unusual with it. Major Henry Fulton, who had never used the Maynard until last fall, told me that he had fired ten successive shots at 800 yards with a Maynard Creedmoor, which were grouped so closely in the bull's-eye that he could cover them with the palm of his hand. (He is not supposed to have a larger hand than other persons.) Our club, after seeing how very accurate

a shooter the Maynard was, changed its name, and now we propose to shoot under the name of the Maynard Rifle Club of Wheeling. The Ballard rifle was sent here after our organization, and public trials of it were made, but no good was ever done here with it, and no rifles were sold. In off-hand practice I have fired five successive shots, with .40-cal. barrel, at 100 yards, into a four-luch bull's-eye, and scored 46 on two occasions with it at that distance, in ten shots, after forty shots had been fired without cleaning. My great admiration for the Maynard, and my desire to see it given a fair show, has induced me to write the above; and as the Maynard Creedmoor is only something over a year old I hope to see it make a name during the next summer, and put itself into the popular accepted list of first-class rifles.

Wheeling, W. Va.

CHAS. E. DWIGHT.

MAYNARD RIFLE CLUB—Wheeling, W. Va., March 18, 1878.—The following scores were made last week in a regular competition for the "off-hand" team of the M. R. C.

McVay	4	5	4	4	4	4	4	4	3-42
Stanton	4	4	4	4	4	4	4	4	42
Carroll	4	4	4	4	4	4	4	4	42
Dwight	4	4	4	4	4	4	4	4	41
Worthen	4	5	3	4	3	4	4	4	39

Average 41 1-5.

MINNESOTA—Minneapolis, March 21.—The rifle club at Minneapolis made the following handsome score at 500 yards. Wind strong, blowing from the right:

Hobbit	5	5	4	5	4	3	5	5	2-41
Quam	4	5	4	4	5	5	5	5	49
Libby	3	5	5	5	5	5	5	5	42
Slotten	5	5	4	5	5	5	5	5	49
Westcott	4	3	5	4	4	4	4	5	40

Mr. Slotten's score, 49 out of a 50, is a remarkable score.

UTAH RIFLE ASSOCIATION.—At an adjourned meeting of the Utah Rifle Association, held at Salt Lake City, March 14, the following business was transacted:

The committee reported the by-laws of the Association, in the hands of the printers, would be in readiness for distribution in the course of a few days. The finance committee, consisting of Messrs. John and James Sharp and John Groeschek, was empowered as a special committee to secure prizes for competition at the spring meeting of the association. G. A. Mears and John Sharp were appointed a committee to designate some one person to represent the association at

"PERRY'S GREEN-BOOK" FOR RIFLEMEN.—The great success Mr. Perry has achieved with his improved system of score book for the use of riflemen, with the silicate plate added, has induced him to publish a second edition. The best commendation of the "Perry Green-book" is that the majority of the marksmen use it. The book is considerably improved over the first edition, some suggestions of Sir Henry Halford's having been adopted. We can recommend Perry's score book, from personal experience, as being the most handy score book we know of.

AN AUXILIARY RIFLE.—How to convert a shot-gun into a rifle is a problem which has long sought a solution. Whether to carry into the field a shot-gun or a rifle, so as to be prepared for any kind of game, is a question often asked. Now if some method could be devised, some plan of simple arrangement, when, in a few seconds, the barrel of a shot-gun could be turned into a rifle, such an arrangement would be pretty certain to fill a very much required want. That such a plan has been hit upon, there can be no doubt. By means of the auxiliary barrel, in a few seconds of time, just as readily as a shell can be placed in the chamber of a breech-loader, a rifle tube can be inserted into the barrel of the gun, and a capital rifle is at the disposal of the sportsman. There are no screws to fix, no nuts to fix into place, no delicate adjustment to be made. All you do, as has been stated, is to chamber your rifle barrel in your gun, and that is the end of it. A rifle barrel can be put in the gun and taken out in certainly twenty seconds. It must be remembered that the Auxiliary Rifle is no pop-gun. It can be furnished by the manufacturers of calibres, that would be efficacious for all kinds of four-footed game. There can be no wear nor strain on the gun barrel, as the whole method of fitting the rifle into the gun rests on the same principle as in the introduction of a metallic shell. Particular attention is called to the advertisement.

UPSET OF BULLETS.

EDITOR FOREST AND STREAM:

In response to Major Fultou's query—"If the bullet is upset enough to fill the grooves at once, how can it be shortened still more?"—please allow me to say that the bearing surface of a bullet is from one-third to two-thirds its length; the balance of the bullet is tapering more or less. This bearing surface fills the grooves at the beginning of the force; whatever shortening, if any, takes place after that, must be derived from the compressibility of the metal and the taper of the bullet. Yours, hastily,

F. HYDE.

The Game of Chess.

3—Q mates 2—Any

The following games are further translations of the Vienna Opening as found in the *Handbuch*:

Game No. 32.—VIENNA OPENING.

The first two moves are the same as in the preceding game:
White. Black. White. Black.
1—P-K4 1—P-K4 7—P-Q B3 7—B-Q B4
2—Kt-Q B3 2—Kt-K B3 8—Kt-Kt3 8—B-K7
3—Kt-K B3 3—B-Q Kt5 (a) 9—P tka B P 9—Kt P tka P
4—Kt-Q B3 4—Kt tka Kt 1—P-Q3 10—P tka Q P
5—P tks Kt 5—P-K5 Even game.
6—Kt-Q4 6—P-Q B3

NOTES.

(a) If 3—Kt-Q B3, then 4—B-Q B4, 4—B Q K4, and the opening is the same as in the Two Knights' Defence. If 4—P-K B4 (7), 4—P tks B P, and we have an irregular defence to the King Knight's Counter Gambit.
(b) Also, 4—Kt-K5, 4—Q K2; 5—P-K B4, 6—P-Q3; 6—Kt-K B3, 6—B tks Q Kt; 7—Q P tks B, 7—Kt tka K P; 8—B-K2, 8—Castles; 9—Castles, obtaining, however, no advantage.

Game No. 33.—VIENNA OPENING.

The first two moves are the same as in the preceding game:

White. Black. White. Black.
3—B-Q B4 3—Kt tks K P? (a) 6—P-Q4 6—Kt tks P
4—B tka P ch 4—K tks B 7—Kt-K B3 White has the best game.
5—Kt tks Kt 5—Kt-Q B3

NOTES.

(a) If 3—B-Q B4; 4—Kt-K B3, or if 4—P Q3, or 4—P-K B4, we have variations previously published. If 3—P-Q K4?; 4—B tks P, 4—P-Q

B3, which appeared in the *Vienna Zeitung*, 1855, p. 188, White plays 5—B-Q R4 or B K3. This Evans' Gambit by the second player, is weak.

Game No. 34.—VIENNA OPENING.

The first two moves are the same as in Game No. 32:

White. Black. White. Black.
3—P-K B4 3—P-Q1 11—Castles Q R 11—B tks Q Kt
4—P tka Q P 4—P-K5 (a) 12—Q tks B 12—B tks B
5—P-Q3 5—B-Q Kt5 13—Q K-K 13—Q-K4
6—P tks K P 6—Kt tks K P 14—Kt tks B 14—Q tka Q P
7—Q-Q4 7—Q-Q2 15—Q tka Q B P 15—Q tka K Kt P
8—B-K3 8—Castles 16—K R-K Kt 16—Q-Q B3
9—B-Q2 9—Kt tks B The game is even.
10—Q tks Kt 10—B-K Kt5

NOTES.

(a) This variation is taken from the notes in the *Schach Zeitung*, 1860, p. 68, to a game between Hampe and Pitschell. The game may also be equalized as follows: 4—Kt tks Q P; 5—Kt tks Kt, 5—Q tka Kt; 6—P tka P, 6—Kt-Q B3; 7—Kt-K B3, 7—B-K Kt5; 8—B-K2, 8—Kt tks K P.

Game No. 35.—VIENNA OPENING.

The following game is identical with the move in Game No. 34 to the 4th move:

White. Black. White. Black.
4—P tks KP 4—Kt tks K P 7—Kt P tks Kt 7—Kt-Q B3
5—Kt-K B3 5—B-K Kt5 (a) 8—P-Q4 8—K B3
6—P-Q3 6—Kt tks Kt The game is even.

NOTES.

(a) The defence can also continue here by: 5—B-K Kt4; 6—Q-K2, 6—B tks Kt; 7—Q P tks B, 7—Castles, and Black possibly has the advantage, which, however, Lowenthal, 1867, p. 7, doubts.

SPECIAL NOTICE.

We also commence this week the publication of variations from the *Handbuch* in the PETROFF DEFENCE, and it is our intention to add still another opening from this incomparable chess work next week. These variations are well worth preserving as a reference.

Game No. 36.—PETROFF DEFENCE.

This game is also translated from the *Handbuch*:

White. Black. White. Black.
1—P-K4 1—P-K4 8—B-K3 8—P-Q5
2—Kt-K B3 2—Kt-K B3 9—B-K B4 9—P-Q6
3—P-Q4 3—Kt tka K P (a) 10—B-K3 10—B tks B
4—B-Q3 4—P-Q4 11—P tks B 11—B-Q R3
5—P tks Q P (b) 5—Kt-Q B3 12—Kt-Q2 12—Q-Q4
6—B-Q Kt5 (c) 6—B-Q B4 Black has the best game.
7—B tka Kt ch 7—P tks Kt

NOTES.

(a) It appears less advantageous to take P with; and if 4—P K5, then 4—Kt-K5; 5—Q-K2, 5—B-Q Kt5 ch; 6—K-Q, 6—P-Q5; 7—P tks P, 7—P-K B4; 8—P tks P, 8—Q tka P; 9—Kt tks P.
(b) If White capture 5—Kt tka P, then Black continues with: 5—P-Q B4; 6—P tka P, 6—Kt tka P.
(c) Or 6—Castles, 6—B-K B4; 7—P-Q B4, 7—B-K3, and the game is even.

Game No. 37.—KNIGHT'S DEFENCE.

Between the Globe Chess Club, of Boston, and the Newton Chess Association, at the room of the G. C. C., March 6, 1878:

A NEW CHESS BOARD.—Mr. F. E. Brenzinger, No. 53 Chambers st., New York, has just introduced a new pocket chess board. We unhesitatingly recommend it as the best article for the price (\$1.25) in the market.

Rational Pastimes.

SNOW SHOE CLUBS.—The pastime of snow shoeing is a favorite sport among our Canadian cousins. For some reason, whether it be that from our want of familiarity with it we do not appreciate this invigorating and health-giving sport, or that the snow, which is as necessary for snow-shoe tramps as Hamlet, etc., is an uncertain factor in our calculations, we have paid little or no attention to it in this country. This is to be regretted, because the list of our winter out-of-door recreations is too limited, and when the snow comes it coops us up in the house instead of inviting us to cheery tramps over the hills. The following account of the Cornwall, P. Q., Snow-Shoe Club will show how they do it in Canada.

Accompanying the letter is a photograph of the club at one of their winter rendezvous. The Canadian scenery, trees beading beneath their weight of snow, cottages half hidden in their fleecy covering, and the members of the club in picturesque costume, combine to make a most pleasing picture.

Our columns are ever open for the presentation of any pastime giving health and manly development. We share the hope of our correspondent that we may some day be able to devote a space in this journal to the pleasures of the snow fields.

The Cornwall Snow-Shoe Club was organized in the winter of 1876-77, with a roll of fifty members. At present we are increased to nearly double that number, most of whom join in the weekly tramps. These tramps extend to distances varying from four to fifteen miles and return, depending a great deal on the condition of the snow and weather. The costume of the club consists of a steel-gray blanket coat, unlined, scarlet sash, blue trowsers and stockings, which combine to present a very pretty picture, as the members step off in Indian file over the crisp, frozen snow, under a bright midwinter moon, across fields; through the woods, jumping fences, leaping ditches, and scrambling through farm yards,

intent on making a "bee-line" for the desired destination. Many a song, with full chorus, enlivens our tramps, echoing over the hillside and startling the sleepy cottager, as snatches of the music, weird and mysterious, are borne upon the frosty air. The present winter has not been a favorable one for snow-shoeing. However, the club has given several concerts in the neighboring villages, which passed off very pleasantly and successfully.

Snow-shoeing, as a pastime, seems to be almost entirely a Canadian institution. We would be happy to hear that some of our American cousins, who live in the northern latitudes, would follow our example and organize snow-shoe clubs. We enjoy the fun; why should not you? I hope to see, at not a far distant date, a small corner of the FOREST AND STREAM devoted to snow-shoeing.

G. H. W.

O'LEARY WINS THE RACE.—Another triumph is scored for American pedestrianism by the feat which O'Leary has just accomplished at the international walking match in London. The telegraph kept us on this side fully informed of the progress of the contest, and America's chances for the prize formed the theme of conversation in athletic circles. The Irish-American champion had a long and a hard walk for that purse, and we wish him all possible enjoyment of his reward.

The contest began on Monday at 1 o'clock A. M. At the end of 24 hours the contest was practically between the four following competitors:

	O'Leary.	Vaughan.	Brown.	Corkey.
Tuesday, 3 P. M.	160	168	168	169
Wed., 11 A. M.	231	222	224	disqualified.
Thurs., " "	318	307	298	
" 12 P. M.	373	359	387	
Friday, " "	457	441	418½	
Sat., " "	490	469	443	
" 1 " "	493	470	447	
" 2 " "	497	473	447	
" 3 " "	501	475	452	
" 4 " "	505	483	454	
" 5 " "	508	487	463	
" 6 " "	512	493	468	
" 7 " "	510	497	472	

Vaughan completed 500 miles at 7:38 o'clock and then retired. O'Leary walked until 8:10 o'clock, when he had completed 520 miles and two laps, which is 440 yards further than the best performance on record. Brown walked till 8:30 o'clock, scoring 477 miles and two laps. He also walked till 8:30, scoring 405 and four laps. O'Leary was then declared winner amid the playing of national airs and boundless excitement and enthusiasm.

HARLEM ATHLETIC CLUB.—At the annual meeting of the H. A. C., last Thursday evening, the following officers were elected: President, J. D. Rihlet; Vice-President, C. W. Horton; Recording Secretary, W. I. K. Kendrick; Corresponding Secretary, J. S. Nelson; Treasurer, E. W. Molson; Captain, R. Morgan; First Lieutenant, T. H. Armstrong; Second Lieutenant, F. J. Mott; Trustees, J. B. Arnold, W. H. See, Jr., T. B. Bates, E. C. Kuster, F. Henshaw and W. M. Nelson. The report of the captain of the club shows that 113 medals had been won by members of the club during the past year, sixty-one of which were for first honors. The entertainment to the ladies will be given on April 9. A children's class will be formed, to meet on Wednesdays and Saturdays for instruction in calisthenic exercises, for which a fee of fifty cents a month will be charged.

NEW YORK ATHLETIC CLUB.—The opening athletic games of the season will take place on the grounds of the New York Athletic Club, Mott Haven, on Saturday, April 6, at five o'clock P. M. Entries will close on April 2, and must be addressed to William R. Whitmore, Secretary, box 3, 101 New York Post Office.

CRICKET.—The grand match at cricket between the Australian team—now en route for San Francisco—and the Middlesex Eleven, of London, is announced to take place at Lords on June 20. They will have to close up all their American games by the first week in May, as they are engaged to play in Nottingham on May 20.

—The entries for the N. Y. A. C. games, April 6, close April 2. The secretary's address is Wm. R. Whitmore, P. O. Box 3101.

—Christopher Rice, at Rutland, Vt., the other day walked 50 miles in 9h. 16m. 22s.

Sea and River Fishing.

FISH IN SEASON IN MARCH.

SOUTHERN WATERS.

Pompano, *Trachinotus carolinus*. Grouper, *Epinephelus nigritus*.
Drum (two species). Family *Sciaenidae*. Trout (black bass), *Centropomus*
undatus.
Kingfish, *Menticirrhus nebulosus*. Striped Bass, or Rockfish, *Morone*
sea bass, *Sciaenops ocellatus*. *lineatus*.
Sheepshead, *Archosargus probato-* Tailorfish, *Pomatomus saltatrix*.
cephalus. Black Bass, *Microporus salmoides*.
Snapper, *Lutjanus caesus*. *M. nigricans*.

—The trout season on Long Island, which opened last year, and previously on the 15th of March, does not open this year until the 1st of April. The law is now uniform throughout the State.

"Deacon Jones, we will go a fishing, allent and circumspect, and no running to the beat notes,"—Professor Williams.

The season has arrived when the angler feels the first symptoms of the trout fever, a disease that gains strength with the warm weather and almost incapacitates him for work. Unerring signs are the overhauling of flies and rods; putting the latter together and exercising it to the great danger of fragile objects within reach; the haunting of fishing tackle shops and there discoursing upon previous experiences and exploits. There is no cure known but for the patient to go as soon as the law allows to some cool stream and there wade, whip and exult. This early spring weather has brought on the "fever" very suddenly, and with great severity. The robins are singing away on the bare apple trees; bluebirds are building, frogs are croaking, snipe are rising over the meadows and marshes, and ahad are in the rivers. As soon as the 1st

of April comes the streams will have to suffer and be thrashed. Some few graceless poachers have already snaked off before their more honest brethren and are bragging of the trout they have caught, but public sentiment has changed very much lately, and now gentlemen do not do such things.

It is to be regretted that there is so little free trout fishing near New York. To be sure there are plenty of places where anglers can buy trout for \$1 per pound with the privilege of catching them, but it is expensive and not satisfactory. They do say though, that some celebrated anglers in New York will allow themselves to be tempted into buying a big trout or two, just to fill up the creel and improve the appearance of their catch; but that may be one of those Long Island stories. There were once a good many streams not far from the city where a good angler could have fair fishing, but the wretched habit of keeping all the fingerlings for the basket has depleted them, and the trout are so scarce that it is not worth while to go after them.

June will now soon be upon us, and then we will have the cream of the sport. Nothing can equal a lovely June day on a pleasant trout stream. The woods are fragrant with the wild grape, the ground studded with violets and hundreds of different wild flowers, the banks lined with the beautiful laurel in full blossom, and the wood-robin, the sweetest of our song birds, can be heard in every direction. Fortunate is the man who knows of such pleasant places and can enjoy them. Imagine yourself there some quiet afternoon, with pipe alight and a fresh leader and cast of flies just put on. You see ahead of you your favorite pool, and here and there a dimple on the waters that makes your fingers tingle, for you know that the big trout are there. Cautiously you approach, step by step, and at last drop your coachman like a flake of snow, just where it ought to go. There is a bulge in the water and you strike. Wizz! goes the reel. The pliant rod does its duty, and after a few moments the speckled beauty is in your net. So you go on until the sun is down and the whippoorwill takes the place of the wood-robin. Then you trudge back to your tavern, after a good day's sport, a happy and contented man.

W. H.

FISH IN MARKET—RETAIL PRICES.—About three hundred shad have been taken in the North River the past week. Our quotations are as follows: Striped bass, 20 cents; large do., 15; smelts, 15; 20; frozen salmon, 35; green do., \$1.25; California 40; mackerel, large, 25; mackerel, small, 10; Southern shad, 60; native, \$1; white perch, 15; Spanish mackerel, 35; green turtle, 15; Terrapin, \$18; frost fish, 8; halibut, 12; haddock, 6; codfish, heads off, 8; black-fish, 15; Newfoundland herring, 6; flounders, 10; do., small, 6; eels, 18; lobsters, live, 8; do., boiled, 10; sheepheads, 20; turbot, 25; scallops, \$1.50 per gallon; soft clams, per 100, 80; do., large, 60; whitefish, 15; salmon trout, 10.

MASSACHUSETTS—Lynnfield.—Humphries' Pond, at Lynnfield, is closed for ten years, under lease to private parties, who intend to stock it with all the varieties of good food fishes they can procure. Humphries' Pond, or Suntaug Lake, is one of the finest sheets of water in the State, and, we believe, the only one over the regulated size that is owned entirely under riparian rights. Of late years trespassing during the summer months has become an unbearable nuisance, and fishing good only in name, so that the owners have leased the pond, and it is now closed for all purposes except by special permit from lessees.

C. T. J.

New Bedford, March 23.—In this vicinity the spring fishing season is at least one month earlier than usual; large quantities of alewives, perch, bass, cod, etc., are now taken in our waters. I never saw fish sold at so low a price at this time of year.

COSCHA.

MOVEMENTS OF THE FISHING FLEET.—The past week the whole number of arrivals reported are 23, against 41 the previous week and 65 the week before that. The receipts of fresh halibut for the week have been 430,000 lbs. The Georges vessels brought in 350,000 lbs. round codfish.—*Cape Ann Advertiser, March 22.*

TENNESSEE—Nashville, March 21.—For the past week the weather has been most favorable for fishing, and great numbers of persons have been out to all the different streams in the immediate vicinity. The best takes have been in Mill Creek by a gentleman who is generally successful. One afternoon he brought home five nice trout (bass), and the next time eight, one or two of the latter scaling one and a half pounds. Several parties have left town for the Harpeth River. A large number of shad have been on the market here during the last week.

J. D. H.

Savannah, March 1.—In this vicinity our fishing season is commencing early this spring. One morning last week I took four bass and several perch and bream. We were very much annoyed by hell-benders, called here water dogs. They were out in force, and we caught two that would weigh at least 4 pounds each. The mud turtles and mooseasins were also swimming around, and the former took some stock in our minnows. It is very unusual to see snakes, turtles and water dogs at this season.

WILL.

NOTES FROM FLORIDA—Halifax Inlet, March 15.—Jean Ribault, who visited the mouth of the St. John in 1562, says that the fish were there so plenty that "ye can take them without net or angle, as many as ye will." Two hundred years later Capt. Bernard Rowans, an English engineer who surveyed this coast, writes of the fishes of the Indian River, that "they so abound that a person may sit on the bank and kill them with a stick." A Mr. Vans, who lives on the Musquito lagoon, says that when he wants fish to feed his hogs he goes to a shallow part of the lagoon with a hoe, and brings out as many drums as he wants, just as a Northern farmer would resort to his potato field. I myself, lately saw a boy at this Inlet kill two large salt water trout with a stick, they were in a shallow slough where they had been left by the falling tide; they weighed five or six pounds each. Pacetti went there soon after with his cast net, and with three or four casts he

got enough trout, bass and mullet, to nearly load our boat; he, however, is so skillful with that implement as to almost equal the Arab fisherman Nasrollak, of whom Southey writes, that if he threw his net upon the sand of the desert he was sure of catching fish. With all this abundance, the hook fishing in these rivers has been for the last four or five weeks very poor. No fish have been taken abundantly except sheephead, and of that kind of sport one gets tired when fifty of them can be taken in one tide.

The people at the head of the Halifax River are attempting to open a new inlet to the ocean, near Bulow's Creek, the object being to let out the great volume of fresh water from the Tomoka, which has caused much sickness this year as well as killing the oysters and driving away the sea fish. This is a large enterprise for so poor and thinly settled a country. At the last accounts Jacksonville and St. Augustine were crowded with visitors, and all the Florida resorts were filling up after being empty since the beginning of the season. Loud's Ocean House at New Smyrna is full of hunters and anglers, the latter of whom have to subsist on faith and hope for the present; that is, the old hands, whose principal object of pursuit, the red bass, is very scarce—the new comers, who are satisfied with sheephead fishing, can have sport enough. S. C. C.

WISCONSIN—Ashland, March 16.—Fred Peterson and Peter Anderson caught one hundred and eighty pounds of herring Wednesday forenoon, hook and line fishing.

CALIFORNIA—San Francisco, March 17.—The Sacramento, Russian and American rivers are full of salmon, salmon trout, and trout, and will afford anglers and sportsmen plenty of sport this season. They are very large.

"Come, come, my son, get up. The early bird catches the worm."

"All right, dad; you catch the worms and I'll go a-fishing."

BEAUTIFUL FLY RODS.—Years ago we used to delight in the privilege of entry to the little private workshop of the lamented Thad Norris, Esq. We should more properly speak of his quarters as an atelier, or studio, for he was not a mechanic by trade, and the word sounds more *distingue*, as the Frenchmen say. In his early efforts at rod-making, our friend Norris filled in his leisure moments by planing, sawing, serving and varnishing his not very excellent rods, pausing betimes for a pull at his cob pipe, or to chat with some chance visitor, until at last, after many months, his daily practice made him nearly perfect, and his rods came to be beautiful and much sought for by brother anglers, particularly by those who had the good fortune to be numbered among his friends. The demands grew so that he was unable to fill them, and a market having thus sprung up, the value of his rods was enhanced. He put a big price on them, and thenceforward, for several years, his business was sufficiently remunerative to keep him supplied with pocket change and tips to the contribution box on Sundays. But, finally, time grizzled his locks, and the good-natured dimples on his physiognomy deepened into furrows; his handiwork became less complete through that unsteadiness which the accumulation of years imposes upon the nerves, and then the few rods that he occasionally made were purchased more as *souvenirs*, so that he who is now so fortunate as to possess one of them, exhibits it with a fervor that does not attach to a contemplation of ordinary shop goods. William O. Prime, Harry Venning, of St. John, Walter Brackett, and other well-known gentlemen anglers, speak in the highest terms of the Norris rods which they own, and can hardly be induced to admit that there are any superior to them. No doubt veneration for the maker engrafs a quality upon them. Good old Norris! Many scores of friends lament his untimely taking off. Our retrospection has been naturally awakened by the visit of a resident of Utica, Mr. H. P. Buckingham, who has shown us a most exquisite eight-strip split bamboo rod of his own make. It is a beauty to the eye and confiding to the hand. Last year we saw three of his rods; but this one is so incomparably superior that it reflects much credit upon his study and perseverance during the intervening months. Mr. Buckingham is as strictly an amateur rod-maker, as Mr. Norris was. His success has induced him to manufacture for the market, and he places his price at \$30 per rod. Of course he can make but a limited number, and he will not be strictly a competitor to the trade. Those who have any curiosity to inquire farther will be served with desired information by addressing him.

BOSTON AND VICINITY.—The South Boston Yacht Club holds its annual dinner April 10. The club has recently received several new members and several new yachts. The *Boston Herald*, which offers a cup for competition among six-oared amateur crews, speaking of yachting and boating, says: "The Addie Elmer, lately purchased by Mr. Robert Kidd, and now undergoing extensive alterations, will be added to the South Boston Club. Mr. Howard P. Elwell, of Gloucester, a new accession to the club, has nearly completed a very handsome 24-foot centre-board cat-rig yacht, which will make her appearance in the regattas the coming season. Captain Woodward is making numerous alterations in the Ivy, a much needed one being the setting of the mast some four feet aft. Mr. Seavy, who has lately joined the club, will swell the fleet by the addition of a 20-foot ketch cat-

rig. The annual Fast Day regatta of the mosquito fleet will be sailed April 11, and already the hammer, brush and putty knife are being applied to the tiny craft.

"Probably no city in the country can produce as many fine pair-oared crews as Boston, among whom are Faulkner-Reagan, Gookin Brothers, Connolly Brothers, and McGabey and Henry. Mahoney is as yet undecided whether he will row pair; but, with such a mate as Biglin or Plaisted, the two would make a strong team. In the four-oared working boat class, the Lakeman crew will, without doubt, maintain its position of last year, ranking first, though this is by no means certain, should the Shawmut crew secure a good man with Mahoney and Gookin Brothers. The Riverside and City Point crews have fallen off, especially the latter, which now ranks about medium. Both will be represented at Silver Lake. The Lynn, Casey, Atlantic, East Boston, Charlestown, and other minor crews, may also enter in the coming regattas. At present there is no professional four-oared crew in this vicinity, but there is excellent material for several such crews. In single-scutt open boats a number of new comers are to enter the lists for prizes, and a fine contest may be looked for among this class of scullers."

—The officers of the Young Men's Christian Association Rowing Club are arranging for building a new boat-house. Four new hydraulic rowing machines have been added to the gymnasium.

—The Water Lily, a South Boston 19-foot open yacht, which left that city about Jan 1, on a cruise eastward, has just been heard from as having reached Mount Desert. Her crew consisted of two men, and the successful cruise of such a craft in such waters, and in such a season of the year, has created no little comment among yachtsmen.

The boat-builder, Mr. Geo. Roache, is building for his own use a catamaran, which is to be composed of two outrigger boats, each 30 feet in length, 2 feet 3 inches depth of hold and 2 feet 2 inches in beam. The platform is 8 feet wide and 14 feet in length, and is fixed midway between the two outrigger boats, which are fifteen feet apart. The catamaran will carry a jib and mainsail rig, and when loaded will only draw nine feet of water.

NEW MODELED YACHT.—Mr. John C. Foster, of East Gloucester is having a yacht built on a new model, which is expected to afford extra speed and good seaworthy qualities. She will be between 50 and 60 feet in length of deck, with keel about three-fourths as long, and a deck width of nine feet.

NEW YORK YACHTING NOTES.—The schooner-yacht Atlanta will be put in commission on the 15th prox. ... Mr. S. J. Colgate's yacht Idler will not be brought out this season. ... The Tidal Wave has been thoroughly overhauled. ... Mr. A. Cary Smith has been making important alterations in the sloop Madcap, now owned in Boston. Her shoe has been dispensed with, and the balance of sail preserved. ... The schooner-yacht Nettie is fitting out for Europe. ... Mr. W. H. Langley, the owner of the Comet, which will not race this season, has returned to the New York Yacht Club the Bennet Challenge Cup recently held by the Comet, and it will be one of the prizes competed for at the June regatta of the club. ... The measurements of the new schooner-yacht Intrepid, N. Y. Y. C., are: length over all, 116 feet 3 inches; at water-line, 100 feet 11 inches; beam, 24 feet 5 inches; depth of hold, 11 feet 6 inches; draught of water, 11 feet 6 inches; tonnage, 270.60 tons; cubical contents, 13,422.76. She is to be commanded by Captain Belmont, recently of the schooner-yacht Clytie, and before that of the schooner-yacht Ermengarde.

SOUTH CAROLINA.—Interest in aquatic matters is reviving. The Charleston Regatta Association will probably soon prepare a fine programme for their annual regatta. Several yachts are now being prepared for the fray. The Carolina Independent Boat Club, which has among its members some of our best oarsmen, will put some good crews on the river this year. ... The Palmetto Boat Club held their anniversary meeting on the 20th. Pres. E. A. Smyth having declined re-election, Wm. M. S. Lesene was elected President; Robert M. Means, Vice-Pres.; Charles S. Chervey, Sec. and Treas.; H. Nabb Parker, boatmaster. The new President, Mr. Lesene, is one of the oldest members of the club, and the enviable position now held by the Palmettos is in a great measure owing to his personal exertions. The club is in a very flourishing condition, both financially and as regards membership, and they expect to keep to the front this season, as they have done hitherto on almost every occasion. It is rumored that a splendid first crew is made up, and among them some of the old first crew of the Palmettos, whose backs never have been seen in a race. YENOTS.

Charleston, March 22.

—The Florida Yacht Club of Jacksonville, Fla., gave a reception last Monday evening to Capt. Jas. B. Eads.

—The Mystic Boat Club will hold its annual regatta June 8.

RHODE ISLAND CHAMPIONSHIP.—The Narragansett Boat Club, of Providence, has challenged the Boat Club of Pawtucket to a three-mile race, with turn, in six-oared shells, for the championship of Rhode Island and a four-oared shell. The time and place has to be mutually agreed upon.

—Yale sends Kennedy, of Philadelphia, and the University crew of '66, to the Seneca Lake regatta.

THE WATKINS REGATTA.—If we may judge from the great interest in the forthcoming regatta at Seneca Lake, that event will be one of the best attended events of recent years. About April 1 the Watkins Regatta Association will issue circulars containing full information respecting the boating reunion on Seneca Lake the latter part of May.

—Plaisted is practicing on the Harlem. He rows Hanlon on Toronto Bay May 15.

—The Carman Boating Association, of Carmanville, N. Y., will send representatives to Seneca Lake.

OSGOOD'S PORTABLE BOAT.—Messrs. Osgood and Chapin, of Battle Creek, Mich., manufacture a new portable folding canvas boat, which unites in its construction the very desirable merits of simplicity, lightness and durability; and its price, \$20 and \$35, is, moreover, within the means of a moderate purse. Fitted for trout, ducking, etc. The boat weighs 20 pounds; with bottom-boards, oars, etc., 40 pounds.

Tiffany & Co., Silversmiths, Jewellers, and Importers, have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they prepare special designs for similar purposes. Their **TIMING WATCHES** are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. **TIFFANY & CO.** are also the agents in America for Messrs. **PATEK, PHILIPPE & CO.**, of Geneva, of whose celebrated watches they have a full line. Their stock of Diamonds and other Precious Stones, General Jewelry, Artistic Bronzes and Pottery, Electro-Plate and Sterling Silverware for Household use, fine Stationery and Bric-a-brac, is the largest in the world, and the public are invited to visit their establishment without feeling the slightest obligation to purchase.

THE PRACTICAL

KENNEL GUIDE!

With Plain Instructions How to Rear and Breed Dogs for Pleasure, Show and Profit.

The work contains additional chapters upon the "Law on Dogs," and "Non-Sporting Kennel."

BY GORDON STAPLES, M. D., C. M., R. N.

Illustrated; 192 pages; 12mo, cloth, \$1.50.

THE DOG,

With Simple Directions for His Treatment, and Notices of the Best Dogs of the Day, and their Breeders or Exhibitors.

BY "IDSTONE."

New Edition, with Illustrations; 12mo, cloth, \$1.25. Sent post-paid on receipt of price.

CASSEL, PETER & GALPIN,

March 21 8m 696 Broadway, New York.

Sportsmen's Routes.

CHICAGO & ALTON RAILROAD.

THE ONLY DIRECT RAILROAD from Chicago to St. Louis, and Chicago to Kansas City, WITHOUT CHANGE OF CARS. **FIRST-CLASS ACCOMMODATIONS IN EVERYTHING.**

SPORTSMEN will find splendid shooting on the line of this road; prairie chicken, geese, ducks, brant, quail, etc. Connects direct at Kansas City with the Kansas Pacific Railroad for the great Buffalo and Antelope range of Kansas and Colorado.

Liberal arrangements for transport of Dogs for Sportsmen.

JAMES CHARLTON, General Passenger Agent, Chicago, Ill.

"THE FISHING LINE."

Brook Trout, Grayling and Black Bass Fisheries of Northern Michigan,

VIA THE

Grand Rapids & Indiana RR

(Mackinaw, Grand Rapids & Cincinnati Short Line.) Sportsmen who have cast a fly, or trolled a spoon in the

Grand Traverse Region

will come again without solicitation. All other lovers of the Rod are invited to try these waters, wherein the fish named above, as also Muscalonge, Pike and Pickerel abound.

In no other streams east of the Rocky Mountains is the famous **AMERICAN GRAYLING** found in such numbers. **BROOK TROUT** Season opens May 1. **GRAYLING** Season opens June 1.

The Sportsman can readily send trophies of his skill to his friends or "Club" at home, as also for packing fish can be had at many points.

TAKE YOUR FAMILY WITH YOU. The scenery of the North Woods and Lakes is very beautiful.

The air is pure, dry and bracing. The climate is peculiarly beneficial to those suffering with

Hay Fever and Asthma.

The Hotel accommodations are good, far surpassing the average in countries new enough to afford the finest of fishing.

On and after June 1 Round Trip Excursion Tickets sold to Points in Grand Traverse Region, and attractive train facilities offered to tourists and sportsmen; also Mackinaw and Lake Superior Excursion Tickets.

Dogs, Guns and Fishing Tackle Carried Free, at owner's risk.

Camp Cars for fishing parties and families at low rates.

It is our aim to make sportsmen feel "at home" on this route. For Tourist's Guide, containing full information as to Hotels, Boats, Guides, etc., and accurate maps of the fishing grounds, send to

SPORTSMAN'S SCORE-BOOK
FOR
GLASS-BALL TRAP SHOOTING

In the spring traps now used to throw glass balls for practice shooting, sportsmen have a mechanical contrivance which should entirely do away with the "chances" which exist in trap-pigeon shooting, as the glass ball goes invariably in the direction desired by the trap puller, or in which the trap is set. In bird shooting from a trap—which many dislike on account of the well-known objection to it—there is a large element of chance, as one may have good, slow quacking birds, while his opponent may get strong "in-coming" or "tail-birds," making the match uneven, simply because the one has more casting shots than the other, and is not liable to miss or have his birds drop outside the boundaries. In order to derive the greatest possible benefit from trap shooting, and at the same time test the marksmanship of any number who may be engaged, it is necessary. First, that not only should the trap throw balls in different directions, but that each person shooting should have in every ten shots the same angles at which the others shoot, so that no one may be favored by chance or by the trapper. Second, that a record be kept of each person's hits and misses and the angles on which they occur, so that one may practice intelligently, knowing on what angles he needs more proficiency. It is believed that the plan adopted for scoring, (which has been copyrighted, together with all arrangements, whether of letters, or figures, characters or plates for recording shooting by angles) will be found all that is desired. (For good practice the trap should at all times be hid from view of the person shooting—by screen or otherwise.)

This system not only records the angles so that each person competing assumes the same shots as all the others, but also records the angles on which he fails to break his balls, so that he may practice alone and perfect himself where he fails most. We have carefully examined "The Sportsman's Score-Book for Glass Ball Trap Shooting," by D. E. HOLMES, and can confidently recommend it as being the most perfect system we have seen for keeping a complete record of a shooting match, and equalizing the chances of those engaged, in regard to the direction in which the balls are thrown, by giving each person the same angles at which all the others shoot. The book is well printed on good pencil paper, and contains full instructions together with.

GENERAL GUIDE.

WITH MAPS AND ILLUSTRATIONS.

900 pp., Price, \$3.

BY CHARLES HALLOCK,

EDITOR OF "FOREST AND STREAM," AUTHOR OF THE
"FISHING TOURIST," "CAMP LIFE IN FLORIDA," ETC.

NEW YORK:

The book is a complete manual for sportsmen: It gives every sportsmanlike method for capturing every known game animal, bird and fish in North America.

It designates the proper charges for guns for each kind of game, the various kinds of decoys and blinds, and baits and tackle for the fish.

It gives over 4,000 localities where game and fish may be found, specifies the game found in each locality, the hotel accommodation, and the best route to get there. (The preparation of this Directory was in itself a work of great magnitude.)

It gives the scientific name and specific characteristics of each species it describes, with the habitat and breeding season of each—a most valuable contribution to science.

It describes 291 varieties of edible fish alone, that may be taken with the hook; 80 varieties of ducks; 60 varieties of snipe or waders, and the different methods of shooting each.

Its instructions for capturing large game are very minute, and the chapters on woodcraft, outfitting and camping have been pronounced by "El Cazador," of Los Angeles, California, to be simply complete.

Every kind of dog used for sport is designated, and his points for bench judgment fully given. The chapters relating to selection, breeding, rearing, breaking, care and diseases, comprise a seventh part of the volume. There are 71 prescriptions and recipes given under the revision of the best modern canine therapeutists.

It is in itself the most concise, accurate, instructive, sensible and comprehensive work ever written upon the dog and his diseases. Any physician can administer the prescriptions with perfect confidence in their safety and efficacy.

It contains very useful recipes and remedies for wounds, bites, poisons, illnesses, and emergencies of all kinds; for cleaning, repairing, and preserving every implement used for sport; for selection and use of every kind of boat employed by sportsmen; a reference list of several hundred books in request by sportsmen, and a directory where to buy outfitting goods.

It instructs in taxidermy, and tells how to preserve and mount specimens of animals, birds and fish.

Sportsmen's Goods.

FOX-HUNTER'S ALBUM.

A series of forty Artistic Steel Engravings, illustrating this manly sport in all its exciting features, from the start to the finish. This series of beautiful and valuable Steel Plates is engraved in the highest style of art, printed on heavy plate paper, 9x11 in., a size suitable for framing. Sportsmen's Goods.

HIGHEST HONORS

AT THE
Centennial World's Fair, 1876!

SHONINGER ORGAN

Best Instruments.

Their comparative excellence is recognized by the Judges in their Report, from which the following is an extract:

"The B. SHONINGER ORGAN CO.'S exhibit as the best instruments at a price rendering them possible to a large class of purchasers, having a combination of Reeds and Bells, producing novel and pleasing effects, containing many desirable improvements, will stand longer in dry or damp climate, less liable to get out of order, all the boards being made three-ply, put together so it is impossible for them to either shrink, swell or split." THE ONLY ORGANS AWARDED THIS HONOR.

There are 50,000 of our instruments in this and the European countries in use, and they are so made that they will keep in tune, and stand any climate. They contain a magnificent Chime of Bells, tuned in perfect harmony with the Reeds, producing wonderful effects. The Music Rack, when tuned forward, will make a splendid writing desk, with our Book Closets and Sewing Lamp or Flower Brackets, with a fine stool boxed free with each Organ, makes the SHONINGER ORGANS the most substantial, convenient and perfect Organ.

ESTABLISHED 1856.

We are prepared to appoint a few new Agents.

A liberal discount to the Clergy, Sunday Schools, Teachers, Churches and Lodges. Illustrated Catalogues, with prices, sent by mail upon application to

B. SHONINGER ORGAN CO.,

Gunpowder.

THE HAZARD POWDER CO.,

MANUFACTURERS OF

GUNPOWDER,

Hazard's "Electric Powder."

Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. only.

Hazard's "American Sporting."

Nos. 1 (fine) to 6 (coarse). In 1 lb. canisters and 6 1/2 lb. kegs. A fine grain, quick and clean, for upland prairie shooting. Well adapted to shot-guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 6 (coarse). In 1 and 5 lb. canisters and 6 1/2 lb. kegs. Burns slowly and very clean, shooting remarkably close and with great penetration. For field, forest or water shooting, it ranks any other brand, and it is equally serviceable for muzzle or breech-loaders.

Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting" FG, in kegs of 25, 12 1/2, and 6 1/2 lbs. and cans of 5 lbs. and 1 lb. FFG is also packed in 1 lb. 1/2 lb. canisters. Burns strong and moist. The FFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard rifle powder of the country.

Superior Mining and Blasting Powder.

GOVERNMENT CANNON & MUSKET POWDER; ALSO, SPECIAL GRADES FOR EXPORT OF ANY REQUIRED GRAIN OR PROOF, MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's Agents in every prominent city, or wholesale at our office, 88 WALL STREET, NEW YORK.

Dittmar

POWDER

CO.

This Company has been reorganized and established with abundant capital and business experience, and will be prepared to meet all demands for this Powder. Agencies will be established as rapidly as possible, so that it can be procured of dealers in all parts of the country. It is

Now Used by Capt. Bogardus,
THE CHAMPION WING SHOT,

In all his shooting indoors, and was used by him in the match at Gilmore's Garden, where he broke 5,000 balls in 500 minutes.

Extract from his new book, "Trap, Field and Cover Shooting":

"In this and all matches I have shot indoors, I have used the Dittmar Powder. It shoots strong and clean, and if it can be made uniform it will be as good as any in the world. The load I shot with would have killed old cock grouse in December, or ducks or any feathered game or wild fowl."

It is also

Used Exclusively by Ira Paine
IN ALL HIS MATCHES.

By new process of waterproofing this powder is now made absolutely uniform. MR. CARL DITTMAR will give his whole time and skill to its manufacture.

All communications and orders should be addressed

Dittmar Powder Co.,
No. 1 Cortlandt St.,
NEW YORK.

Lafin & Rand Powder Co.
No. 26 MURRAY ST., N. Y.,

Sole Proprietors and Manufacturers of

Orange Lightning Powder.

No. 1 to 7, strongest and Cleanest made, in sealed 1 lb. canisters. Higher numbers specially are recommended for breech-loading guns.

Orange Ducking Powder,

For water-fowl, strong and clean. No. 1 to 5 in metal kegs, 6 1/2 lbs. each, and canisters of 1 and 5 lbs. each.

Orange Rifle Powder.

The best for rifles and all ordinary purposes. Sizes, FG, FFG and FFGG, the last being the finest. Packed in wood and metal kegs of 25 lbs., 12 1/2 lbs. and 6 1/2 lbs., and in canisters of 1 lb. and 1/2 lb.

All of the above give high velocities and less recoil than any other brands made, and are recommended and used by Capt. A. H. BOGARDUS, the "Champion Wing Shot of the World."

BLASTING POWDER and ELECTRICAL BLASTING APPARATUS, all ready to order, of all kinds on hand and made to order.

Safety Fuse, Frictional and

Platinum Fuses.

Sportsmen's Goods.

A

WHITE RIBBON,

Blue Ribbon

AND

SILVER MEDAL

Were awarded to Messrs. G. W. SIMMONS & SON, of Boston, Mass.,

Through their agents and exhibitors Messrs. Brown & Hilder, of St. Louis, Mo., at the Exhibition of the "St. Louis Bench Show and Sportsmen's Association," for an unusually fine display of Duck, Mole-skin and Leather

HUNTING SUITS,

which attracted great attention and were much admired by all Sportsmen.

THE BOSTON

SHOOTING SUIT.

Manufactured only by

G. W. SIMMONS & SON,

BOSTON, MASS.

NEW YORK AGENTS:

Fowler & Fulton,

300 BROADWAY,

The Best in Use.

ONLY ONE QUALITY MADE, AND THAT IS
THE VERY BEST.

Flexible Waterproof, Tan-Color Duck.

Each article—coat, trousers, vest and hat cap—has the name and manufacturers' address stamped upon it, and no suit is genuine without it bears this imprint.

We make no discount except to the trade. The price of the suit complete is \$13.

The material is of the best quality of duck, waterproofed by a patent process. The color is that known as "dead grass shade."

The seams and pocket corners are copper-riveted, and nothing is neglected to make the whole suit complete in every way.

This is what one of our best sportsmen says of it, writing from camp: "Although I had been nearly eight hours under incessant rain, laboring and striving along under adverse circumstances, yet I found myself comparatively dry, and my clothes without a tear. For the benefit of our brother sportsmen, let me advise one of Messrs. Simmons' (of Boston, Mass.) Waterproof Suits. Oh! what a relief it was to find one's tobacco was dry, and that one could light a pipe; that you could laugh at your miserable friend, who stood shivering and shaking as if he had the palsy; and then, next morning, oh! what fun it was to see him mending his clothes, while I had not a tear to complain of! Ventilation, that great bugbear of waterproof suits, is legislated for in the most ingenious manner. No sportsman should fail to supply himself with a suit which is at once cheap, practical, and will last an almost indefinite time."

Our Flexible Tan-Colored Water-Proof Leather Coats, Breeches, Vest, Leggings and Caps are considered the finest things ever made.

SEND FOR CIRCULAR.

H. M. QUACKENBUSH, Patentee and M'r, Herkimer, N. Y.

Hart's Sportsman's Favorite Metallic Shells.

FOR BREECH-LOADING SHOT GUNS.

These Shells are easily loaded, and the caps easily extracted from inside. Head solid and much thicker than any shell now made, giving a solid seat for cone or anvil, which prevents it from driving through or springing away, thereby causing misfires. The Cone is made of nickel, and fastened solid in its place. Neither rusts nor corrodes fast, like movable anvil made from steel. The Nickel Cone also prevents mis-fire when a cap has been left on shell for a few days, which is liable to occur either in steel or iron. These Shells are finely finished, and made any length ordered, from 2 1/2 to 3 3/4 inches.

Shells and Loaders and Descriptive Price-Lists can be obtained from all the leading Sportsmen's Houses throughout the country.

FROM CAPTAIN BOGARDUS, CHAMPION WING-SHOT OF AMERICA.

MESSRS. GEORGE E. HART & CO.—Gentlemen: The fifty Shells I received from you to-day suit me better than any I have ever used. They are stronger and better in every respect, and I shall use them in all my shooting hereafter.

Yours truly,

A. H. BOGARDUS.

W. W. Greener's Champion Treble Wedge Fast,

Breech-Loader.

THE WINNING GUN.

At the International pigeon shooting, Monaco, Feb., 1878, the Grand Prix de Chasse, an objet d'art valued at £160, and a money prize of £705, the greatest prize ever shot for at Monaco, was competed for by sixty-six of the best shots of all nations, and won by Mr. Chalmers, of England, with a full-choke bore Wedge-Fast Gun by W. W. Greener, killing 11 birds out of 12 at 28 yards and 1 foot and 5 1/2 yards. He also won the second event, killing 8 birds in succession at 33 yards, making a total of 19 birds out of 20. This is acknowledged to be the best shooting on record. The winning gun at the choke-bore match, 1877, beating 17 guns by the best London makers, and winning the silver cup, valued at 50 guineas, presented by Mr. J. Purdy, the gunmaker.

The winning gun also at Philadelphia, 1876, in the pigeon shooting match between Capt. Bogardus and Mr. South for \$500 a side, South killing 36 birds out of 100, using one barrel only.

The winning gun also at the great London Gun Trial, 1876, beating 102 guns by all the best makers of Great Britain and Ireland. THE PATENT TREBLE WEDGE FAST BREECH-LOADER is the strongest and most durable ever invented, and the most successful gun of the period. Patented in the United States, Oct. 6, 1875; No. 165,325. BEWARE OF INFRINGEMENTS OR IMITATIONS.

W. W. GREENER, St. Mary's Works, Birmingham, England.

THE STANTON SIPHON

FOUNTAIN PEN-HOLDER.

The Only Practical and Really Useful Fountain Pen-Holder
Ever Manufactured.

The only Fountain Pen-holder in which the INK does not come in contact with oxidizable metal, and therefore cannot decompose or coagulate. No spilling of ink can occur in filling, as the tube is filled by suction from any vessel containing writing fluid.

No Inkstand or Special Ink Required.

ALWAYS READY FOR USE.

Is a very handsome and convenient pocket article; is made of strong metal, heavily nickel-plated and polished. Contains sufficient ink to closely write twenty pages of foolscap; will feed to the point of the pen until the last drop of ink is exhausted, and being air-tight the ink can neither evaporate nor mould. Is easily replenished, always perfectly clean, and any steel or gold pen can be substituted for the handsome Esterbrook Indestructible Golden Pen furnished with each holder.

Sportsmen will find it a most Convenient Companion when
away from home.

Will carry sufficient ink for TEN DAYS' ordinary use. Especially adapted to the use of Doctors, Lawyers, Commercial Travelers, Collectors, Government Officers, Railway Officials, Tourists, and all who can appreciate the immense comfort in always having their own pen and ink with them.

Sent by mail on receipt of 25 cents, with full directions.

P A I N E ' S FEATHER-FILLED GLASS BALL.

PRAIRIE FIRES NEVER SPREAD FASTER

THAN THE SALE OF THIS BEAUTIFUL AND POPULAR BALL.

One Million and a Quarter

have been sold since August, and our moulds are now running night and day filling our constantly increasing orders.

Every Ball made to scale, and no imperfections. **\$1,000** Reward to any one who can find a single ball in ten thousand beyond the maximum weight (two ounces). No thick sides or bottoms. Its uniformity of thickness won it favor from the first, and out of the immense number sold we have never had one complaint.

NO CLOSE DECISIONS.—A Feather-filled Ball once struck by shot, and the tale is told. *It satisfies every one on the instant, and saves all unpleasant work for Referees.*

NO SHORT COUNT.—Every barrel is warranted to contain enough over three hundred to allow for reasonable breakage. Will also contain copies of the Standard Rules for Glass Ball Shooting, for one, two, or three traps.

C A R D.

During Mr. Paine's absence in England his Patents were grossly infringed upon. Glass Balls and Traps of the most worthless description were sold in large numbers. Balls that could not be broken with a cannon were thrust upon the market by thousands. On his arrival home, seeing this state of affairs, he immediately, with his fruitful brain, invented the Paine Feather-filled Glass Ball. American sportsmen are the best judges of its magnificent success.

No Sportsman's Warehouse is Complete without Paine's Feather-filled Glass Balls. Men and Boys, from Maine to California, shoot at them! Old ladies darn socks on them! Children learn Geography on them! Babies cut their teeth on them! If you want a Ball for main strength and endurance try some other.

W A R N I N G T O A L L.

The following will show how fully we are protected in the manufacture of the Paine Patent Feather-filled Glass Ball, and as the price is SO LOW there is little or no incentive beyond curiosity to infringe on the Patent:

UNITED STATES PATENT OFFICE.

IRA A. PAINE, OF NEW YORK, N. Y.

IMPROVEMENT IN GLASS-BALL TARGETS.

Specification forming part of Letters Patent No. 196,379, dated October 23, 1877; application filed September 23, 1877.

To all whom it may concern:

Be it known that I, IRA A. PAINE, of New York City, in the County and State of New York, have invented a new and useful Improvement in Balls for Trap Shooting, of which the following is a specification:

The figure is a side view of one of my improved balls, part being broken away to show the construction.

The object of this invention is to furnish balls for trap-shooting which shall be so constructed as to "make the feathers fly" when broken by the shot, producing the same effect as when birds are struck by the shot.

The invention consists in a hollow glass ball for trap-shooting, filled with feathers or other light material, as will be hereinafter fully described.

A represents the ball, which is made of glass, is smooth upon the outer side, and has a neck upon one side for placing it upon the trap.

For sale by all Dealers in Sporting Goods throughout the world.

The ball A is filled with feathers B or other light material, as shown in the figure, which, when the ball A is broken by the shot, will be scattered through the air, showing that the ball was broken by the shot, and producing an effect similar to that produced when a bird is struck by shot, and enabling the marksman to see the effect of his shot, the smoke having time to disappear before the feathers can possibly reach the ground.

Having thus described my invention, what I claim as new, and desire to secure by Letters Patent, is—

A hollow glass ball for trap-shooting, filled with feathers or other light material, substantially as herein shown and described.

Bogardus' Patent Rough Glass Balls and Glass Ball Traps.

These Traps are the only ones that give satisfaction, as they are simple of construction, easily set, and not liable to get out of order, and they throw the ball in a manner that more closely resembles the flight of a bird than any other trap in the market. The Patent Rough Glass Balls are made of uniform weight and thickness, and have a corrugated surface that strengthens the ball for shipment to any part of the country, prevents the glancing of shot, and thereby insures the breaking of the ball when hit. CAPTAIN BOGARDUS was the first to introduce the ROUGH BALL, and at a price far below the smooth ball at that time.

Balls and Traps can be ordered through all Gun Dealers. Liberal discount to the Trade.

MY IMPROVED TRAP (warranted), which will throw a ball in any direction from the shooter at the option of the puller, is now ready for the market. Price 88. Old style, 86. Parties buying glass balls will receive, in each barrel containing 300 balls, score book and rules for glass ball shooting, containing 40 pages.

A SOLITAIRE.

A SOLITARY life the heron leads
In every land;
In thoughtful equanimity among the reeds
You see him stand,
As if great problems or heroic deeds
His thoughts command.
He comes from out the sky with slanting night
Down through the air—
As if a flock of cloud from realms of light
Were falling there—
And scans a murky beach with watchful sight
And timid care.
At rest he shuts his wings with quiet pride,
And seeks the dredge
Of weeds and mosses woven by the tide
Within the sedge—
Some lonely spot along the river side,
Or bayou's edge.
Think not he comes from labored flight to seek
For needed rest;
Or that his lonely life is but a feast;
The grim behest
Of hunger makes his whole demeanor bleak,
And food his quest.
If fish or serpent, heeding not the form
That stands so still,
Comes lurking near, all reckless of the harm,
A flashing bill,
With never a premonition of alarm,
Will strike to kill!
The solitary life the heron leads
Is like some men's;
His thoughtful equanimity among the reeds
And silent fens,
Reminds of the stoic men of deeds
Who strike with pens!

J. C. BURNETT.

For Forest and Stream and Rod and Gun.

A Week on the Hushpucknia.

A PARTY of us, five in number, started down the Mississippi about the middle of November last, bent on slaughtering something in the way of game—that is, I speak for myself, for the main hold of the balance of the party was bear. Our generalissimo had collected together, by begging, borrowing, trading and, I guess, *purchasing*, six as large and ferocious curs as one could imagine. Our pack consisted of seven in all, we taking one old bound that was used to the business as a leader, and the curs to do the fighting. The latter seemed to understand what was intended for them, and to keep in practice they fought among themselves whenever opportunity permitted. While waiting for the train or boat they would while away the tedious hours by a little wool picking. They fought in the baggage car, on the boat, in the woods and at camp, or any place, it made no difference to them whatever. When we were at a loss for other amusement we could, at least, have a first-class dog fight with all the latest improvements.

As I stated above, we had started down to the game country, but had not determined where we would hunt. We all agreed at last upon the Sunflower county of Mississippi. We got off the boat at Australia, 185 miles below Memphis. The weather was all that could be desired, except a little warm for us, as we were used to a colder climate. We laid in our supplies at Memphis, and all we had to do now was to find where to go and go there as soon as possible. We made inquiry among the natives and were told that game was everywhere about there, and back some distance people could scarcely live for the bears. They told such fabulous tales of what a hunting ground Hushpucknia was that we forthwith decided on that as our field of action. The distance varied as much as the men. They called it from seven to fifteen miles from the river. We found a man willing to haul us out there though for \$5, and we struck out with the firm conviction of eating venison before sundown. We found the roads almost impassable from recent rains and hauling, as it was in the height of cotton and cotton seed delivering. We were informed that it had been raining more or less for three months; and it looked like it, for the low ground was full of water; an immense amount of cotton was still standing out, as the weather would not permit its being picked. We found we had blundered by coming this season, but were hopeful, as every one we met assured us we would have grand sport, there were "lots of bear," and gave us thrilling accounts of how they stole their pigs and destroyed their corn, etc. How we waded water and split mud! What cared we for that?

all we wanted was to get a peep at a bear. We looked upon the simple-minded natives with contempt for not dropping everything else and going a-bear hunting.

We had to give up all notions of aiding ourselves and be content if we only got our luggage hauled. The mules composing our team were small, and, like all others, lazy, and the darkey driving had to lay the whip on vigorously, accompanied with choice expletives. I was raised in the Sunday-school and forbear quoting, as such language jars my nerves. We got within two miles of our destination when the team gave unmistakable signs of giving completely out. We concluded to strike camp and trust to luck to get the balance of the way, as it was then after sundown.

While the others were fixing around for the night, the General and I struck out through the cane to get some venison for supper. My gun was an old hummered barrel Kentucky rifle of about fifty to the pound. The barrel was 45 inches long and looked as if the maker had just that much iron in a piece and did not want to cut it. It was a trusty old piece, however, and just as good 200 yards as ten, if held straight. The others had shot guns. The General and I stayed out until dark, but found no game. We saw some old deer sign and a bear track or two, which gave us hope.

The next morning was the holy Sabbath, and while some were hunting up a team, I shouldered "Long Tom" and struck out through the woods. The others at camp being of a religious turn of mind, declined following except far enough to "get some hickory nuts," and for fear of "meeting a bear" carried a large six shooter along. I went about two miles through wet slashes and low cane ridges covered with switch cane. I saw some of the finest oak timber I ever saw, but very little sign of game.

We got a team without much trouble, and noon found us camped on a low ridge, with cane and water all round us. The cane was on three sides of us and varying from ten to twenty feet high, while the water was in front and was from two to six inches deep. Not a very cheering place for a camp, I admit, but when the old man that hauled us out got warmed up with a "jigger," as he called it, and his tongue loosened and began his marvelous tales of the amount of game about there, I reckon there never were five happier souls than we were at that time.

After getting things fixed up, I slipped out to leave the woods and look for signs. I found a few deer tracks and some of the heaviest cane brakes I ever heard of. Cane from twenty to thirty feet high, as thick almost as they could stand. One can draw some idea of their density by this. There were places where the cane had fallen down and bent over so that a man could walk over them. I walked on the top of cane four feet from the ground. It was like walking on rotten ice, through which one would break now and then, and it was fully as hard to scramble up on the cane as it is to get on the ice after breaking through. And the imagination of falling into a den of wild cats or a nest of bears fully equals the tickling sensation of freezing water slipping up one's leg.

Two of our best bear-hunters had also gone out with the dogs and were kicking up a fearful racket. I thought certain they had a bear up, but learned presently that it was only a dog fight. They reported lots of bear sign, and we went to bed early so as to get at them soon. The morning dawned bright and beautiful and we were almost tasting bear meat—in fact, we got up quite a discussion how we should cook it. Our dog commander summoned his forces, and three of us took stands where we thought the game would be most likely to run. The dogs would not hunt, none except the hound, and any one who has had anything to do with hounds knows that one by itself is not much. Our famous bear dogs would trot along behind and wait for us to break roads through the cane for them. I waded sloughs and canebrakes all day, and all I could get a shot at was a black squirrel. I skinned it and stretched its hide, as it was something of a curiosity, for I began to fear that our trophies of the chase would be small. I found considerable sign of game, but it was of old date, as if the game had made an exodus about the time we arrived.

I stayed out until near sundown. The other men came in at noon and went out again. They had not got in from their afternoon's hunt when I got in. I learned from the cook that their spirits had undergone a change since morning. Dogs would not hunt; water and cane so bad; where the cane was one could not get through scarcely at all, and the water was very disagreeable wading, as none of us had gum boots. After tramping all day I felt as if I had a great vacuum somewhere. After getting all right again, I started out to blaze some trees so we could find our way to camp more easily, for one might be within forty feet of it and not know it, unless some one there would make a noise, as the cane completely hid it from view. It is the most glorious place to get lost in I ever was.

I met the other fellows coming in, and they were in glorious spirits. They had struck a bonanza sure. They were terribly excited, such signs as they had seen surpassed anything we had imagined in our wildest dreams. Tracks as large as a man's hat; trees literally torn up by the roots; beds large enough to accommodate twenty; the largest bear we ever heard of, etc., etc. I flew back to camp and got the ax and cane knife, and we worked manfully, cutting roads, bridging sloughs and blazing paths, and fixing up for a general havoc the next day. We went back to camp tired, wet, and, that hoon of a hunter's life, hungry, but perfectly happy. Just after dark it commenced raining and rained most gloriously

until daylight. Our tent was ordinary duck, not waterproof, nor well stretched, and we got ourselves and everything else except our powder, wet. We managed to keep our guns and ammunition tolerably dry and let the rest go. The morning was the most gloomy and heaviest clouded I ever experienced. The clouds were scudding across the sky from a southwesterly direction and looked as if at any moment they would burst open and give us a second flood. We ventured out, however, and did our best to raise a bear, but after wandering around for a couple of hours without success, gave it up as a bad job and returned to camp a sadder if not a wiser lot of men. It was impossible to go anywhere. We would start off, getting the course from the compass, and after wandering around awhile would find ourselves everywhere but where we wanted to be. We would get lost in five minutes, and if we had not stationed a man with a horn to give us the course we might have been there until now.

I could not stay in camp, and, after resting a little, I struck out on my own hook. The sloughs had risen four inches from the rain, and the cane was so wet I got soaked through in going a short distance. It commenced raining about two hours before night, and found me two miles from camp without my coat, and sloughs, canebrakes, etc., without number. I got my course and lit out, and got in about as wet as is possible for a man to be. The sum of the third day's hunt was a large hawk that I knocked over and four as wet men as ever come along. The bear hunters were exceedingly low, and I began to fear that even burnt brandy would not save them, although frequent visitations to the jug containing the raw article seemed to help them a little.

The rain continued all through the night, and it was none of your gentle, refreshing Southern showers which one reads of; it was a regular pour down, and it was only by the hardest exertion we kept our fire alive. The fourth morning dawned almost as gloomy as third. Water everywhere, in camp and out. A few of us ventured out, but found our roads impassable from water. When we got back to camp we found our old friend the teamster had come to get us out of the water. There was nothing remarkable about him, and he was far from handsome; but we were about as glad to see him as most any one we could name. Don Pedro was nowhere. We brought the jug and drained it for one more "jigger," which he turned off with a vim. As I was one of the young men of the party, I was d d tailed to go for his wagon. I had a nice, pleasant walk of two miles through the cool, refreshing water, which varied from four to twelve inches deep. All things must have an end, however, and the middle of the afternoon found us camped on the high banks of Hushpucknia, and happy once more.

The stream we were camped on is a tributary of the Sunflower River, and heads somewhere in the northern part of Bolivar County. It seems to be a considerable stream, large enough to float a small steamer. I did not see much of it, though, and no one around there seems to know anything about it; and as it is not laid down on any maps that I have seen, it is altogether guess-work with me.

The morning of the fifth day was gloomy as ever. We killed a few squirrels and made a deer drive, without getting a run. About noon an old bear hunter came to our camp, wanting to take a hunt with us. He brought about a dozen half-starved, nondescript dogs, all shapes, all sizes and colors. He vowed, though, that they would not "cross a trail," and if our dogs would only help his to do the fighting, we were as good for bear as a bit is for a barlow. We told him that was just to our hand; we held the bows, and all we wanted was some small trumps to lead them out. His dogs came near making a bare trail of our camp by eating everything they could find. It was only by the cook's judicious use of a two handed club, intermixed with some very formidable oaths, that we saved anything. After dinner we got a couple of mules and our best bear hunter and the stranger mounted them. I saw thought bear certain, for it was a strong force mustered out that gloomy November evening. Our old friend of the team summoned his forces—of himself and three boys and a half dozen dogs. Our general started off blowing to the dogs, and all began to look lovely, and the goose hung away out of reach. That was the first act of the drama; the second was more exciting, and came near being more tragical. The mule that our general was on suddenly became displeased with the dogs, crowd, or something else, and all at once there was a grand panorama of a buck-jumping mule, flying gun, and a bear hunter going through the air, making several revolutions to the minute, as if he had suddenly conceived the idea of making a windmill out of himself.

After enjoying a good laugh—the first for several days—the general picked himself up and continued the hunt on foot. They seemed to have enough in the bear gage without me, and I struck out on my own hook. I had seen some fresh deer tracks that morning, and I wanted to go back to the same place. I saw two fine deer—the first sighted by any of the party. I followed them some time, but could not see them any more. I returned to camp in good spirits, for I believed I or some one else of the party would get one the next day. I found the bear hunters had returned without getting a run, and the sum total of the hunt was a coon and a possum; the latter they managed to lose coming in. Our party now began to get the "blues" to an alarming extent. The hitters had given out, and we had no way of replenishing them. I suggested a dog fight, thinking to arouse them a little from the "slough of despond," but they sadly shook

their heads. Even dog fighting had lost its charms. The night was enlivened by a herd of cattle that smelt the one hundred and fifty pounds of salt that we brought along to salt our bear meat. They would tramp all around the camp, walk over the dogs, poke their heads into the tent, and scatter our traps promiscuously. At the first peep of day three of us went for deer. After waiting some time one of our party obtained a running shot, but effected nothing. We returned to camp and put in the day by chasing the cattle away from camp. The seventh morning was cool and frosty. Four of us went for deer, but with the same success as heretofore—got nothing.

We now came to the following conclusions:

Firstly. That there was plenty of game there.

Secondly. That it would stay there for all we could do to keep it from it.

Thirdly. That bear was dry meat anyhow.

Fourthly. That home was the best place after all.

The above resolutions being unanimously carried, we set about preparing to leave. The next day being Sunday, and teams idle, it was decided to leave then. A drizzling rain fell all day, and we failed to get out to the river on Sunday; but Monday found us on our way. I took one more little round for deer and joined the party about two miles from camp. I laid old "Long Tom" sadly in the wagon, and I will not say what I thought about bear hunting then. The roads were better, as the rains had thinned the mud, and if one did go a little deeper, it was not so hard to get out. We got to the river in time to board a boat before night, and were happy again. Some of your readers may wonder what I wrote this for, as there is nothing remarkable chronicled in it—no hair-breadth escapes from panthers or wolves, or suffocating hugs from bears or anything else, like most of the letters to your paper contain. That is just it. I wish to state to some of the uninitiated that a hunter's life has its ups and downs as well as any other; that it does not always run smooth and flow with milk and honey.

Although we made a miserable failure, we are far from being disheartened, and if everything works right, next November will find some of us back there. We have learned the way and got acquainted a little, and with the right kind of season, a party could have glorious sport, as there is any amount of game there.

PADDY O'LEARY.
Ashbyburg, Hopkins County, Kentucky.

SHOOTING ON GREAT BAY.

As viewed at high tide, a more beautiful sheet of water it has rarely been my good fortune to see in a somewhat extensive traveling experience, than Great Bay in Rockingham county, N. H., some four miles from Portsmouth. Surrounded as it is with charmingly diversified scenery, with well cultivated farms stretching down to its shores, beautiful with wooded capes jutting out into its waters, paradises for picnic parties and deliciously shaded little nooks into which one may sail to escape the heat of the summer sun, it has many a time been a source of never ending delight to me, as I have skimmed over its placid surface and realized that keen sense of enjoyment that makes one glad to be alive to feast his eyes on the rich beauties of nature.

But not the least among its many charms are the facilities and felicities which Great Bay furnishes to the sportsman, to tell of which this article was more especially written than for the purpose of describing this great reservoir into whose basin the Piscataqua River pours its rushing tide. To those sportsmen, whose numerous inquiries I see in your valuable paper as to where good shooting can be found, I would say, here is an opportunity for you to try your skill on the water-fowl that make these waters their resting place and feeding ground during their spring and autumn flights. From the great wild goose down to the little "dipper" duck through all the grades of water-fowl that wing their way along our coast, some are almost always to be found, in their season, upon the bosom of this beautiful bay; but let no sportsman, who may condescend to read this communication, come here with the expectation of making the enormous bags such as are shot on the Chesapeake and at Currituck or the prairie sloughs of the West; indeed, for myself—than whom no one can be more fond of the gun—there is but little sport where such a surfeit of game can be found; for, in my opinion, sport degenerates into slaughter, and there is more satisfaction for me to stop the lightning flight of the ruffed grouse in full October plumage, than to bag a dozen brace of teal or mallard where they exist in such profusion as I have seen them in the prairie water-holes of Western Kansas. I read—more with sorrow than with envy—of men, calling themselves sportsmen, shooting down hundreds of water fowl in the course of a day, many of which must necessarily spoil unless shot for the market, and many of which they allow to escape, wounded—especially if bagging them is attended with any exertion; and then they call this indiscriminate destruction sport. I have no patience with such libels on the name of sportsmen.

The water fowl which, during their flight, make this their rendezvous, are, generally speaking, and more especially in the spring, the wariest of their kind. Shot at, as they are, from every available point in their long autumnal journey to their southern resorts, and running the gauntlet of a like fusillade during their return flight to their far-away breeding haunts in the north, all the skill of the hunter is required to get them within reach of his gun. In the fall larger bags can be made; probably because the young broods, from lack of intimacy with the hunter, are more unsophisticated and not posted in the many wiles originated for their destruction. But the spring bird is an entirely different customer, and the hunter who can show four or five brace for his day's work goes home with a good appetite for his dinner and the feeling that it has not been wanton destruction on his part, but simply a match of human cunning against the wary shyness of his game.

All shooting is done here from a "float"—a very light boat some twelve or fifteen feet in length, with a square stern perforated a little to the left of the centre, with a "scull-hole," the edges of which are lined with leather; that part of the paddle which in sculling is in contact, is also lined with leather in order that in working the boat the noise shall be reduced to a minimum. This description may not be considered superfluous by some of your Western readers, who are, perhaps, unaware of the difficulties Eastern sportsmen have to contend with in approaching this species of game. With one of these "floats" so-called, its "gunnel" entirely concealed by a covering of eel-grass or rock-weed, the gunner takes his place in the bows on a bed of straw, reclining in such a position as to be hidden from sight of everything on the surface of the water;

his companion, who sculls, assumes a like attitude in the stern, with his head just sufficiently raised to see over the bows of the boat. In this position, the birds having first been sighted with a good spy-glass, the boat is noiselessly sculled to within shot, if possible, or until the movements of the birds give evidence to the silent worker of the "float" that their suspicions are aroused, and they are about to take flight. It is no easy matter even for the most skillful boatman to approach these shy water-fowl, ever on the alert for danger, and well knowing, by hard experience, to shun every object that looks even most remotely like a device of their greatest enemy—man. Here is the place where the shooting power of a gun can be well tested. Many birds are brought to bag from sixty up to seventy-five yards, and old gunners speak of having knocked over geese at one hundred yards or more with their old-fashioned, bell muzzled ducking guns, with barrels six feet in length.

Portsmouth, N. H., March, 21, 1878.

DECK SHOOTING IN SOUTHERN ILLINOIS.—Since last December some of us sportsmen have been looking forward with no small amount of interest to a grand duck and camping-out expedition, to take place about the first of March (or whenever the ducks begin to come in) at the great duck grounds, the lakes south of Jonesboro, Ill. Our friends at Jonesboro were to keep us posted as to the best time for the three of us to start from the vicinity of St. Louis. Last Tuesday a dispatch came, worded thus: "Come by first train; the lake is filled with ducks. There's millions in it, and more coming." That was sufficient, but right here a disappointment stepped in—two of our party found that it would be impossible for them to go, and so your humble servant was forced to go unaccompanied. After a ride of 140 miles, at 3:42, Wednesday afternoon, I arrived at Jonesboro and found Mr. D., Mr. C. and Jim at the depot, and the greeting I received was both appreciated and reciprocated. And right here, I remark that there is something about the greeting extended by one sportsman to another that is different from most any other greeting in vogue. There is a whole-souled heartiness about it that is both contagious and refreshing; it is so entirely void of any selfishness that it is received and returned with the same gusto. I think that my fellow sportsmen will bear me out in this assertion.

Daybreak coming, morning found us busily packing our wagon with camping utensils, etc., and soon we were on our way to the lakes, where we arrived about noon. After having selected our camping ground close by the lakes, we speedily pitched our two large tents, and, in a short time, seemingly an incredibly short time, we had fire made, coffee boiling, table spread, and were partaking of the abundance of good things before us, only interrupted by watching the flight of ducks which constantly passed over us. The meal over, pipes were brought into service, and about five p. m. the rubber boots were put on, shells inserted into belts and pockets, and, walking fifty yards, each selected a boat and slowly pushed (we used push-poles only) away to the different points and passed for our evening shooting. We returned at dusk highly delighted with our sport, and counting heads (duck heads) we found sixty-eight on hand. After a good supper (and the way we made the food vanish would be a mystery to any one but a hungry hunter) jokes and reminiscences of former hunts held the boards; and, Oh! how we did make those old woods ring with the laughter that could not be contained. Before long, however, drowsiness ruled the hour, and in a short time nothing was heard but the dismal croak of the frogs, and the occasional "honk, honk," of the wild geese in their flight; and last, but by no means least, the sordid frightful communications and exclamations made by Jim in his sleep. At four o'clock, while yet everything was dark, we were all up, fire re-kindled, a hasty breakfast eaten, belts recharged with shells, a hurried consultation, and then to the boats; the water baled out, another word, and each slowly and silently glided into the gloom. D. and C. went to points nearly opposite to each other down the lake; W. and Jim opposite each other in the middle of the lake, and I up to the head of the lake. After having pushed my monitor into a good point and getting in readiness, I sat down to await the approach of dawn and ducks. I shall never forget that morning's shooting. I had not remained in my cover long before the coming of the morning became apparent; the darkness began to change to a grayish tint, and as the faint streaks of light flashed up from the eastern horizon, heralding the nearer approach of the great luminary, I fancied I could see to the further end of the lake. Ah, what's that? Clear down the lake there shoots up a thread of fire, and boom, boom comes floating up to me. Now for business; those were C. and D.'s guns I thought. Boom; there goes Jim; and boom, boom; now W. has "turned loose on them," and before I'm fully prepared here they are right on to me. I discharge the first barrel; missed, by all that's pleasant! Not so with the left, however, for down he comes right by me, quite dead. Quickly extracting the shell and as quickly replacing it by a loaded one; again I am ready for them, but none too soon, for the continued firing of my companions below me kept the ducks sweeping over me in a continued whirl; and how we did give it to them! I would fire at a fine flock; back they would go only to receive two barrels from W., and then over to Jim to receive a similar compliment, and then right down to D. and C., who were most certain to get two or three of them. So the sport went on; bang, bang, on every side. By nine o'clock we are pushing back for camp, perfectly satisfied with our morning's work. Again we count heads, and this time we find, for us all, 210. This was not so bad considering the fact that some of us were not the best shots in the world. The rest of our shooting was only a repetition of this just described, and we returned home Sunday fully satisfied with the amount of sport afforded, all declaring that a more delightful time could not well have been had; and we promised each other that the fall shooting should find us all grasping hands again, and ready for the ducks at the old camping grounds.

Lebanon, Ill., March 10.

THE LAST TREE IN THE BOWERY.—The button-hall in front of 164 Bowery, this city, is the last of the many trees which once shaded that famous thoroughfare. It has braved the storms of seventy years to fall at last before the ax of the Elevated Railroad. It is the custom of some savage tribes, when a tree is felled in the forest, to offer sacrifices to the deity of the wood. Some such ceremony would be eminently fitting now if, indeed, the sylvan deities have not long departed from these haunts. The gamins would make an edifying priest, and that elixir peculiar to the Bowery a fitting libation.

Fish Culture.

SALMON IN THE HUDSON.—Professor Spencer F. Baird, of the Smithsonian Institution, writes us in regard to the salmon found at Peekskill, in the North River:

"I have little doubt that the salmon found in the North River was a spawning fish that had entered the river last summer or autumn, and remained there throughout the winter. This a very common thing in the Penobscot and the streams of Nova Scotia and New Brunswick, the fish returning to the ocean the following spring. I shall be delighted to have the first procurable specimen of a Hudson River salmon, as I have from the Delaware."

—The Greenwood Lake Association placed fifty thousand salmon trout in Greenwood Lake on the 22d March.

—On the 19th inst. 10,000 young salmon were put into Lake Waramaug, Conn. Five thousand were put in four years ago. The Litchfield Enquirer hears they have been seen to weigh two and one-half pounds.

GOLD FISH IN THE POTOMAC.—Washington, D. C., March 29.—My attention has several times been called, during the past three or four years, to the catch of gold fish (*Cyprinus auratus*) in the seines hauled in the Potomac and eastern branch, in the immediate vicinity of Washington. These attractive little fellows, which are so often found in glass globes and other vessels ornamenting parlors, and in aquariums attached to greenhouses, originally came from Chinese waters; but I do not mean to say that they have encircled the globe and altered the Potomac from the Pei Ho or some other Chinese stream. For years they have been in the fountain bowls and basins in our public parks, and especially in the large pool on the west front of the Capitol, in which the Decatur monument formerly stood. After the removal of that monument to Annapolis, stones were loosely placed in the pool, which afforded suitable shelter and crevices for the fish to spawn, and they multiplied rapidly. The outlet from this pool connects with a sewer which empties into the Potomac, and through the wire covering which guards the outlet the spawn has escaped from time to time and been conveyed to the river, where the young fish soon developed and thrived, and are now becoming quite plentiful.

R. F. B.

THE CARP HATCHING PONDS.—The work of converting the lakes south of the Executive mansion into a national carp hatching establishment, is progressing rapidly under direction of Prof. Baird, U. S. Fish Commissioner, and Prof. Rudolph Hessel. In a recent letter I described at length these ponds, and proposed changes to adapt them to the propagation of carp for distribution in southern waters, Congress having appropriated \$5,000 for that purpose. They will soon be ready for the fish now in the ponds of the Maryland Fish Commission in Druid Hill Park. The establishment promises to be a place of much interest, and will surpass some of the renowned hatching ponds of Germany and other European countries.

—Recently Mr. Reilly introduced in the House of Representatives a bill for the preservation of game and protection of birds in the District of Columbia, the provisions of which are the same as that introduced in the Senate by William Edmunds, of Vermont, a year or more ago, and which was noticed at length in this correspondence. A strong effort will be made to have the bill passed at the present session, as we are badly in need of a game law in this district.

PRIVATE FISH PONDS IN VIRGINIA.—In reply to a question from Mr. Charles T. Palmer, Attorney-General James G. Field construes the words "waters of this Commonwealth," as used in the first section of an act entitled an act for the protection of fish in the waters of this Commonwealth, above tide-water, approved April 4, 1877, to comprehend and mean lakes, ponds, dams, rivers, creeks, runs and branches in their natural courses within the limits of the State, and in which fish are found in their natural condition. The language does not embrace nor apply to what are known as private ponds, constructed for raising fish, and into which the owners have placed fish, taken from their native streams, and thereby made private property.—Richmond Whig.

MORE MISSISSIPPI SALMON.—Mr. Jesse Turner, of Van Buren, Arkansas, in a letter dated March 17, 1878, states that he has just heard of the recent capture of a salmon in the Mississippi river, at Helena, Arkansas, just below Memphis. A similar occurrence has taken place recently, which we noticed in our last and previous issues of our journal.

WHITEFISH IN MICHIGAN.—Detroit, March 23.—During the past week the State fish commission, through their agent, C. H. Brownell, of the State Fish Hatchery at Pokagon, planted whitefish fry from Detroit Hatchery, viz.: Adrian, Wampala Lake, 50,000; Hudson, Mallory Lake, 20,000; Hillsdale, Bau Beese Lake, 50,000; Long Lake, 40,000; Quincy, Marble Lake, 40,000; Douglas, Klinger Lake, 50,000; White Pigeon, Pickerel Lake, 40,000; Bristol, Long Lake, 40,000; Baldwin Lake, 40,000, and Indiana Lake, 40,000. All of the above are near the line of the Lake Shore and Michigan Southern Railroad. The following were distributed along the line of the Grand Rapids and Indiana Railroad: Ross, Hilton Lake, 40,000; Crystal Lake, 20,000; Cedar Springs, Oleans Lake, 40,000; Wood Lake Station, Whitefish Lake, 80,000; Wood Lake, 60,000; Clam Lake Station, Muskrat Lake, 60,000, and Traverse City, Ann Lake, 100,000. Over 2,000,000 fish hatched at the Detroit Hatchery this spring have been hatched in Lake St. Clair and the Detroit River.

DRUM.

—The Sandwich, Mich., Hatchery closes this season with a very good record; 50,000 salmon have been distributed in the lower lakes and rivers, and 22,000,000 whitefish have been placed in the Detroit River alone.

—Forty thousand whitefish have been put in Turtle Lake, Union City. Thirty thousand eels will be put in the same lake next June.

—A young salmon, thirteen and one-half inches in length, has been caught in the Kalamazoo River below the dam at Plainwell.

SPAWNING OF CALIFORNIA SALMON.

SAN FRANCISCO, California, March 13, 1878.
 PROF. SPENCER F. BAIRD, Washington, D. C.:

Dear Sir—In reading that portion of the Massachusetts report for 1878 which relates to California salmon, some questions are asked and doubts expressed on subjects which are to me quite clear. I thought it advisable to answer some of these questions to you, if you are not already informed in relation to them.

First—The impassable barrier of which the report speaks across the McCloud River, is only a temporary affair, and is only placed across the river after the great body of spawning salmon have gone to the head waters, and is only used during the necessary time of taking fish in the pool below for spawning purposes.

Secondly—In relation to Mr. Stone's theory that all the McCloud River salmon die after having spawned. Both the Senate and Assembly committees of the Legislature have been taking testimony of all the leading fishermen on the Sacramento River. Probably more than fifty fishermen have given testimony, especially on two points: First, "Where does the spring run spawn?" and, secondly, "Do you catch any fish on their return from the spawning grounds, and what proportions?" On the first question they expressed entire ignorance, except that in the San Joaquin River in the spring large numbers of salmon are ripe or nearly ripe; they are also ripe at this season in the short coast rivers. The concurrent testimony of the fishermen was, that in October and November in the Sacramento river they caught from five to fifteen per cent. of fish that had spawned. Many of these were taken on the "back of nets," drifting toward the ocean with their heads up the stream. This testimony was given by fishermen who had fished at Vallejo in salt water, at Rio Vista and Collinsville in brackish water, and so on up to Sacramento in entire fresh water. They all concurred that about ten per cent. of the catch in October and November was of fish on the return from their spawning grounds; they do not draw their seines for these fish as they will not sell and are considered of no value. They say that these fish are black, hooked-mouthed and have dog's teeth. Some are caught on the right side of the net, but a majority drift into the net on the upper side. They said that they saw them in large numbers at this season of the year, and they were usually with head up stream with only sufficient motion to their fins to keep them balanced, and floating to the sea with the current. I know of my own knowledge that some of the McCloud River salmon remain in the river until the next year. On the 5th of July last I was fishing on the headwaters of the McCloud River about fifty miles above the U. S. Fishery, catching salmon and trout. The salmon that season had just arrived and would take the hook, but in the pools there were also numerous salmon of the previous year—hook-mouth and dog-teeth—which could not be tempted to take anything. Sir John Reed, who was fishing in the same pool with me, improvised a long gaff with which he caught one of these fish of the previous year. Although thin, it weighed twenty-two pounds. We saw several others but did not attempt to take them. These fish certainly must have remained in the water six or eight months without food, and for some unaccountable reason failed to return to the ocean. It is certainly true that large numbers do die and get injured, but from the testimony of the fishermen I am satisfied that large numbers return to the ocean each year. The opinion of the fishermen is that they return to the ocean after spawning, with the first rains on the headwaters. The coast rivers salmon spawn in January and February in the short streams that empty into the ocean, and immediately return after spawning. Most of our coast rivers have bars at their mouths thrown up by the waves, and when these rivers and streams are low fresh water passes through these sand bars to the ocean. When the floods come in the winter they tear open a passage through these bars. The salmon immediately enter and work up into all the small branches in the hills where it is possible for them to reach, spawn in a few days and immediately return down stream into the ocean. It was but last Saturday I took seven of these salmon in pools in a small stream which ran through a pasture within twenty miles of San Francisco. This stream empties into the Bay. Our winter rains have been more heavy than usual, and all these short coast and bay streams are full of salmon spawning.

Now, as regards young fish, I have repeatedly taken young salmon, one year old, with a fly, at the N. S. fishery in July and August. These young fish were always in the centre of the river, while trout would be taken in shoaler water near the shore. I am, therefore, certain that some of them remain in the river for one year after they are hatched. Many grise are taken in the bay here from the wharfs, weighing from three-quarters of a pound to five or six pounds. I have never seen any taken in salt water which I thought was younger than two or three years. I am certain that Mr. Stone is in error in reporting that California salmon die after having spawned.

The Joint Committee of the Senate and Assembly have agreed to report a bill for the close season, from August 1 to September 15, and also from Saturday noon until Sunday noon of every week throughout the year. We have urged that in addition to every Sunday, the close season should be from August 1 to October 1. This concession has been made to the fishermen, who ask that in consideration of giving them the additional two weeks, that the penalties might be increased to \$25 for each salmon found in possession during the close season, and \$250 penalty and confiscation of any net found in the water during the close season. They also promise that they themselves, in their own neighborhoods, will see that this law is faithfully observed. In their testimony they admit the benefits derived from the artificial hatching of salmon, and urge upon the Legislature to increase the appropriation for this purpose, but did not seem willing that the close season should be longer than one month and every Sunday. So this bill, as reported, is a compromise as between what we ask and what the fishermen want.

Shad are becoming quite numerous, and there are one or two every day in the market, which sell for from five to eight dollars a piece. They are generally caught in the bay by fishermen fishing for herrings.

B. B. REDDING.

WHITE TROUT.—Editor Forest and Stream—I have hatched trout for six years, and during that time have hatched out several "white trout." Have never had one live to six months old. They always prove weak and in time are found against the outlet screen dead. I find none this year among my 30,000 fry. Yours,
 Levi Hodges.
 London Trout Ponds, March 30, Farrington, Ct.

\$5 Breech-Loading rifles, brand new. The greatest bargains ever offered. Elegant flash. Best steel rifled barrels. Cannot be bought of any other house for less than \$20. They cost to manufacture over \$15. See advertisement, G. W. Turner & Ross, 26 and 28 Central street, Boston, Mass.—[Adv.]

Natural History.

THE EUROPEAN STARLING.

EDITOR FOREST AND STREAM:

Your Texan correspondent, N. A. T., asks you many questions about our starling. Will you allow me to give him some information on the subject?

He first asks, "Is the starling a pugnacious bird to such a degree that he will drive other birds from his bailiwick?" Certainly he is not a quarrelsome bird. His habits are most decidedly social and friendly, and he lives on terms of perfect harmony with almost every other non-rapacious bird. On the broad pasture-lands he feeds with the rooks all the day, and at night he roosts in the same firs, laurels or ivy with the redwing, the thrush and the blackbird. If he ever finds his way to Texas, unless the climate sadly changes his temper, he will never drive the mocking-bird or any other songster from "his bailiwick." And here let me say that your correspondent does no small wrong to our British sparrow when he writes about his "furious pugnacity." Though a bold and brave little bird, our domestic sparrow is not a quarrelsome bird. The fights witnessed by your correspondent in the New York parks, when he saw numbers of sparrows "gathered together in knots and balls, falling to the ground, and fighting one another like forty wild cats," were only "the endless contentions of rivals" about that which has been the cause of war since time was young, "Nam fuit ante Helenam letentia belli causa." At all other seasons but that in which the great natural instinct seizes him, the sparrow is a jolly, good natured bird, but

"When a fuller crimson comes upon the robin's breast
 When the wren lapwing gets himself another crest
 When a titveller its changes on the burnished dove
 Then the 'sparrows' fancy lightly turns to thoughts of love."

And his passionate little heart, full of the presence of a tidy, plump little hen, sideling and bridling and lirting her wings and tail before him with all the arts of an accomplished coquette, sometimes causes him to forget himself so far as to approach her with a certain amount of violence, and, this being resented, leads to a scolding match which soon collects the lady's other admirers from the neighboring hedge, and then ensues the row as described by your correspondent, in which the combatants, gathering into a ball, roll over and over, apparently fighting "like forty wild cats," while in reality not one of them is a feather the worse when the battle is over.

To N. A. T.'s second question, "Is the starling a first-class bug and worm eater?" there is only one answer. The starling is one of our most useful birds. He feeds almost exclusively on the grubs and worms destructive to the grass family. The staple products of Ireland—beef and mutton—owe no small share of their repute to the humble efforts of the rook and the starling. The rich, heavy grass lands of Meath are the starling's favorite feeding grounds, and when his swift squadrons in dense masses roll along the pastures, clearing out before them every root eating grub and worm, it would be impossible to calculate the good that is done, not to speak of the evil that is resisted by the graziers' best and most economical servant. For, as the starling destroys nothing that is useful to man, he receives nothing in return for his invaluable services to the farmer. Wherever a pale and sickly blade or stem points the starling's quick eye to where the root eater is at work below, down goes the averaging beak of the agile bird, and grubby troubles the grass no more. No county in Ireland has finer grass lands than Meath, and no county more abounds with starlings. One winter's evening, coming home from shooting, near Kells in that county, a keeper called the writer's attention to a heavy black cloud just above some timbers about three miles off. "Thin's birds, sir," said he, and where he pointed the starling cloud lifted and rolled away like a vast column of smoke, and then returning condensed again into a huge black mass as its hundreds of thousands hovered over their roosting place before pitching down into the woods for the night. About six miles from these woods, at another Meath country seat, the starlings made their home by night, and as the sun went down came by myriads to roost in the laurels along the shore of a sheet of water close under the drawing-room windows. The owner of the place, an ardent preserver of everything carrying fur or feather, gave the starlings a hearty welcome; but so numerous were the guests who accepted his hospitality, that their droppings produced an intolerable stench, not to be permitted so close to the house. It was determined, if possible, to banish the starlings to a distant part of the coverts; but they would not go. In vain the evening flight, night after night, was received with a blank fusillade. In vain a skilled pyrotechnist from the metropolis, opened fire with rocket batteries upon their devoted squadrons. Dead and dying, battered and scorched, though their comrades might lie thick beneath them, tenaciously as the heroic Osman clung to his fireswept earthworks of Plevna, the starling clung to their beloved laurels, until as a last resource the laurels themselves were cut close to the ground, and the starlings had to seek a home elsewhere.

Now, taking this evidence of their numbers in the centre of the finest fattening land in Ireland, it is safe to conclude that our starlings would do no injury to the graziers on the Texas preserves.

Your correspondent next asks, "Is the starling urban or suburban in his habits?" He is both. In this country he builds his nest indifferently in town and country, wherever a hollow tree, public buildings or private chimneys afford him the accommodation he requires. When the young leave the nest they remain under the guidance of the old couple, and do not travel far, but generally seek the nearest pasture where the little family soon finds another like itself, till from fifty to a hundred birds pack together, and so they remain till the approach of winter compels them to seek a sheltered roosting-place for the long cold nights. They generally select some secluded spot deep in the pine woods, in dense laurel or holly scrubberies, or along the sedgy shores of rivers, lakes or fens. And then the smaller flocks unite at their chosen trysting-place, and form those vast clouds already described.

Your correspondent next inquires, "Does the starling sing well?" The starling is not a songster; at least he has very little pretension to the title. The male bird has a low, sweet whistle, a solitary note, clear and musical, which he repeats at short intervals, perched, it may be, on the topmost spray of an old ash tree, happy in the first warm glow of the early spring sunshine, pluming his glossy coat and whispering in flute-like accents to his listening mate that the season for grubs is close at hand.

In reply to your correspondent's last question it may be said that the starling is decidedly a shapely, pretty bird, and need take no mean place, even among the beautiful birds of your own continent.

And now, sir, as one of your most distant subscribers, allow me to thank you for the pleasure and instruction which your admirable paper has afforded for the last two years to myself and to some other lovers of the Ron and Gun in this island.

Believe me to be your faithful servant,
 Dublin, Feb. 8, 1878.

R. O'C.

[We take great pleasure in laying before our readers the above highly valuable letter, feeling sure that it will prove of the greatest interest to all those who are considering the feasibility of acclimatizing foreign birds in this country, as well as to many others.—En.]

EXTRACTS FROM A NATURALIST'S NOTE-BOOK.

BY TRAIL.

Nov. 30, 1869.—I took to-day, on Salem Neck, a specimen of the Hutehins gull (*Larus hutehinsii*), young. This specimen I mounted and gave to the Peabody Academy of Science. I inquired about it a while ago, but failed to get track of it.

Feb. 1, 1870.—To-day I shot two snow buntings (*Plectrophanes nivalis*), and four shore larks (*Eremophila cornuta*). These specimens I took on Salem Neck near the "Willows." These birds are bright, cheery little fellows, found commonly along the fields and meadows bordering on the sea shore. The buntings are often incorrectly called snow-birds, many persons thinking them forerunners of snow storms. Of course, this is a misapplied name, as the true snow-bird (*J. hyemalis*), is quite different in size, plumage and habits. Both the larks and buntings are gregarious, and, though very often found together, I think the larks rather dislike the buntings, as I have seen them attack and drive out from among them scattering buntings which would alight among them to feed. The buntings are also about here called "winter geese," though I fail to see the resemblance. The name fits full as well as many nick-names to natural objects. Judging from my own experience, I am convinced that many good birds are lost through the mixed up knowledge of local gunners, their lack of interest and the great difference between them. I often get laughed at for trying to set them on the right track. They say, "Humph! Reckon they know something; guess they knowed birds afore I was born, when there was some." Still, I often convince these people and make a point.

Feb. 17.—A specimen of the wild cat (*Lynx rufus*), female, was shot at Essex, Mass., by Mr. Luther Clapp. This is unusual to find here, though they have been taken before.

March 8.—During a stroll to-day I took a robin (*T. migratorius*), and a chickadee (*P. atricapillus*). These last often make us visits in the city during winter—oftenest on mild days—and do much by their presence and cheerful notes to make us happy. Salem, Mass.

March 12.—A specimen of the dusky duck (*Anas obscura*), female. I notice this bird is universally called black duck. Salem, Mass.

March 31.—Three shore larks (*E. cornuta*) and one song sparrow (*Melospiza melodia*). Mr. Ober, whom your readers know as Fred Beverly, was with me. He also shot some larks. Salem, Mass.

April 2.—A specimen of the cedar bird (*Amphisp. cedrorum*), taken. This bird is also known as cherry bird and wax-wing. I have seen them stuff themselves with wild cherries and sit on a tree perfectly regardless of danger while persons threw a number of stones at them. Unless hit, or the limb whereon they sat was struck hard, they would not think of moving. They are most common in spring and fall, though many breed. Domesticated they make interesting pets, and will eat cake and ginger bread, as much as they can hold, about every half hour. Salem, Mass.

April 11.—Two purple grackles (*Quiscalus versicolor*) taken. I have seen row after row of garden peas, the pods hanging to the vines, open, and every pea taken out by these birds as clean as the host servant could shell them. This I have seen on Mr. Gregory's seed farm, in Marblehead. These birds are very common with us, mostly in fall, when they, with some other blackbirds, congregate in large flocks before going South. It also breeds. Salem, Mass.

April 14.—Bluebird (*Sialia sialis*), male, one of our earliest and most welcome visitors from the south, breeding and staying until November. Contests for bird houses between this bird and the swallows (*T. hirundo*) are very amusing. Salem, Mass.

April 23.—Red-winged blackbird (*Agelaius phoeniceus*), male, taken at Marblehead, Mass. This bird is very common about here, though, excepting when near its nest, it is quite shy. At North Beverly, near Miles River, they are numerous and not near as shy as at Salem. Why, I cannot say, but this is my experience.

(To be continued.)

MR. RIDGEWAY'S ORNITHOLOGY.—By some strange inadvertence, Mr. Ridgeway's Ornithological Report, referred to last week, was spoken of as one of the publications of Dr. Hayden's Survey. The error we hasten to correct. Mr. Ridgeway's work was done in connection with the Survey of the Fortieth Parallel (Clarence King, U. S. Geologist, in charge), and his report forms part of Volume IV. of the publications of that Survey. We have already referred to the importance and value of the work performed by Mr. King and his staff, and the present work is in no way behind previous publications in excellence. It deals chiefly with the bird fauna of California and the Great Interior Basin, and contains many new and interesting observations. Mr. Ridgeway will accept our best thanks for the volume sent us.

JUDGE CATON'S PARK.—Our readers will recall some interesting notes sent to us by Judge J. D. Caton, of Ottawa, Ill., concerning his domesticated wild turkeys. That gentleman, who is now abroad, has added to the extensive natural history collection in his private park by sending home a pair of black swans from Australia and two pairs of Hawaiian geese. That this is a highly satisfactory method of studying natural history Judge Caton's work on the "Antelope and Deer of America" abundantly proves.

A CURIOSITY.—We have received from Mr. W. Kellerman, of Aberdeen, Miss., an account of a curiosity in the shape of a deer's foot encircled by a ring of wood. A slip, cut from the *Aberdeen Examiner*, inclosed by our correspondent, will give our readers an idea of this odd combination:

"We were shown on Friday by Mr. Kellerman, the noted gunsmith of our city, a curiosity in the shape of a deer's hoof encircled by a pine knot, which, fitting around it like a ring, appears to have been worn for many years. The deer was killed by Mr. James Gillispie, formerly of this county in the piney woods near Winchester Station, on the M. & O. R. R. last fall, and the general impression is that the animal must have thrust his foot through the knot when quite a small fawn, and worn the strange appendage through all the succeeding years, rubbing it down to the ring that now encircles the bone.

CURIOUS MALFORMATION.—Mr. Eugene Thorne, of Thorne-dale, Dutchess County, N. Y., has shown us the skull of a common woodchuck, whose incisors have been bent and lengthened as shown in the accompanying cut. Naturalists

tell us that the malformation is not unusual; but it seems strange that the animal could forage sufficiently to keep himself fat and in as good condition as he was found to be when it was headed off from his burrow and pounced upon by Mr. Thorne's foxhounds.

BIRDS TOWERING.—*Vail, Iowa, Feb. 23, 1878.*—My experience regarding the towering of birds after being shot is similar to that of "T. S. S.," in *FOREST AND STREAM* of Feb. 14. I have occasionally shot prairie chickens, but more frequently pigeons, that would tower to a height of nearly 100 feet, each circle growing smaller as they ascended until they would suddenly drop dead. Also on several occasions I have shot prairie chickens that, instead of flying in a circle, would fly nearly straight up to a considerable height and then drop dead. Upon examining these birds I found they were usually shot in the eye or across the top of the head. E. B. B.

CORMORANTS IN CENTRAL NEW YORK.—Some time since we called attention to the fact that a cormorant (*Graculus dilophus*) had been captured by Mr. J. B. Gilbert, of Penn Yan, New York, and we have recently learned of the taking of another bird of this genus near Rochester, N. Y., the specimen being now in the possession of Mr. E. H. O. Griffin of that city.

A CARDINAL GROSBREAK IN CENTRAL PARK.—A city correspondent, "E. C. M.," writes that while walking in the Park on Sunday, March 17, he observed a number of early spring arrivals, among them the purple and rusty grackles, robins, bluebirds, warblers and song-sparrows; and a friend of unquestionable veracity saw a Baltimore oriole and catbirds in the Park last week. The most noteworthy observation of our correspondent was what his naturalist's eyes assured him was a cardinal grosbeak. He adds: "Now, is not this a very unusual occurrence? If the cardinal bird ever migrates as far north as this, was it ever known to be here in March?"

[Very unusual, no doubt, but not unparalleled, for Mr. E. P. Bicknell has, if we are not mistaken, captured this species in November and December at Riverdale-on-the-Hudson, and the writer once killed one in February on Manhattan Island, about two miles above the Central Park. The occurrence of *Icterus baltimore* so early is quite as surprising.—En.]

SPRING NOTES.—At Portland, Conn., woodcock, February 25; crow black birds, March 2; red-winged do., March 3; *Melospiza melodia* and *Passerella iliaca*, March 5; *Sayornis fusca*, March 7. The above are reported by Mr. J. H. Sage. At New Haven, Conn., *Gallinago wilsonii*, March 16; *Harporhynchus rufus*, March 20; this last about six weeks in advance of its usual time. At Hornellsville, N. Y., blue birds, February 28; red-winged blackbirds, March 2; *Spizella socialis* and *Ceryle alcyon*, March 3; these reported by "John." March 20, blue birds, downy woodpeckers and *Sayornis fusca* beginning to build; March 15, eggs of *Bubo virginianus* taken at East Hampton, Conn., by Mr. W. W. Coe.

—A friend sends us from St. John, N. B., under date of Feb. 25, 1878, the following note, which says: "Our winter has been unprecedentedly mild; continual soft weather and much rain. As an evidence of the mildness of the winter, a Mr. Kimball, of Grand Bay, near the city, while chopping in the woods last week, found a nest in the stump of an old tree with two young cross-bills in it, nearly fledged, alive and active.

HABITS OF RUFFED GROUSE.—In Connecticut my experience has been that, where ruffed grouse were hunted excessively and very often missed, they are much more inclined to tree; also, where foxes are plenty and disturb the birds very much, in all cases they will tree in pines or hemlocks, if there are any about; very seldom in any other, except when young—September and August birds—which we do not hunt in this State. W. H. W.

Lakeville, Conn., March 15.

ANOTHER OWL ON THE RAMPADE.—A Menomonee, Wis., correspondent writes:

"M— was walking through the woods, his black pup accompanying, when a large owl swooped at the dog three times. When M— turned to defend the dog, the owl made for him; but by a well directed blow from the right shoulder his owlishness was knocked into a cocked hat."

RED TROUT OR REDFISH OF OREGON AND IDAHO.—A fish under this name, found in various localities in Oregon and Idaho, appears likely to prove, from what we can learn, an undescribed species of the *Salmonidae*, as the characteristics of habit, color and other conditions are such as to exclude it from any reference to a known species; indeed, it is not impossible that it may constitute a special section of the family. Captain Charles Beudire, U. S. A., writes, under date of March 7, as follows:

"I heard about the red trout first in 1869, when stationed at Fort Lapwai, and saw specimens there salted down with heads and tails cut off. They form now an article of commerce in the mining camps of Florence and Warrens of Idaho, and parties visit the lake (Fayette) every summer and put up large quantities. The small streams running into the lake are said to be literally filled with them during the month of August and part of September. They are also found in Wallowa Lake, and I believe the fishing in that locality was the first cause of trouble between the Nez Percés and the whites.

"There would be no difficulty in getting specimens if I could only get away about that time. Perhaps you have correspondents in Grand Ronde Valley, Oregon; this is in the vicinity of Wallowa Lake, and they might be procured through some one there."

[We would call the attention of our correspondents in the West to this matter, with the suggestion that if specimens be secured they be sent to the Smithsonian for identification and for introduction into the mouograph of the American *Salmonidae*, which Prof. Gill and Prof. Jordan have now in preparation. They can be best preserved in alcohol, but the larger ones might be skinned and the skins properly dressed with arsenic or other preservative.

SPANISH MACKEREL.—With regard to the strange fish caught at Bayport, Florida, by a correspondent, to which reference was made in our issue of the 14th, we are informed by a note from Professor Gill that it was undoubtedly a *Cybbium maculatus*, or Spanish mackerel.

—Prof. Marsh, of Yale College, last week purchased from the Messrs. Lamson Brothers, of Maiden Lane, this city, a large and valuable collection of relics of an extinct race—pottery, stoneware, etc.—from graves in Chiriqui, Isthmus of Panama, received by a recent steamer. Prof. Baird, of the Smithsonian Institution, Prof. Tarry, of the Assay Office; W. C. Prime, Esq., R. L. Stuart, and others well known, had previously examined them with interest.

ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDEN, FAIRMOUNT PARK, MARCH 26, 1878.—One common seal, *Phoca vitulina*, purchased; one pig-tailed macaque, *M. nemestrinus*, born in the garden; one alligator, *A. mississippiensis*, presented; one herring gull, *Larus argentatus*; four sirens, *S. lacertina*, presented.

ARTHUR E. BROWN, Gen'l Supt.

Woodland, Farm and Garden.

THIS DEPARTMENT IS EDITED BY W. J. DAVIDSON, SEC. N. Y. HORTICULTURAL SOCIETY.

PEARS.

THE season for transplanting fruit trees is now with us, and indeed this operation, from the extreme mildness of the winter, could have been performed at any time during the last two months. The Pear is, without doubt, the favorite fruit of modern cultivators, and is a very different morsel for the palate than that which obtained two or three hundred years ago. It likes a good, deep, strong loam of a somewhat cool character and dry subsoil; and it must always be borne in mind that, in planting fruit trees (or, indeed, anything else for permanency) you are not planting a stake or fence-post, but should take out holes at least three feet in diameter, to enable you to spread the roots carefully, thus permitting the tree to develop itself to the best advantage. Give it a good chance for the first few years; if it grows too luxuriantly it is easy to curb its growth and throw it into fruit-bearing by judicious root-pruning. A mulching of salt hay or manure will be found of great service, especially during the first season, preventing evaporation, and keeping the ground moist and cool. Within the last thirty years the variety of pears has become almost endless, and a selection from the following may be of use to those who intend planting or adding to their collection of varieties:

Varieties Ripening in August and September.—Braudywine—A delicious variety of good size, vinous and full of sugary juice, grows well and fruits freely. Boston—This variety comes nearer the old White Doyenne than any we know of; an enormous bearer every other year. Bloodgood—A pear of decided character and of fine flavor. The tree is a slow grower, but of fine habits and a heavy bearer. Clapp's Favorite—A variety combining the qualities of the Bartlett and Flemish Beauty; tree very vigorous and a good bearer. Andrews—An old but thoroughly good pear, with oily skin, rich juice and delicate aroma. It is sometimes called the "Water Lily Pear," the skin baving the delicious fragrance of our Nymphæa. Adams—A fit companion to the well-known Bartlett, but of regular and handsome form, and a fine rosy cheek. It has a rich, vinous flavor, very melting, and keeps a long time. These may be considered the choicest of our summer pears, but the following are also good: Dearborn's Seedling, Tyson Hanners, Moore's, Cushing, Cabot, Collins, Buftum, Bartlett, Ontario, etc., etc.

October is our month, rich in fruits, and the grower must be very careful in his selection, unless he has plenty of space. In fact, it is hard to reject any, so fine are the sorts: Sheldon—This pear has a rich Bergamot flavor, rich juice, and is one

of the pears with which you never get satiated. It is of large size, a good keeper; and the tree is productive and beautiful, probably our best October pear. Pratt—This ranks nearly as high, but is of altogether different form from the preceding. But its excellence consists in its melting, sugary quality and juiciness rather than in its flavor. It is a very free grower and an abundant fruiter. Hull—Another enormously productive variety and very fine fruit, melting, sugary and rich, like the Doyenne. The tree is spreading, slightly pendulous, and of vigorous growth. Seckel—This variety, like the Bartlett, is too well known to need any description. Meriam—One of the most popular, though not one of the finest pears. If gathered in time it comes very near a first-class pear for excellence as well as every other quality. The tree is very vigorous and spreading. Other October sorts of good quality and general excellence are: Washington, Swan's Orange, Mount Vernon, Kirtland, Admirable, Oswego Buerre, Huntington, etc. For November, December and later, King-sessing takes the lead in earliness. It is a large, handsome pear, something like a medium Duchesse, with a yellow skin and red cheek, keeping a long time, and is of excellent quality. Abbott is a good pear, with a strongly pronounced almond flavor. It is a very beautiful sort, with waxy yellow skin and red cheek, of medium size and of a peculiarly upright growth. Howell—This is a fine pear, full of brisk sub-acid juice, refreshing, rich, and a really pretty fruit. The tree assumes a somewhat open irregular shape, and the branches, when loaded with fruit, nearly touch the ground. Fulton—This is one of our oldest American pears, but not yet extensively cultivated. The fruit is roundish, flattened, has a deep russet skin, like Beurre Bosc, and is nearly or quite equal to that variety in quality. Lawrence—A most melting, rich, sugary pear, of good size and clear lemon color at maturity, too sweet, indeed, for some pear lovers. The tree grows freely, and when well established produces heavy crops. Columbia—This is a strong grower, of spreading habit, and a good bearer. The fruit is large, in shape and appearance like a lemon, with a long stem, and is very juicy and refreshing, keeping well till February and March. Dana's Hovey—What the green gage is among plums, and the muscat among grapes, the Hovey is among other pears. It is not much larger than the seckel, and when gathered in October has a dull, greenish, quite uninviting look, but as it matures it changes to russet, and then to a rich golden hue, really charming to look at. They are more like huge drops of confectionary than pears, the mere cutting of one setting free the delicious aroma and perfuming the air. The tree is strong and stocky, a free fruiter, and the fruit ripening in December, continuing well into January. Other varieties of excellence will be familiar to our readers, as Duchesse, Beurre Bosc, Easter Beurre, Winter Nelis, Beurre Langelier, Glou Morceau, etc., which in succession run into the spring months with us, if properly kept. It is a curious fact, however, that with one or two exceptions, scarcely any of the pears mentioned will grow on the Quince stock. Some will grow for a few years and then stop, others will not budge a foot, therefore they must all be grown on the pear stock.

CALIFORNIA RAISINS.

RIVERSIDE, S. B. Co., Cal., March 14, 1878.

EDITOR *FOREST AND STREAM*:

I send you by to-day's mail samples of raisins—white muscat of Alexandria—taken from a twenty-pound box, one of seventy-five produced last fall from not quite three-quarters of an acre. They readily brought \$2 per box, taken at the vineyard. The vines planted in Riverside are five years old, and have been in bearing three years. The amount of raisins produced hereafter will increase rapidly from year to year. Through ignorance as to the method of curing, last year was the first in which the above satisfactory results were obtained. The samples I send you, like many others sent East, and which have excited considerable wonder, are a fair representation in size and quality of the crop in question. The method of curing adopted last year was as follows: Trays or platforms, three feet square (easily and cheaply made), are laid on the ground between the rows, and covered to the depth of a single cluster. The proper time for picking is ascertained when the grape has taken on a pale amber hue. After lying exposed to the sun on the trays for nearly two weeks, in the meantime changing to a beautiful purple, the bloom showing like the dust on a moth's wing, a spare tray is placed over the first in the row, and, pressing them firmly together, the whole is reversed, leaving the raisins—after the top tray is taken off—with the uncured sides exposed to view. The tray just spoken of is used to turn the next one in the row laden with fruit, and thus the whole production of the vineyard is turned in a very short time by two men, at a great saving of time, expense and preservation of bloom on the fruit over the old way of turning by hand.

The characteristics of this section of Southern California, which produce such favorable results in raisin production, are an extremely dry electric atmosphere, rich soil, and almost constant sunshine. But many sections in the lower counties rich in the above, are rendered almost worthless by lacking that fourth and most important element, viz., water. This, however, the "Riverside Land and Irrigating Co.," have secured by an elaborate system of irrigation, costing at present over \$250,000, but making available 20,000 acres of land which, formerly worthless, now readily sells for from \$40 to \$50 per acre. Although the orange is supposed to be the golden egg for Riverside, in the future the raisin bids fair to be a formidable rival.

J. D. H.

[The samples of raisins sent and received are marvelously fine; the bunches remarkably large, the fruit large and uniform in size, the flavor equal to any imported grapes we have ever eaten, though a trifle less sweet. Upon the whole we prefer the California grape, and, so long as the product is up to the sample, shall encourage home industry all that we can.—Ed.]

NEW YORK HORTICULTURAL SOCIETY.—At the regular monthly meeting of this society last Tuesday, Mr. Peter Henderson, of New Jersey, delivered an entertaining and instructive address on "City and Suburban Gardens."

POULTRY BREEDERS' ASSOCIATION OF TENNESSEE.—Encouraged by the liberal patronage of their first show, held here in February, the Association have determined to hold another one sometime in December, and as an inducement to breeders at a distance they intend giving larger prizes than at the first one.

THE FOUR-LEAFED SHAMROCK.

NEAR TWYMAN'S STORE, Spottsylvania Co.,
Va., March 20, 1878.

EDITOR FOREST AND STREAM:

In the issue of FOREST AND STREAM, of March 14, you tell us just enough of the shamrock to cause us, like Oliver Twist, to "ask for more." Is there not an old Irish superstition that whosoever finds a four-leafed shamrock has power to use it after the order of an enchanter's wand? 'Tis said also, I believe, they are only to be found growing where a mare has cast her foal. I am sure, Mr. Editor, that it is not without the province of one who delights us weekly upon such topics as fruits, flowers and plants, to give us, in connection with the real, some of the poetic conceits, which must ever be associated with things so beautiful. Who does not remember the old song—

"I'll seek the four-leaf shamrock
In all the fairy delts,
And if I find that charmed leaf,
Ah! how I'll weave my spells.
I'll fill the world with riches
And scatter bliss around,
And not a tear or aching heart
Should in the world be found."

I do not know if I quote correctly, for I write from memory, and after a lapse of 150 years; at any rate, it seems so long to me. I have found clover with four leaves. Is *oxalis acetosella* ever thus found. And now, Mr. Editor, if I have allowed my fancy and pen to get the better of my discretion, my only excuse is that, like an old dog, I only wished to open on a trail, which, however cold, might eventually lead to a find.

R. M. C.

The Kennel.

TO CORRESPONDENTS.—Those desiring us to prescribe for their dogs will please take note of and describe the following points in each animal:

1. Age. 2. Food and medicine given. 3. Appearance of the eye; of the coat; of the tongue and lips. 4. Any changes in the appearance of the body, as bloating, drawing in of the flanks, etc. 5. Breathing, the number of respirations per minute, and whether labored or not. 6. Condition of the bowels and secretions of the kidneys, color, etc. 7. Appetite; regular, variable, etc. 8. Temperature of the body as indicated by the bulb of the thermometer when placed between the body and the foreleg. 9. Give position of kennel and surroundings, outlook, contiguity to other buildings, and the uses of the latter. Also give any peculiarities of temperament, movements, etc., that may be noticed, signs of suffering, etc.

FIXTURES FOR 1878—BENCH SHOWS.

Baltimore Kennel Club's Show, Baltimore, Md., April 23, 24, 25 and 26. L. R. Cassard, Secretary.

The Westminster Kennel Club (New York) Bench Show, Gilmore's Garden, May 16, 17, 18 and 19. Dr. W. Seward Webb Secretary.

MASSACHUSETTS KENNEL CLUB—THE BOSTON BENCH SHOW.

IN a first article, written in Boston, we designated some of the prize winners, and added some brief description of the appearance of the leading dogs, giving some idea of the general disposition of the show. Where many really good animals are shown, and there can be but few prize winners, the owners of those dogs who have not secured distinction are always more or less dissatisfied. A bench show is, above all, a place of heart burnings and of bitter disappointments. It must be stated that unless directly owing dogs, representatives of the press, visiting bench shows, get in time more or less tired with the champion imported classes. Such dogs, though admirable of their kind, revolving as they do from show to show, cannot have any claim to novelty. We must confess that it is in the get of such leading dogs that we see objects of greater interest. The champion dog A, for instance, when pitted with the champion B, having been collar to collar with one another in Memphis, St. Louis and Boston, during the last month or so, may be likely within a few weeks to enter the lists afresh in Baltimore and New York. Until newer importations are made of fresher or more original stock, or unless we put in the contest our own native dogs and challenge all foreign dogs, these competitions of imported champions must be more or less trite and passably monotonous. It is not expected that a judge can stultify himself. A judge having for very good reasons (conscientious ones, no doubt,) given a dog a first prize in the West, there is every reason to suppose, unless there be some marked change in the condition of the dog, that the same judge will give the same dog a prize in the East; just as he would be likely to place the blue ribbon on the identical animal if within a month or so the dog was shown in San Francisco. Of course there is a way out of all this. The position of judge is no sinecure. If it brings its honors it also carries along with it duties which are onerous to a degree. "Oh! that mine enemy were judge at a bench show!" might be used instead of a much hackneyed phrase. It may be very trying both to an impatient public anxious to know who wins, as to the owners of dogs, but it seems to us that for all future bench shows we will want for sporting dogs at least three judges for all the leading classes, who must compare notes and make their decisions from the individual points all have taken; otherwise we shall always have objections. For the non-sporting animals, unless the classes of dogs were too large, one judge might suffice. A divided responsibility in such a case would undoubtedly be better for all concerned. We particularly disclaim any intention to find the least fault with Mr. Davidson. This gentleman showed the utmost attention to all details, was most careful and painstaking in all his examinations, and, as far as our opinion goes, ninety times in a hundred was perfectly correct in his awards, and we shall

abide by his decisions in the Baltimore show with the utmost respect.

In the special classes for the best kennel of English setters, Mr. L. H. Smith's Leicester, Paris, Pearl, Clip, Temple Bar and Lass o' Gowrie were awarded the prize. These are all very fine dogs. Opposed to them was Messrs. Nesbitt's kennel, of which Rock was the chief. Rock has a superb head, but perhaps not as good in his hindquarters. Dora is a superb bitch, and so is Zilpha, a lemon and white, out of Rock and Belle. Of Messrs. Beebe Brother's kennel, two of these, Don and Hassey, by Mr. Morris' Lark, showed all the finest traits of their very good sire. In Class B, the best kennel of Irish setters, the cracks of the St. Louis kennel stood well to the front. Berkley is undoubtedly Elcho's best progeny. Biddy was in fine form. In fact, all of them, from having come so far and looking so fresh, reflect great credit on Mr. Whitford, the manager of the St. Louis Kennel Club. It was, we are inclined to think, an easy victory over Scout, Rattler and the rest. In Class C, best kennel of Gordon setters, Mr. Farrar's Rupert and Rapp were winners. Mr. James R. Tilley's kennel, of Locust Valley, L. I., deserves more than a passing mention. Whip and Ring are very choice animals. There was one bitch, Dream, of the same stock, the property of the Baltimore Kennel Club, No. 282, a V. H. C., which, when worked on Boston Common in such good company as even Leicester, showed the most sprightly form, with superb action and speed. Only a month in the hands of her trainer, Mr. Kelly, Dream has shown not only her superb natural instincts, but her docility; a more promising Gordon bitch we never saw. For the best kennel of pointers, Mr. Edmund Orgill's Flake, Rush, Rose, Ruby and Belle were good winners. Of the beauty and game points of Rose we have already made particular mention. Mr. G. A. Strong showed his fine lot, of which that good old dog Pete was a fine representative. In the Neversink Lodge kennels, Mr. A. E. Godfrey had quite a string of remarkably good liver-and-white dogs, some of which, we are pretty sure, will go to the Pacific Coast on orders. It is to be regretted that in this class, D, the pointers belonging to the Westminster kennel did not show. It was in Class F, best English stud dogs, that a great deal of interest was taken, for many of Mr. Morris' Lark's progeny had been found in Boston. Paris, the great crack, the superlative, was shown. Paris won, and Strathroy was victorious, with Boston and New York much discomfited. In Class G, Mr. Jarvis was alone with Elcho, and in Class I, Mr. Orgill won with Flake. Mr. Smith, over-burdened now with prizes, scores one more with Pearl as a setter brood bitch, as does Mr. Develin with Moya as an Irish setter bitch. Mr. Tileston won with Lou, and the Baltimore kennel with Lily for a first-class pointer bitch.

Casting now a retrospective view on the champion pointer dogs, we notice how really good all the animals were, when, with the exception of one, all received either a V. H. C. or an H. C., and only one had a C. awarded to him. We have been asked about Snapshot. Quite a number of letters have already reached us with these questions: "Where was Snapshot?" "Did Snapshot really have the mange?" "How do you know that Snapshot had the mange?" We must state that, fully prepared for these queries, we went with a leading member of the Massachusetts Kennel Club to Watts, the dog infirmary man of Boston, and there we saw poor Snapshot quite a mangy dog, and under treatment for it. In our former brief summary we had no opportunity of speaking of Mr. Forsyth's Di, a handsome orange and white, the winner of the native English setter bitches. In the English setters, class 5, Lelaps, black, white and tan, of Purcell Llewellyn Kennel, was as handsome a dog as could be found in the show. The peculiar marking of his head, white with blue ticks, and the tan over his eyes, proclaims him as one of the true Belton's. His sister, Diana, in the English setter class, took with Lelap first prize. Mr. Mercillott's Pet and the Baltimore Czarina were all very close. In the pointer puppies, we have before referred to the fine lot shown by the Neversink Lodge kennels, more promising puppies we never saw. The time for a *furor* in setters is fast approaching.

In the classes judged by Dr. Twaddell the Chesapeake Bay dogs were quite distinguishable for their excellence, the Baltimore Kennel Club winning with Rob, and in bitches Mr. Hammond taking the prize with Rose. Of clumbers, as fine a specimen as we ever saw was Mr. Poole's Roney. In cocker spaniels, Fanchon II. was a thorough beauty. Mr. Pownall, of Christiansa, showed his heagle, Bess, a black and tan, which was by long odds the best dog in the lot. In dachshunds, Mr. Leisler's Puck and Nellie won, and admirable dogs they are. Gisela, of the greyhounds, taking the first prize, and Charlie, the winner of the second prize, were first class dogs. Of Scotch deer hounds, though there were few, two won, and one more was commended. Lupus is as fine a specimen of this fine breed as we ever saw. Of mastiffs, the show was a superlatively good one. Mr. Austin's Jack would have done credit to an English bench show, as would have done Ross. These were noble dogs, and for tramps better than any legislative enactments. Of St. Bernards, neither Rodney nor Lion would have been our choice. St. Bernard judging is a very much mixed thing in the U. S. We are going away from the true Barry form, and the monks of St. Gothard would grow wild did they see some of the decisions. Of Newfoundland, the whole line was good. Of collies, Mr. Harlow's Dan and Mr. Hammond's Capt. Jack, of the dogs, and Jessie, among the bitches, also belonging to Mr. Hammond, and another Jessie, belonging to Mrs. E. Ward, were of fine

type, and worthy of the prizes. (Why can't we have a collies' field trial some day?) In the classes judged by Mr. Scott, this gentleman seemed to have a very thorough knowledge of his duties. If the animals in many cases were not up to his high English standard, still he acknowledged that there were many fine specimens in the toy classes. In Scotch terriers and Dandie Dinmonts, as no pure dogs were in the show, no prizes were given. This judgment gave rise to some little discussion, but Mr. Scott was perfectly right. We may call a dog by any name we please, but that does not give him the peculiar points of a breed. In toy terriers, Mr. Kisternmann, of N. Y., and Mr. Cross, of Boston, divided the prizes. The money for these prizes, if paid in silver, would far outweigh their dogs. Miss Chickering's Punch, a nice dog with a comic mask, took the blue, and the famed Sambo had a V. H. C.

We have again to offer to the gentlemen of the Massachusetts Kennel Club our congratulations on the most successful character of their bench show, and to thank them for numerous courtesies shown us.

LIST OF AWARDS.

DIVISION FIRST—SPORTING DOGS.

Class 1—Champion English Setter Dogs—First prize, 5, P. H. Bryson, Memphis, Tenn.; Gladstone, V. H. C., 3, P. H. Morris, N. Y.; Lark, H. C. same owner, Czar, 1. C. M. Carleton, Norwich, Conn., Dash.

Bitches—1st prize, 7, D. T. Charles, Albany, N. Y., Boso, V. H. C., 6, same owner, Nina 10, L. H. Smith, Strathroy, Ohio; H. C., Grace, 8, E. F. Mercillott, N. Y.

Class 2—Champion Irish Setter Dogs—1st prize, 12, St. Louis Kennel Club, Lou 11, V. H. C., 13, D. Wm Jarvis, Claremont, N. H., Elcho.

Bitches—1st prize, 15, St. Louis Kennel Club, Biddy, U. C., 16, E. D. Brainard, Albany, N. Y., Fanny; 17, J. E. Develin, N. Y., Moya.

Class 3—Champion Gordon Setter Dogs—1st prize, 22, W. J. Farrar, Goldsmith Kennels, Toledo, O., Rupert, V. H. C., 18, S. C. Du Bois Wagstaff, Babylon, L. I., Kent; 19, Sam Bradstreet, Jr., Dorchester, Mass., Dinks, 20, J. Marbio, Worcester, Mass.

Bitches—1st prize, 26, W. J. Farrar, Toledo, O., Fan, V. H. C., 24, W. M. Tileston, New York, Lou, H. C., 25, Dr. J. H. Wright, Boston, Gipay.

Class 4—Champion Pointer Dogs—H. C., 27, W. G. B. Shelton, Auburndale, Mass., Fisco, C. 28, J. Walter Boutwell, Boston, Dou, H. C., 29, V. Ward, Woodville, Mass., Semit, V. H. C., 30, G. A. Strong, West Meriden, Conn., V. H. C., 31, Edmund Orgill, Memphis, Tenn., Flaco, V. H. C., 32, Edmund Orgill, Rush, V. H. C., 31, E. O. Sterling, St. Louis, Mo., Sleaford, 1st prize, 33, Westminster Kennel Club, N. Y., Senation.

Bitches—H. C., 37, Henry S. Hall, Worcester, Mass., Kit, V. H. C., 38, Joseph S. Fay, Jr., Boston, Gipay, V. H. C., 39, John Hadley, Worcester, Mass., Bull, 1st prize, 40, Edmund Orgill, Memphis, Tenn., Rose.

Class 5—Imported English Setter Dogs—V. H. C., Isaac Fieko, Worcester, Mass., Wagner, 1st prize, 43, Franklin Sumner, Blue Hill, Milton, Mass., Lelaps, H. C., 44, T. Anslin, Strafford, Conn., Bronte, H. C., 50, Justus Von Lengkerke, New York, Jersey Duke, V. H. C., 51, Lincoln & Hillyar, Frank II, H. C., 52, J. W. Wilson, South Boston, Scott, 2d prize, 61, T. H. Class 42—Poodles, Dogs or Bitches—1st, 650, William Hodnett, East Boston, Carlo. H. c. 651, W. T. Hord, Charlestown, Mass., Dot. 1st, 655, James Carroll, East Cambridge, Mass., Pompey.

DIVISION THREE—SPECIAL CLASSES.

Class A—Best Kennel English Setters—1st, 676, L. H. Smith, Leicester, Para, Pearl. Clip, Temple Bar and Lass o' Gowrie.

Class B—Best Kennel Irish Setters—1st, 678, St. Louis Kennel Club, Loo II, Berkley, Sting II, Elcho II and Biddy.

Class C—Best Kennel Gordon Setters—1st, 682, W. J. Farrar, Rupert, Idaho, and others.

Class D—Best Kennel Pointers—1st, 686, Edmund Orgill, Memphis, Tenn., Flake, Rush, Rose, Luby, Belle.

Class F—Best English Setter Stud Dogs—1st, 692, L. H. Smith, Paris.

Class G—Best Irish Setter Stud Dogs—1st, 694, Dr. Wm. Jarvis, Elcho.

Class H—Best Gordon Setter Stud Dogs—1st, 696, Jerome Marble, Grouse.

Class I—Best Pointer Stud Dogs—1st, 697, Edmund Orgill, Flake, with Rush and Rose.

Class J—Best English Setter Brood Bitches—1st, L. H. Smith, Pearl.

Class K—Best Irish Setter Brood Bitch—1st, John E. Develin, Moya.

Class L—Best Gordon Setter Brood Bitches—1st, 709, Wm. Tilton, Lou.

Class M—Pointer Brood Bitches—1st, 714, Baltimore Kennel Club, Lilly.

Class N—Foxhounds, Not less than two couples—1st, L. P. Bartlett, Arlington, Mass., Lion, Jack, Hunter, Fannie.

Class O—Mastiffs, Dog or Bitch—1st, A. W. Austin, Boston, Jack.

Class P—St. Bernards, Dogs or Bitches—1st, 734, Arthur H. Nichols, Boston Highlands, Mass., Jack.

Class Q—Pugs, Dogs or Bitches—1st, 740, Miss Chickering, Boston, Punch.

Class R—Best Pair Irish Setters, Dog or Bitch—1st, 741, St. Louis Kennel Club, Lou II and Berkley.

Class S—English Setter, Dog or Bitch, Native or Imported, having the handsomest head—1st, 762, J. & R. B. Nesbitt, Cambridge, Mass., Rock.

Class T—Best Setter of any Breed, Dog or Bitch, Imported or Native—1st, 775, P. H. Bryson, Memphis, Tenn., Gladstone.

Class U—Best Field Spaniel, Dog or Bitch, either Clumber or Cocker—1st, 779, E. W. Davis, Providence, R. I., Fanchon II.

Class V—Best Brace Beagles—1st, 781, Arthur Talbot, Lead-Race.

Class W—Best Pointer of any Weight, Dog or Bitch—1st, 699, Westminster Kennel Club, New York, Sensation.

Class X—Best Native Setter Puppy of any Strain, Dog or Bitch—1st, 803, Henry L. Kingsley, Stoughton, Mass., Bessie B.

Class Y—Best Skye Terrier, Dog or Bitch—1st, 806, Geo. M. Gale, Boston, Flossie.

Class Z—Best Blenheim or King Charles Spaniel—1st, 809, S. K. Hindley, Worcester, Mass., Lady, with three pups.

BALTIMORE BENCH SHOW.—This show, which takes place April 23, 24, 25 and 26, promises to be the finest display of the kind ever seen here. The building selected for this exhibition—Masonic Temple—could not have been better, as the hall is well lighted, and easy of access from any part of the city, and splendidly adapted to the purpose. The number of entries promises to be very large, and from appearances the Maryland Kennel Club will have no cause to regret their enterprise. THAYMOSE.

DOGS FOR THE BALTIMORE BENCH SHOW.—The Adams Express Company will carry dogs from New York to Baltimore, for the bench show, at three dollars per 100 pounds or less and return them free. Dogs must be boxed and prepared in all cases. If enough dogs are sent at the same time, a special car will be provided for their transportation. The first eight cubic feet are considered as taking the bulk of a hundred pounds and will be charged as such. Every additional four cubic feet count as 100 pounds more.

WESTMINSTER KENNEL CLUB.—Mr. Charles Lincoln informs us of the assured success of the coming bench show in New York. The managers have determined to limit the number of entries to 940 dogs. We beg to acknowledge catalogue of prizes, etc., which the crowded condition of our columns prevents our publishing in this issue.

NATIONAL AMERICAN KENNEL CLUB.—By virtue of authority conferred by Article 5 of the constitution and by-laws, I hereby call a regular meeting of said club at New York, May 16 next, at 12 M. The secretary will give the members the requisite notice of objects of meeting. Notice of the place of meeting will be given hereafter and be posted in the Hippodrome during bench show of Westminster Kennel Club. E. H. LATROFF, Pres't. N. A. K. C.
Springfield, Mass., March 20, 1878.

A VISIT TO THE EDINA KENNEL.

CYNTHIANA, Ky., March 18th, 1878.

EDITOR FOREST AND STREAM:

The recent bench show at St. Louis recalls to my mind a visit I made to the kennel of Jessie Sherwood, at Edina, Mo., last fall, while shooting in that vicinity. I consider the kennel a model establishment, and for cleanliness, neatness and general convenience it surpasses any I have seen. The grounds are quite spacious for the purpose, comprising an enclosure of about two acres of dry and rolling ground, part of which is covered by a grove of natural shade trees. The whole is enclosed by a high, tight board fence. Along one entire side are arranged the kennels, a continuous building, divided by close partitions into roomy and airy apartments—those intended for a pair of dogs being about 10x12 feet, with eight-foot ceilings—others are more roomy still. The sleeping bunks are placed about two feet above the floor, and are supported from the wall, so that underneath they are entirely clear of props or supports, or anything that can interfere with a free use of the broom in sweeping out. Adjoining the kennels on a side running at right angles with them are the sleeping apartments of the attendants and the kitchen; the latter is furnished with a large stove and boilers for the preparation of the food for the dogs. The fence and entire range of buildings, inside and out, except the floors, are neatly whitewashed, and everything is kept scrupulously and rigorously clean—the effect of which was apparent in the healthfulness and good appearance of the dogs, young and old.

Mr. S. took much pride and delight in showing me his stock, which consisted of more than fifty sporting dogs of all kinds and ages—setters, pointers, spaniels, retrievers, foxhounds, beagles, fox-terriers, etc. First and prominent among the setters was the imported champion Rupert—black and tan Gordon—a noble and handsome animal who fully deserves his title of "Champion." Another beauty was Pride of the West, a scion of Pride of the Border, a remarkably fine dog, liver and white, who was first at St. Louis in 1876 and 1877. Among the bitches were the red Irish Fanchon and Carrie II., the latter was third at the Field Trial at Hampton, Iowa, last fall. Bluc Dash, a roan dog, who is pronounced as "good as they make 'em" in the field. Among the pointers I noticed Sancho, imported, winner of ten prizes in England and America; he is a finely proportioned liver and white dog, of the lesser breed of pointers. Caesar, a small liver-colored pointer, I know from experience to be as good a dog as ever was shot over; he was a winner at Chicago when a year old. Among the bitches were Dream and Jule with their litters of promising looking pups. The imported clumber spaniels Flax and Florence, I admired very much; I perceive they were both winners at St. Louis, this month. Also among the fortunate ones at St. Louis this time were the beagles Lee and Lillie, which I also saw during my visit, and thought them little beauties—but enough, suffice it to say that I was highly pleased and well-entertained by that prince of good fellows, Jesse Sherwood. J. A. HENSHALL, M. D.

COL. JOHNSON'S FOX-HOUNDS.

NASHVILLE, Tenn., March 26.

EDITOR FOREST AND STREAM:

As the weather yesterday was so very fine, the sun so bright and the air so balmy, I was thinking how very agreeable a drive in the country would be, when, to my delight, my friend Marsh Pinchard, Esq., drove up behind his favorite horse, Mike, and proposed a visit to Col. W. H. Johnson, at his farm, about seven miles north of this place. I accepted the proposition and away we went. We crossed the Cumberland River over the Suspension Bridge, and took the Galatin Turnpike, which passes by the Colonel's farm. The road is an excellent one, and the country on both sides of it is as fine for farming purposes as any there is in Middle Tennessee, and as highly cultivated. The farms along this road are not very large, but highly improved, many of them having magnificent residences upon them. About three miles out we passed upon our right the Davidson County Asylum for indigent men and women. The site is a handsome one, and the grounds about it beautifully laid out. A mile or so further on, upon the left, is the national cemetery, where some 12,000 Union soldiers are buried. At last, after a delightful drive of an hour, we reached Col. Johnson's farm, one of the finest improved places in the country. We were fortunate in finding the Colonel at home. He received us in the most kind and hospitable manner.

The name of Col. W. H. Johnson is well known from Maine to Florida as an authority on all matters pertaining to thoroughbred stock, particularly horses and hounds. He has no thoroughbred horses on his place at present, but he has the finest pack of fox-hounds in this part of the State. The dogs have been bred with great care, their pedigrees being traceable back for thirty or forty years. Some of them are oak-half and some seven-eighths, English bred. He has seven couples, which are as handsome specimens as can be seen. The Colonel shows even in the names of some of his dogs his great weakness for the blood horse, his favorites being called Harry Bassett and Tom Bowling; the others are named, respectively, Bramble, Jack, Peter Cooper, Phil, Pointer, Sandy, Doria, Minnie, Dolly, Kitty Lou and Zoo Zoo, puppies, and Lily: the last is of the Gold-Dust strain. They are of different colors: Bassett and Bowling are white with very dark tan spots; Phil, Sandy and Doria are red; the others are white, with yellow and white and black spots; they are not quite so heavy as the pure English hound, but Col. J. thinks they are faster. Their voices are very fine, as I had an opportunity of judging while they were chasing some rabbits about the fields in the afternoon.

The Colonel is an indefatigable huntsman, as the evidences in the shape of scalps and brushes of this year's take, which he has hung up on his piazza, will prove. This winter past his pack caught thirty-one foxes—twenty-six gray and five red ones. He greatly prefers chasing the gray fox, because there is more sport in it. The red fox, as soon as frightened by the sound of the huntsman's horn or by the dogs, before they get his scent, starts right away in a straight line, and will often run eight or ten miles without stopping; and as the country is too rough, the fences too high and the farmers objecting to riding across their fields, if the dogs should get upon such a trail they run clear away, and the huntsmen lose all the sport. Whereas the gray fox, when uncared for or started, tries to evade the dogs by doubling and turning, and running from one cover to another, thus allowing the huntsmen an opportunity of witnessing the chase from some elevated place, or for those who are well acquainted with the country to dodge about from point to point, and thus keep the hounds in sight the greater portion of the time. Next to following the hounds, nothing pleases Col. J. more than to relate anecdotes of scenes connected with hunting. Of these he gave us quite a number. He also stated one or two peculiarities of the hound; one was that a pack of hounds would never fight or interfere with a strange hound that might be added to the pack, but that with any other breed of dogs they would not only fight when first brought into contact with them, but would never become reconciled to him. Another was that a thoroughbred fox-hound would not kill sheep. After a first-rate dinner and a most enjoyable day, we bid good-by to Col. Johnson and returned to town. J. D. H.

THE ROSE TREE FOX HUNT.—Our thanks are due to this fine club for a copy of their constitution and by-laws. We would call particular attention to an admirable description of the Hunt and its members, kindly furnished us by a leading fox hunter, which we shall print in our next issue.

KENNEL REGISTER.—Mr. Arnold Burges announces that the "Kennel Register" will be placed in the printers' hands about the close of May. We sincerely trust, now that Mr. Burges' editorial labors have drawn to a close, that this long-expected book will not be delayed in the mechanical part. To those numerous inquirers of the FOREST AND STREAM AND ROD AND GUN, as to pedigrees, we pray them to have a little more patience.

CURSORY JOTTINGS BY A STRAY DOG.—A dog in Cambridge, Mass., leads policemen to the spot where drunken men are lying, and in that way saves many lives which would otherwise go to the dogs, and stay..... They have been attempting at Bergen Point, N. J., recently to test the superior brutality of dog and man. A brute of a dog made an unprovoked attack upon a little girl, seriously injuring her. Thereupon a masked mob of human brutes, headed by a man who dispenses religion on the Sabbath, paraded the streets at night, demanded all dogs of their owners, and killed them on the spot. Some very valuable animals fell a prey to the fury of the rioters. Legal proceeding are to be instituted for the recovery of damages..... The failure of another New York bank reminds me that a bank in Massachusetts was protected from burglary the other night by a faithful watch-dog..... What is the relation of a catastrophe and a dogmatism? Ans. A catastrophe is serious—Sirius is the dog star—the dog's tar, if his bark be on the seas, may be a mate—which the same is a dogmatism—Q. E. D..... A Stamford, Conn., puppy has been adopted by a hen; follows his feathered foster-mother about,

responds to her cluck! cluck! and nestles under her wing at night.....I heard not long since of a dog in Wisconsin whose exploit, narrated in the *Wisconsin State Journal*, found a place in my note-book. An amendment was up in the Legislature of that State to prohibit all hunting with dogs:

"While the amendment was under discussion, a large dog, evidently smelling trouble in the breeze, determined to come to the rescue of his race, and made his appearance in the assembly chamber, and placed himself in the main aisle in front of the speaker's desk, and near the introducer of the amendment so thoroughly calculated to interfere with the rights and pleasures of dogs. By a process of gracefully wagging his tail, and looking into the members' faces with a pleasant countenance, the desired effect was produced, and the aggressive amendment was killed."

DASH—*Jackson, Miss., March 27.*—Did you ever see a dog back out from his point on a covey of birds for fear of flushing when his master was some distance off? If so, did you ever know a dog to habitually back out from a covey of partridges (*Ortyx virg.*), when not in sight of his master, come to him and tell him—yes, tell him I as well as a pair of expressive hazel eyes and a crouching attitude can tell—and immediately go back and find the birds again? If you have known a dog to do that on partridges, have you ever known one to do so on snipe? What is more, back out from his point on one or more snipe, but never from a single partridge. There is no question about understanding Dash if you have ever seen him do it once. Dash will come back in the same manner when flushing a single bird, or a covey rises wild in the woods, not allowing the dog to come to a point. I can instantly tell that the birds are gone. Dash, instead of going back carefully, ranges rather wildly, glad, I suppose, to have gotten off without a scolding, which he thought to be in store for him.

Dash does not like water. Even in summer he never indulges in a voluntary swim. It would have done you good to see him retrieve a teal out of a pond, round the edges of which the water had congealed. Dash is a splendid retriever. He will bring a crippled bird without rumpling a feather. And with what delight he brings them in! I have never known him to deliver a bird to any one except myself. He will swim a creek with the bird in his mouth rather than fetch it to the friend on the same side with him. He is the dog who, when four and one-half months old, pointed as steady as he does now. Dash would not bring ducks at a bench show, nor is he anything extra in the field; simply a good average dog with a high order of intelligence.

Yours truly, GEO. C. EYMICH.

A VERY CONSCIENTIOUS DOG.—The following letter is from a Philadelphia correspondent. His dog is certainly a very intelligent animal. She wishes, as far as is possible, to accurately locate the game which she scents. We have known of similar cases:

Nothing several very interesting accounts of the peculiarities of dogs mentioned at different times in the *FOREST AND STREAM* and *ROD AND GUN*, and being much interested in the same, I am constrained to contribute the following on which I would very much like to have your opinion. In my kennel I have a pointer bitch which came into my possession after having been trained. She is thoroughly broken, has a perfect nose and is under control at all times, and I have never known her to pass a bird, although last season was my first experience with her. Her peculiarity is this: On a windy day, when she makes a point, she will wait until you get within ten feet of her, when off she starts, making a complete circle around the game, keeping her head turned toward the centre. On arriving at the place from which she started she makes another stand, when you can work her without any further difficulty. It never happens except when the wind is blowing, and never, to my knowledge, has she in this circus performance disturbed the game. Can you give any explanation? or have you ever heard of a similar case? G. K. M.

—Mr. William Vie, of St. Louis, requests us to state that at the St. Louis Bench Show his dog, Vance, was not entered for competition.

—George E. Poyneer, of Clinton, Iowa, claims the name of Boston, for his red Irish setter dog pup; color, deep red, white frill. Born December 15, 1877, out of St. Louis Kennel Club's Duck (formerly E. F. Stoddard's), by Stoddard's Bob. Bob and Duck are grand specimens of their class, as their many winnings indicate.

TENNESSEE—*Columbia, March 25.*—Fanny, an imported English setter bitch, the property of a negro man, was killed by a drunken countryman who had a dislike for the negro. He called the dog to him and cut her throat with his pocket-knife. Fanny's loss will be felt by sportsmen, as she gave them fine dogs. VAL.

Sea and River Fishing.

FISH IN SEASON IN APRIL.

Speckled Trout—*Salmo fontinalis*. Land-locked Salmon—*Salmo gloveri*. White Perch.—

THE OPENING OF THE TROUT SEASON.

MR. EUGENE G. BLACKFORD has worked miracles this year in his trout exposition. This idea, novel in its character, invented, if we may call it so, by Mr. Blackford, only dates from some years back. The Treasurer of the American Fishcultural Association conceived the idea that two ends might be accomplished by a trout show. Firstly, it would act as a stimulant to the breeders of fish, and secondly, it would educate the general public in regard to what is certainly the most beautiful of all the varieties of fish. Why should we not commend those who, dealing in articles of food, bring into the business proper taste as to the display of their business? Before Mr. Blackford's time food in Fulton Market was dumped on stall and counter; now, dealers in our great marts where food is sold are commencing to vie with one another in the neatness of their display. No end of good food is ruined in New York from the careless way in

which it is handled. The lesson learned in Fulton Market in this famous trout display will have its good effects.

There never was such a superb show as this one. Exposed on marble stands, the proscenium, as it were, of a fish theatre; for a background was a huge tank swarming with trout. Of varieties of trout, these were endless. Mr. Blackford, for months beforehand, had been in communication with every trout raiser in the country, and on the stand were fish from all possible localities. England, Ireland and Scotland had furnished their quota. In examining the innumerable varieties of fish having wide divergencies of color, though the forms all more or less approach to the same type, a person with the least insight into the general effects of the domesticity of animals, is struck with this idea—to wit: that trout when cultivated, just like pigeons or dogs, though starting from one main type, through the agency of man, are prone to form certain new combinations first appreciable in color, and quite likely, in time, to be manifest in form. Let us, dropping the speculative, now get to the actual facts. The large tank was filled with live trout raised by Mr. H. D. McGovern. Mr. McGovern, a leading member of the Fishcultural Association, raises his trout almost in Brooklyn. Of dead trout, Messrs. E. H. Seaman, of Ridgewood, N. J.; Thomas Clapham, of Roslyn, L. I.; A. A. Anderson, of Bloomsburg, N. J.; H. T. Donsman, of North Prairie, Wis.; J. D. Brodhead, of the Delaware Water Gap; Ira Hoyt, of Halsey Valley; G. W. Thompson, of Sag Harbor, L. I., were among the many contributors. Such famous breeders as Livingston Stone, Seth Green and R. B. Roosevelt had also sent their cultivated fish. Of wild trout, few streams within five hundred miles of New York were there that had not sent their wild fish, trout from the Provinces being in abundance. Even anglers had commenced fishing a day or so before in other States where the close season is over sooner than in New York, in order to send in specimens to Mr. Blackford. For one single man to do all the talking and make the explanations was impossible, and accordingly, Mr. Fred Mather acted as *cicerone*, and, perhaps, there is not to be found in the United States a gentleman more familiar with wild and cultivated trout than is this leading fishculturist. As to the crowd, if it had been an exhibition of diamonds at Tiffany's it could not have been more largely attended. All day Monday, Tuesday and Wednesday the passage-way in Fulton Market was crowded, the ladies being present in large force. Mr. Blackford had numerous Ferguson jars on exhibition, where young trout and salmon, hatched out by him, could be seen. Such shows, quite unique of their kind, belong essentially to New York, and we doubt if such exhibitions could be made the same objects of interest anywhere out of the great Metropolis. We must highly applaud the good sense which dictates such a trout show, as it is one of the best methods of propagating fish culture and explaining its advantages to the masses. Certainly if trout, a most difficult fish to rear, can be raised in large quantity, why cannot the more ordinary fish in use be grown even on a more extensive scale? We have, then, in this hasty description, touched but little on the esthetic portion of such an exhibit, only endeavoring to show its usefulness.

To be very practical, then, we had the good fortune to be one of a tasting committee, of which Captain Mortimer and Mr. Fred Mather were among the judges. The flavor of the cultivated trout has been doubted as to its delicacy. There were passed in solemn review under the fork of the tasters, fish raised by Mr. Thomas Clapham, of Roslyn, L. I.; by Mr. Fenton, of Pequonnock, Conn.; by Mr. H. D. McGovern, of Brooklyn; by A. Jackson, of Foster Meadows; by Ira Hoyt, of Halsey Falls; by G. W. Thompson, of Sag Harbor, and the real, true, original wild trout, caught by Mr. J. D. Brodhead, of the Kittatinny House, Delaware Water Gap. The cultivated trout of Mr. McGovern's breeding were found to be of two different colors—white and pink—and were wonderfully fine as to flavor. Mr. Thompson's Sag Harbor fish were equally good, as were Mr. Clapham's fish. The Clapham fish are not fed on liver, but on small fish and clams. In fact, all the fish were excellent, and no superiority could be claimed by the wild trout.

Whether in the season of 1879 Mr. Blackford will surpass this exhibition, remains to be seen. It is hard to imagine how he could make a more wonderful trout display.

As has been noticed before in the *FOREST AND STREAM* and *ROD AND GUN*, the English fish had that purple gleam which Rolfe, the English artist, invariably gives his fish. The English trout were in shape or appearance very similar to our own, save as to color. The Blackford trout show will continue, we suppose, throughout the week, and the leading ichthyological event of April will be talked about and looked at for some time to come.

FISH IN MARKET—RETAIL PRICES.—Our quotations are as follows: Striped bass, 20 cents; large do., 15; smelts, 15; blue fish, 15; frozen salmon, 30; green do., \$1; California, 50; mackerel, large, 20; mackerel, small, 12½; Southern shad, 30 to 50; native, 00 to 75; Connecticut River, \$1.50; white perch, 15; Spanish mackerel, 35; green turtle, 15; frost fish, 6; halibut, 15; haddock, 6; codfish, heads off, 8; do., heads on, 6; black-fish, 15; Newfoundland herring, 6; flounders, 10; do., small, 6; eels, 18; lobsters, live, 8; do., boiled, 10; sheepheads, 25; turbot, 25; scallops, \$1.50 per gallon; soft clams, per 100, 30; do., large, 60; whitefish, 15; pickerel, 15; salmon trout, 15; Canada brook trout, 25; Long Island do., \$1.

First Connecticut River shad received on Tuesday.

—In the market last week one of the most inspiring sights to an old salmon rod-fisherman, was five noble Scotch salmon, all the way from their native Tweed. They had crossed the Atlantic in prime condition, and now laid side by side on the marble slabs at the stand of Messrs. Middleton and Orman, nearly uniform in size and uniform in their hues of blue and silver, whose lustre the long voyage had scarcely dimmed. The quintette weighed together 125 pounds, the largest scaling full thirty pounds. An old Scotchman, whose birth-place was beneath the shadow of Kelso Abbey, was looking at them lovingly, as if they might be kindred. He recalled to mind the many struggles he had had in bygone days with fish as noble as they, whose capture required all the patience and artifices of the angler's craft, and no one but those who have tried can ever know what skill is required to kill so heavy and monstrous a fish with rod, reel and line. It is impossible to realize what 25 or 30 pounds of live, active salmon represents until one has seen the huge bulk stretched out before his eyes. The achievement of landing so great a fish is something to be justly proud of. These five fish, however, were not taken with the rod, but with gill nets. The discolored marks upon their broad shoulders showed where the fatal meshes had taken hold. From a measurement made, it was evident that the meshes were fully eight inches wide. The written testimony was a credit to the sagacity and providence of the Scottish fishermen and the wisdom of the Scottish laws, and a rebuke to the cupidity of greedy men who spread their toils for everything which swims, big or little, weaving their meshes so small that sprats can scarcely wriggle through.

Round black spots upon the gill covers are infallible identifications of the true salmon, and while these vary in number it is rare to find a fish without them. One of these Tweed salmon was peculiar in this respect, the spots being wholly absent. Of the other four, two had a spot each on one opercle, and two on the other; the third had nine spots on one cover and four on the other; the fourth, eight on one cover and three on the other. We had a present of a chunk of one of these Tweed salmon, and we assure our readers that it was a *bonne bouche* the flavor very little impaired by lapse of time since the fish was taken from its liquid element.

Years ago, and up to 1855, the importation of salmon from Great Britain was of frequent occurrence, and the market price was \$2.25 per pound for a lot of fifty fish and upward. With the restoration of our own salmon fisheries, in both the Atlantic and Pacific waters, the price has dropped to 40 and 60 cents per pound, but the spring run of Eastern salmon readily bring \$1.25 per pound.

MASSACHUSETTS—*Medford, March 23.*—Smelts have returned to their spawning beds at an earlier date and in larger numbers than heretofore. The law provides for their safety (or rather the watchman's pocket) from the 15th of March to the 1st of June, but during the unusually warm weather of the first of the month they made their appearance in large and goodly numbers, which necessitated the employment of a watchman to protect the hasty *eperlannus* from the frying pan of the immediate neighborhood. MEMOR.

MOVEMENTS OF THE FISHING FLEET.—The number of fishing arrivals reported at this port the past week has been 30, viz., 8 from the Banks with 300,000 lbs. halibut, and 22 from Georges with 650,000 lbs. round codfish. Fresh halibut were in liberal receipt the first of the week.—*Cape Ann Advertiser, March 23.*

RHODE ISLAND—*Newport, March 4.*—The first sea-bass of the season was taken last week by Mr. Grandal at Scituate Point. SEA DOCK.

NORTH CAROLINA.—The shad fishery in Albemarle Sound is reported to be a dead failure this season, and those who have large amounts of capital invested feel greatly depressed in consequence.

TENNESSEE—*Nashville, March 23.*—The weather the past week was most favorable to anglers, and they did not fail to take advantage of it. All those who went out met with good sport, and some of them took a great many fish. A party of gentlemen from Fayetteville caught in the Elk River, a tributary of the Tennessee (and one of the best stocked streams in the State) forty pounds of trout (bass) and black perch. Another party of three caught on the 21st inst., in Big Harpeth, thirty odd pounds of trout (bass) and black perch. To-day Messrs. Massey, Baker and Jackson, of this city, caught in Little Harpeth fifteen trout (bass) and one black perch, the former averaging 1½ pounds each. They caught them early in the morning, the fish ceasing to bite after eleven o'clock.

A few years ago a large number of shad eggs were put in the Cumberland, Tennessee and Ohio rivers, but the experiment has not proved successful; none of them have returned to the Cumberland, and but few have been seen in either of the other two rivers. At the time the deposit was made in the Cumberland there was a heavy freshet, and a great deal of drift-wood floating down, and this is no doubt the cause of the failure. The Meek reel is the favorite one among the more scientific anglers about here. They use the natural Japanese bamboo rod, from eight to ten feet long, and weighing from six to twelve ounces; to give them more stiffness they have them wrapped between the joints. The bait used is the minnow for trout (bass) and black perch; sometimes they will strike at a grasshopper. From what I have seen of the tackle used by several of our fishermen, I am satisfied that were they to use more delicate lines and colored to match the water, and some of the artificial flies in use elsewhere, they would be more than rewarded by the increase in their takes of fish. There are a number of artificial fish ponds about here, in which large numbers of bass, brim, and white perch are grown. When very small they are taken from the creeks with seines, and transferred to these ponds, where, with a little attention, they grow very rapidly. There is no establishment in the State for hatching, though there is no place in the country having more natural advantages for doing so than here. J. D. H.

Columbia, March 25.—Trout fishing here is now in full blast. Daylight finds parties on the road to the dam across Duck River, one mile north of the city, with their

tackle, all anxious to get there first. I counted no less than twelve there one morning, comprising sportsmen, profit fishers and ground-bog case anglers; men, boys, whites and blacks, all anxious "to get a bite." Although a great many trout were taken, I led the score with a reel of eight, weighing from one to two pounds each. There are fifty-four trout lines between the city and dam, and how fish manage to escape all the hooks on fifty-four trout lines is a mystery. The largest trout was caught by L. P. P., weighing two and one-half pounds. Catfish, suckers and red horse caught abundantly. VAL.

Will Val please step to the front and explain what a "ground-bog case angler" is?

SPECKLED TROUT IN TEXAS—*The Sportsman's Gazetteer* indicated.—Exception having been taken to a statement of Hallock's "Sportsman's Gazetteer" that there are speckled trout in Texas, we submit the following letter from the author of the "Coraing Empire; Or, a Thousand Miles Through Texas on Horseback":

Mr. Hallock—Dear Sir: I have yours asking if we have the true speckled trout—*Salmo fontinalis*—in Texas. I have never seen it in Texas, but believe that it may exist in the streams of the elevated territory of the northwestern portion of the State. Judge J. F. Crosby, who lived several years at El Paso, tells me that he saw them very abundantly in a tributary of the Pecos, called Rio Bonito; but this is in New Mexico. As it is not far from the Texas line, I do not see why they may not be in the same sort of streams in Texas. The country is the same on both sides of the line, and the streams in all respects similar. Judge Crosby is sure that these were the true speckled trout, and there are few who are better skilled in ichthyology than he. I fully believe that you are right in your "Gazetteer," though most of Texans may not think so. The *Salmo fontinalis* certainly does not exist in the State outside of that wild, elevated territory. N. A. TAYLOR.

OHIO—Painesville, March 24.—C. A. Hardway caught four black bass in the river the other day. They averaged three pounds apiece. TARGET.

IOWA—Pomeroy, March 22.—Fishing is prime now. Pike are being caught by the load at Twin Lakes, near here. Friars catch them and salt them down for summer use, and they are very nice. They are brought up sometimes as large as twenty-five pounds, and one was speared in Coon Creek, at Oxenford's Mills, that kicked the helm at thirty-three pounds. How is he for a minnow? Nothing is taken now but pike, the buffalo is not yet running. A large lot of California salmon were placed in the lakes about three years since, but nothing has been seen of them since, and it is thought they have all fallen a prey to the voracity of the pike.

—H. L. Leonard, of New York and Bangor, Me., has donated as a prize for fly casting one of his very beautiful six-strand split bamboo trout fly rods, 11½ feet long, with a reversible handle, so that the reel can be used above or below the hand; two long tips, one short tip for bait, in a black walnut grooved case, gotten up expressly for the occasion in extra style, to be competed for at the next annual meeting of the New York Sportsmen's Association, to be held in May at Buffalo, under the auspices of the Forester Club. Mr. Leonard's thirty years' experience in fly fishing for trout and salmon in the United States and Canada, have qualified him to know what the requisites of a good rod are. He is the first person, we believe, who ever made a six-splice bamboo trout rod. His six strand salmon and grise fly rods have an equally enviable reputation. The winner of the prize at the Buffalo contest will consider himself a fortunate man.

EMULATION IN ANGLING—*Mr. Editor*: Trout fishing possesses peculiar fascination. Amateurs have been at a loss for adjectives with which to describe the emotions awakened by the first "strike," and the ecstasies experienced by their first capture. Though ordinarily it is all that may be claimed for it by even the enthusiast; yet it is possible to add greater zest to the pleasure by the introduction of a little wholesome competition. My simple object is to tell of one way in which this may be done. It is a plan that was adopted last season by several gentlemen residing in Chatham Village, Columbia County, New York, and which worked very successfully and happily.

In pursuance of a previous invitation, these gentlemen, eight in number, met together and resolved to form themselves into a club to be known as the "Field, Flood and Forest Fraternity." They called themselves, in brief, "The F's." They then proceeded to elect a President, Secretary and three of their number, whom they called "Masters of the Scales," to receive and weigh the products of the stream as they might be offered by the members, from time to time, and to report the result to the Secretary, whose duty it was to make and preserve a careful and accurate record of the same.

A first-class trout rod was procured, for which the members should compete, subject to the following conditions:

The trout must be caught with hook and line, during the season of 1877, between the 10th of April and the 9th of September, in any of the streams alike accessible to all the members, within a radius of 60 miles from Chatham Village. This excluded all lakes and private ponds. The member who first takes a trout weighing eight or more ounces to have charge of the rod. Any member taking a heavier trout than this shall receive the rod into his custody, and so on, the heaviest weight taking the rod. The member who thus holds the rod at the end of the season shall retain the rod as his own personal property.

The members were required to go a fishing on the last day of the season, and on the evening of that day or the day following they were to assemble at such time and place as should be determined upon, to partake of the trout on hand, the successful competitor for the rod furnishing the *et cetera* for the dinner, and the members of the fraternity, relying upon the inspiration of the occasion, to suggest suitable toasts. The members put themselves upon their honor in this declaration:

"We are a fraternity of gentlemen, and each is placed upon his honor in respect to his strict adherence to the foregoing rules and regulations, and any member who may, by falsification, prevarication or deception of any kind, compromise his honor and betray the confidence of his fellow-members, shall apologize for the same and purchase for the next season's competition the prize, to be worth not less than \$10, nor more than \$100."

The nearest approach to a violation of the compact happened in this way: A member of the club received one morning, from a friend, five or six nice trout from the New York market. That same day this gentleman and another member went together to whip "Indian Creek"—a stream about two miles distant. "Indian Creek" was once quite celebrated for its trout; but, like many other streams in neighborhoods which have become populous, it is now only occasionally that you have the good fortune to take a fish. In an incredibly short time they returned from their excursion with three fine specimens. The largest lacked only a fraction of an ounce of weighing enough to take the rod, and sufficient shot was introduced into its stomach to make it outweigh the champion trout. That afternoon the news reached the ears of the custodian that his fourteen-ounce had been beaten by a fraction over. There were symptoms of great uneasiness in that man's bosom. His peace was gone. His rest was broken, until a day or two afterward, when he was officially informed that the whole affair was a hoax.

The trout which took the rod at the close of the season weighed 14½ ounces. The whole number caught by the club was 1,028, weighing about 100 pounds. Ninety-one were taken the last day, affording a bountiful supply for the final dinner of the season, which formed a fitting conclusion to a season made ten-fold more interesting by a little competition. HIX.

[The suggestion of our friend is a happy one.—ED.]

INSTRUCTIONS IN BASS FISHING. No. 1.

CHICAGO, March 12, 1878.

Dear Editor—This warm spring day the spirit of the fisherman is upon me, and, neglecting my labors and forgetful of the cares of life, I have sat by my table for an hour, dreaming over and over again my last season's sport. I want to talk to some one of the delights of bass fishing, and I propose to talk to you awhile about it, and to your readers, if it shall please you to introduce me to them.

Do you know how to take black bass *secundum artem*?

Now, Mr. Editor, this question is not addressed to you, because you are supposed to know everything, especially everything pertaining to the arts of fishing and hunting, and if one may judge from a perusal of your "Answers to Correspondents" upon all conceivable subjects, you either do know everything or you have a most wonderful encyclopedia. No, this question is addressed to an imaginary reader, who is not supposed to know anything, and of course he replies no. Now, I do not profess to know all about it, but something, and that something I propose to impart upon said imaginary reader. And, first, I wish to define what is not bass fishing. It is not bass fishing to sit in the stern of a boat with a big line in your hand and a tablespoon at the end of it, trolling about at your ease to the great disgust of your boatman, and to pull in your fish hand over hand, by main strength, as you would a log of wood. I once saw a gentleman trolling for bass upon a lake in Wisconsin, with three lines astern with spoon-hooks, and a fourth line, attached to a rod, also trolling, while he sat in the stern of the boat with an umbrella attachment over his head to keep off the sun, while his boatman pulled him about the lake a whole blessed day. As I was fishing the same lake I watched him, as I would the actions of some monstrosity. Whenever a fish struck the hook connected with the rod he would give a yank, then throw the rod into the boat, grab the line and come the hand-over-hand operation. I wished then that some big fish would haul him overboard and drown him. Such ought to be the fate of all who try to murder bass in that way. There is another class of men who should never receive "benefit of clergy" from me—to wit, those who destroy bass with set lines. I find that I have not patience nor time to detail all the ways of killing fish without fishing, but every fisherman knows them. It is more pleasant to describe the genuine article.

FIRST—THE PREPARATION.

The rod should be light, about eight ounces; short, two joints, and about 15-inch but, with a pretty stiff tip. I prefer the bamboo, the split of course is the best, but the other will do well enough. The reel should be placed at least ten inches from the end, in order that the hut may be held against the body when necessary, and at the same time the reel easily managed. I notice that Mr. Hallock places the reel at the extreme end of the rod. That is all right for light fish, but not for the strong black bass. [Remark—Except for a two-handed rod, weighing two pounds and upward, we advocate shipping the reel near the end of the hut, and not above the grasp of the hand. It is absolutely necessary that the same hand which holds the rod shall be able to manipulate the line in casting.—ED.] I once bought a rod with the reel rings at the end because it looked so pretty, but at the close of my first day's bass fishing with it I applied my knife to it, and the next day the reel was where it ought to be. To control bass all day with ease, with the reel at the end of the rod, requires a stronger left arm than many fishermen are blessed with. Besides, it is difficult to cast with a rod rigged in that way. Join the rod so that the line guides will be on the lower side, as the line then runs more readily and is not liable to stick or be caught on the rod or rings; by the way, have large ring guides [we prefer standing guides.—ED.] and have the first ring at least eighteen inches from the reel. Have the line pass from the reel to the rings under the rod by the right-hand side.

THE REEL.

The best, by all odds, in my opinion, is the "Meek." I lately read in your paper the article by George A. Shufeldt in which he throws discredit upon the "Meek" and prefers the common double multiplier. I disagree with him in toto, however much respect I have for his abilities as a fisherman. In passing I would say that I have fished many a time and oft with Mr. Shufeldt, and can vouch for his skill, and I venture to believe that the Kentucky gentleman who seems to think that Shufeldt needs some lessons in the art of casting would find upon trial that he could teach him nothing. I admit that it requires more care to cast with the Meek reel than with the others; it pays out the line just twice as fast, and if the bait does not carry it off far enough the line is apt to overrun and foul badly on the reel, and unless checked promptly when the bait strikes the water, it will then overrun also, but by a little care and experience in the use of this reel you will readily overcome this disadvantage unless you are a very impatient

man. On the other hand the powers of this reel are so vastly superior to all others after you have hooked your fish as to greatly counterbalance its disadvantages in making the cast. The great rapidity with which the line can be taken up or let out renders it the prince of reels. Another thing of not so much importance, it saves just half the labor required by other reels, as with one turn it does the work of two.

THE LINE.

This should be of the lightest description. Capt. Fitzgibbon, of Indianapolis (bless his old soul), than whom a more skillful fisherman does not exist in the Northwest, is reputed to have caught innumerable bass with a linen thread, but I never saw him do it. A twisted or esble-laid linen, or a sea grass line is the best—the lightest you can find. Avoid braided silk, as after a while it will flatten and pack on your reel. Don't look at oiled silk, even the best English make, as they will tell you at the shop. If you take sea grass, which I think is the best in the long run, get the kinks out of it by towing it loose for a while behind your boat. Have at least 125 to 150 feet of line.

THE HOOK.

The round "Carlisle" is the prince for bass, No. 4. The sprout-head comes next. Avoid the Limerick and all crooked hooks—use hooks with gimp attachment. Don't lead your line, but attach the hook to it by a swivel. Have about 50 good-sized live minnows in your bucket. Shiners are the most attractive, but chubs will stand the racket better. Take a landing net, a basket of lunch, your pipe, a dry boat, a good boatman who knows the points of the lake, and upon the whole I think you are well fixed for the day. Now for the fishing. It is necessary that you start right. Don't put on any airs with your boatman. You can't keep them up; he will find you out at the first pop. Take him into your confidence at once. Tell him that you don't know anything about bass fishing; have never tried it on, though, in order to preserve his respect, it is best to give him to understand that a good share of your life has been spent in salmon fishing in the wilds of Canada, diversified by an occasional run into the Adirondacks for trout. You may casually speak of the glorious sport experienced in landing a thirty-five pound salmon or four-pound trout, but you must be careful to tell him that in salmon and trout fishing you have always used a heavy rod with a slender tip (don't give yourself away by calling it a "pole"), and have always fished with a fly. Tell him that salmon and trout are very dainty and require different flies for different hours of the day, or different weathers, but that your experience has been that they will rise oftener to a brown hackle than any other. A little of this style of conversation will place you upon a seeming equality with him, which may last an hour or two. Be sure and tell him that you have never tried these light rods or cast from a reel, and you want him to teach you. This will flatter him and he will help you all he can. Pass your flask to him once in a while with the remark that it is pretty hot work for him, and he will think you a "good fellow" and take you to all the good places. If you do not have good success after awhile tell him that you are rather tired of standing and would enjoy the variety of rowing. Change places with him and let him have your rod, and if there are any fish around he will get you enough for a show at home.

Now, Mr. Editor, I find that it has taken me a long time to get my imaginary bass-fisher fairly started upon the lake, and if I undertake to tell him what to do, now he is there, my chapter will be so long that you will never publish it for his benefit. I bade to stop, now that I have got to where I intended to coramence, and if you will give me another bearing, I will be glad to continue my lessons. Yours, G. C.

Answers to Correspondents.

No Notice Taken of Anonymous Communications.

A number of anonymous correspondents will understand why their queries are not answered, when they read the lines at the head of this column.

FLY ROD, New York.—Letter for you at this office.

G. H. M., Troy.—Pedigree all right and reliable in every way.

G. E. S.—Is a \$50 gun considered a good one? Ans. Yes—for the price.

C. F. S., Richmond.—Your method of testing the pull of your trigger is a good one.

F. N. B., Newton Centre, Mass.—You must apply to Col. Schermerhorn for a copy of a report. It is just issued.

JACOBSTAFF.—See "Al. Fresco's" description of weatherly boat suitable for Florida waters in our issue of March 28.

C. H. W., Jr., St. Louis.—All the marks you give are Tower proof marks. Never heard of the maker you ask about.

J. B., Chester.—Why don't you communicate with Baird & Iluston, yacht builders, of Philadelphia. See their advertisement in our paper.

A. H. C., Canandaigua.—You can buy a copy of "Keige Anchor" from J. L. Donner, Columbia, Tolland county, Connecticut. Address P. O. Box 40.

SUBSCRIBER, Hyannis, Mass.—My young setter kills hens. Would be quite valuable if cured of this bad habit. Ans. Thrash him severely when caught at it.

Dr. S., Sandy Falls, Mo.—Does Dr. Carver shooting glass balls with a rifle use a hair trigger, or a three pound pull? Ans. Not a hair trigger, but do not know the pull.

MISAL, New London, Conn.—Can you give address of parties who buy old and valuable works? Ans. Address Mr. Wright, care Leavett Bros., Clinton Place, New York city.

J. R. A., Petersburg, Ill.—Please give me, through Correspondents' column, the address of some dealer in aquarium goods at Chicago. Ans. Fred Kaempfer, 127 Clark street.

S. J. M., Baltimore.—Please give me prescription for a tonic pill for general use? Ans. Nothing better than a pill made of two grains of quinine taken three times a day, if a tonic is wanted.

Sus, Tenady, N. J.—We have not on hand Moffat's "Secrets of Angling," but can import from England in six weeks' time. Price \$3.75. Please advise us if you wish us to obtain it.

PLANKERS, Hudson, N. Y.—The address you wish is W. H. Daly, M. D., Pittsburg, Pa.—Send your letter to this office at once, as the Doctor is bound for Europe and will call upon us on his way.

ICE KING, Catskill, N. Y.—1. How much capital is invested in the ice business? 2. Does this country ship ice abroad? Ans. 1. Between thirty and forty millions of dollars. 2. Yes, to South America.

H. J. H., Boston.—You can use with safety the load you mention—4 lbs. powder and 1½ oz. shot—in your Smith & Wesson 12 bore, 7½ lbs., breech-loader, but it might be very uncomfortable as to recoil.

J. W. M., Winterset.—You ought to get Hazard, Dupont, Ladin & Rand, with you; cost should be, say, \$1. If poor powder is found where you live get your storekeeper to send to Chicago for good powder.

R. T. VAN BUREN.—We trust soon to get up some wood-cuts which will fully illustrate what you wish to be acquainted with. Many of our readers have asked for it. Such cuts have been published in England.

CURTIS.—What wood is best for dry rod for trout, except bamboo, and price? Ans. Ash hnt, second joint and tip of lancewood; but and second joint greenheart, tip lancewood; entire greenheart. Price \$10 manufactured.

O. W. M., Irving Place, City.—Gordons, black and tan, occasionally with white; Irish, red; Layeracks, white with blue ticks; for field trial colors they go through all shades. Could not send you the game laws you require over a volume.

H. M. S., Pittsburg.—A 14 gauge as far as killing upland game will answer your purpose. All things being equal, of course the pattern of a 14 is not equal to a 12, but penetration soil range and everything else are quite as good in proportion.

F. S. S., Brooklyn.—My setter dog, three months old, is bow-legged, and his ankles are very large, as if double-jointed. I have had him three weeks, and don't allow him to run about. Can you inform me what to do? Ans. Let him run at large.

G. E. S., Bracketville, Texas.—Have got a pointer bitch six months old. She has white lumps similar to warts on end under the tongue and lips. What shall I do for it? Ans. Destroy the lumps if necessary by careful application of solid nitrate of silver.

W. C. P., City.—Vermont statute forbade fishing in tributaries of the Deerfield River. Has this expired, and can we fish those waters this spring? Ans. The law was passed in Nov., 1876, and there will, therefore, be no fishing until the spring of 1879.

B. P., Pittston, Pa.—Inclosed find patent fish hook. What do you think of it? Ans. We have noticed this new style of hook editorially in a previous issue. We have no objection to the hook, if the fish like it; but we prefer the old fashioned varieties.

SETTER, Pavilion Centre, N. Y.—Have a setter dog that howls and barks if I take him away from home and chain him in a barn as soon as I am out of his sight. How shall I break him? Ans. Occasional punishment for the fault, and time will probably cure him.

DEOHAM, Mass.—I have a setter costing \$100 having a disgusting habit. What shall I do to cure him? Ans. We know of no absolute cure. Give him plenty of exercise and chain him as little as possible. Punish him when caught at it and let him line a few bitches.

PAT GALBRAITH, Erie.—Such a pistol as you ask for is no longer made. You might get a duelling pistol, and put a peep sight on it. We cannot agree with you in regard to the advantages of a muzzle-loader over a breech-loader, nor are cartridges filled with packed powder.

S. W. B., Vicksburg, Miss.—The "Marooovers" are going to make an effort to have the Sandflower and Yazoo Rivers stocked with salmon or shad. Can you give us any information as to the proper way to begin operations? Ans. We have written to you by mail, giving directions.

J. R., Sharon, Pa.—A and B tie on a handle and trap pigeon match. B has birds to shoot off the A. A has none; B therefore claims that he has won. Ans. If no provision was made for a tie we should decide a draw. The tie should be shot off where the birds could be procured by both parties.

G. N. R., Georgetown, S. C.—Your targets 1 and 2 are fair, but 2 and 3 are quite excellent, and you deserve credit for your ingenuity in chocking your barrels. We must say that if only other quettovers would imitate your method of making drawings of targets our work would be much facilitated.

G. R., New Bedford, Mass.—I desire a light, cheap and serviceable canoe. I cannot afford much more than \$10. Can I obtain a hick-hack canoe for this sum? Ans. Address David Dresser, Calais, Maine. He may be able to get you a good second-hand craft for \$10. A new canoe costs from \$15 to \$20, usually.

C. R. H., Newcastle, N. Y.—1. What will it cost to send a dog from Newcastle, Westchester Co., to Baltimore? 2. Pray send me form of entry of the Baltimore Bench Show. Ans. 1. Express Co. \$2.50, not boxed, from New York to Baltimore. Some slight addition from Newcastle. 2. Have forwarded you one.

C. E. C., Oil City, Pa.—What Government publications, or railroad reports should I procure fully describing the habits, etc., of the game birds, fishes and animals of Montana? Ans. Write to Prof. F. V. Hayden, U. S. Geological Survey, Seventh street, Washington, D. C. See also "Hallcock's Sportsman's Gazetteer."

C. E. M., South Boston.—My setter bitch is two years old. For the last eight months has been in good condition. Coat is now, however, rough, and eyes inflamed, with slight discharge; keeps thin; appetite not good. I feed on meat and scraps. What shall I do? Ans. Stop feeding meat, and give plenty of exercise.

E. C., S. 3d St., Philadelphia.—Have a Skye terrier; think he has distemper. Symptoms as follows: Cannot keep quiet; has had three fits; hides away; is very thin; does not eat; has a difficulty in swallowing. He is four or five months old. Ans. The dog has fits, and not distemper. Most probably will outgrow them. Feed on meat.

A. C. T., Ashtabula.—1. Would you advise me to buy a \$45—gun for general shooting? 2. What is the difference between a \$45 and a \$100 laminated gun? 3. Would you think a—gun preferable at the same price? Ans. 1. It is a gun we think very highly of. 2. The more expensive gun is the better. 3. Respectfully decline answering.

PARTIDGE, Mass.—1. Have a double-barreled breech-loader, laminated steel, choke-bore No. 12, weight 7½ lbs., marked on lock ———; do you consider him a good maker? 2. How much Dupont powder shall I use? 3. Is the name on the lock of the gun a guarantee? Ans. 1. A good maker. 2. 3½ drs. powder, 1½ oz. shot. 3. Not always.

SUNSHOWER, Stamford.—1. What is the price of Spratt's dog biscuits? 2. Is Indian meal good food for dogs? 3. What is a good, cheap food for dogs? 4. When should English snipe be here? Have only seen one so far. Ans. 1. Ten cents per pound. 2. Excellent. 3. Indian meal and oatmeal. 4. Just about this time they about appear in good quantity.

E. F. B., Gouverneur, N. Y.—What is the best preparation to put on canvas boats for sizing or making a surface instead of (or before) painting, which will prevent the canvas from absorbing paint? Ans. Would advise a coat of boiled linseed oil, and then when you paint thin your paint. A thin preparation of a shellac varnish may be used, only it is an expensive compound.

D. O'C., Girardville, Pa.—Can one get the seeds of watercresses

planted in a little spring, or shall they be transplanted? How should they be transplanted? Ans. Seeds of watercresses can be had in any of the New York, Philadelphia, Baltimore, etc., seed stores. Sow in shallow water or close by the edge of a pond; they will soon spread and take care of themselves.

L. B., Long Branch.—Questions of choking valuable guns such as a Dougat we always approach with a certain amount of hesitancy. Haydeo, in Fulton street, could possibly choke your barrels for you. Some instances where we have advised our friends to try choking have turned out well. Suppose you write to W. R. Shafer, of Boston, or to Clark & Snyder, of Baltimore, about it.

J. W., Pittsburg.—Have a lemon and white setter pup, strong, slender, full breast, pretty well feathered, full forehead, but not a very square nose; tapers somewhat to the point, which is flesh color, and has black eyes. Are these good points going to prove him a full blooded English setter, which I bought him for? Ans. Should think from your description that you have a good dog.

W. J. R., Syracuse.—1. Where is the Evans repeating rifle manufactured and by who? 2. Also the Express rifle. 3. Do Smith & Wesson make a 32 cal. revolver same style as their 35 with automatic ejector? 4. Can the same cartridge be used in their 41 cal. that is used in the Winchester rifle? Ans. 1. Evans repeating rifle at Mechanicsville, Maine. The Express in England. 2. Yes. 3. No.

SUNSHOWER, Philadelphia.—1. Want a cure for my setter gyp. Six weeks ago she had pups, and by bad management she lost them. Since then a lump has come out on one of her dogs, about as large as a horse ball. What ought to be done? Ans. She should have had the milk properly dried up in the glands—difficult to cure now. Give the gland support, if possible, and rub with camphor ointment.

R. L. G.—1. Where can I procure a county map of California? 2. Is Sharps' new model military a good rifle for large and dangerous game? 3. Is the climate at the foot of the Sierras in California good for consumptives? 4. Is \$1,500 sufficient to start a farm with there? Ans. 1. Send to the Coltons, William St., N. Y. 2. Yes, excellent. 3. We have heard it highly spoken of. 4. You can start with that.

J. P. S., Philadelphia.—What is the average height, weight, and length of ear of a prize-winning beagle at bench shows? Ought stern to be flagged? Ans. The smaller the beagle the higher the price. A prize winner ought to be from 9 to 11 inches high (smaller the better). Weight from 12 to 18 pounds; length of ear, from 6½ to 7 inches. The ears ought to meet under the chin easily. Slight brush at the tail.

SPORTSMAN, Ithaca, N. Y.—Have a setter pup six months old. Has dysentery. Got better of it in a measure, but is affected with a difficulty in breathing. Eats well, is lively, coat bright and glossy, eyes discharge slightly violent. Exercise produces heavy, short breathing and cough. What is the matter and what must I do? Ans. Chronic bronchitis; result of distemper. Give him plenty of gentle exercise and keep warm and dry.

H. C. M., Worcester, Mass.—Would you be kind enough to give me a word of advice in regard to the take region of Florida? Would it be a good place for a poor man to go that is willing to work some, hunt and fish a good deal, live in a log cabin and eat what he can get? Am a good shot. Ans. The region you speak of is one of the choicest in the southern part of the State. Have written you by mail, giving snappy suggestions.

J. M. D., Irwin Station, Pa.—Can a gyp fourteen months old be spayed successfully? Can a gyp be spayed after having had puppies? Are they as good for hunting after spaying as before? Ans. They may be spayed successfully, but danger is greatly increased after once being in heat. Mooted question as to excellence to the field. We think that though the sense of smell is not impaired they certainly have not the same courage as a perfect animal.

F. P. H., Syracuse.—1. Of the — and — breech-loading rifles, which, in your judgment, is better for common sporting purposes, such as shooting deer? 2. What can I purchase a breech-loading Ballard rifle for, one using .38, weight 8 lbs., and 28 ins. length of barrel? 3. What would a Remington cost, same description as the above? Ans. 1. Both rifles excellent. 2. Write to Schoverling & Daly, New York; price \$35 and upward. 3. About the same price.

TOP SNAP, Cazenovia.—Please give address of Heggamao, maker of portable boats? Also, how large does the tree known as white holly grow, i. e., diameter? Address of any man making portable boats. Ans. John Heggamao, Briston Spa, New York. Other portable boat builders are C. A. Finner, Myrtle, Ct.; R. C. Scott, Albany, maker of the Colvin boat; J. H. Bond, Cleveland, Ohio, and Osgood & Chaplin, Battle Creek, Michigan. Holly grows ten inches in diameter.

W. P., New Britain Conn.—In last issue F. and S., in programme for German Shooting Festival, regulation 3 is as follows: "Any fire-arm is allowed which carries not less than thirty round balls to the pound." Would this exclude the use of a Remington Creedmoor rifle with long-range bullet on any target mentioned in said programme? Ans. The Secretary of the German Shooting Festival writes us in reply to this: "Long-range rifle balls are not allowed in Schutzenhaus rules."

A. W. G., Boston.—Please tell me the very cheapest way of going to San Antonio, Texas, from Boston by car? And is there any other mode of traveling by which I can get there cheaper, and if there is will you explain how? Ans. Via Miami, Kansas and Texas railroad from Hannibal, Missouri, to Hempstead; thence to Austin and thence stage to San Antonio. A cheaper way would be to take steamer from New York to Galveston and cars to Hempstead and Austin as above.

R. T., Cincinnati.—1. What kinds of .22 cal. rifles are used at — gallery? 2. Which is the longest range of a .22 cal. rifle in gallery practice? 3. Is the — .22 cal. a good rifle? 4. How do you receive money from subscribers? Ans. 1. In the gallery you mention, Ballards, Wessons and Remingtons are used. 2. As to gallery practice, at 200 feet is about an extreme range for practice. In Boston, at the Lincoln Gallery, the distance is about 160 feet. 3. An excellent rifle. 4. By P. O. order.

A. O., Schanks, Ohio.—1. What brand, and what No. of powder would you use for all purposes in a 30-lach, 11 gauge, muzzle-loader? 2. In what localities in West Virginia are deer, bear and mountain trout abundant? 3. In November a favorable time for hunting such game there, and are trout caught there in that month? 4. Is the — model of 1873, a reliable gun for such game? Ans. 1. Hazard's FG. 2. Michigan. 3. Deer, yes, but not trout. 4. Best rifle you could take with you.

G. D., New York.—The specimen of your work in fly tying is excellent, and your Blue Dunn particularly so. If we may be hypercritical, your bodies are a little too heavy. When your fly falls on the water it ought to make scarcely a ripple. Now, weight for a bass fly makes not much difference, but for a trout, a shy—wary fish, indifferent somewhat to color—he wants a more delicate lure. A trifle less material and tighter work would insure durability and especially lightness in casting.

F. E., New Orleans.—Have a pointer three to four years old. No worms, coat good, lips rather pale. Secretions from kidney dark, appetite variable. No fever, but with a bad cough apparently deep seated. Ends her coughing with panting. Coughing comes on after drinking. Ends her coughing with panting. The dog has bronchitis probably or when suddenly exercised. Ans. The dog has bronchitis probably or when suddenly exercised and occasionally give a dose of cast-

tor oil. Also, ten grains of murate of ammonia in solution three times a day.

Rowe's Hotel, Burlington, Va.—Nine months ago my pointer dog had what I suppose was mange. I used, externally, tar and sulphur. Hair grew out, but disease went to head and ears. Two cracks appear on ears. Goes around the room with his head on one side and shakes his ears. Disagreeable smell from him. What shall I do? Ans. Your description very clear. Your dog has canker of the ear. Wash with warm water and then pour in a little dilute lead water (which you can get at any druggist) once a day.

J. G. A.—1. Please inform me how the cal. of a rifle is measured, from the lands, or grooves? 2. What is the peculiarity of the Express rifling? 3. Do the Creedmoor rifles have a "nip" at the muzzle? 4. Why don't they allow telescope sights in the N. R. A.? Ans. 1. From the lands. 2. Peculiarity not much, if any, on rifling, but the Express system depends on heavy charge and tight projectile. 3. Yes, and so have all target rifles. 4. Because the end and aim of Creedmoor is to bring into perfect practice men with ordinary and not extraordinary weapons.

F. H., Chicago & N. W. R. R.—Have a Scott gun, breech-loader, 10 gauge, 10 pound, cylinder bore, heavy at the breech, which I would like to have choked. Would it make it shoot closer and not stronger, and not weaken the gun? Can you mention some firm who could do it, and what would be the expense? Ans. The gun can be made to shoot closer. Could not tell you the expense. Write to Clark & Snyder, of Baltimore, or to Shafer, of Boston. In all such alterations, however, care must be taken. It often happens that the improvement is not great enough to guarantee the cost.

HURLINHAM.—In your opinion did Bogardus do his level best at those pigeons on March 22 at Deerfoot Park? Could Cale Loring, were he alive, accomplish the feat Bogardus undertook? Could Cale Loring take his double gun in his hand and lay his old single on the ground and kill two of those birds with the double and then take up the old single from the ground and kill the third bird in case there were three traps six feet apart, with a bird in each trap, he to stand 51 yards from the traps? Ans. We presume the Captain did the best he could on that particular occasion. 2d. Not invention at all.

ROYAL THE SECOND.—1. What are stubb and twist barrels made of? 2. Are there any made now? 3. What is the use of a run on an army musket cap? 4. Which is the best size of shot for duck shooting? 5. I was born on the 19th of March, 1834, on what day of the week was that? Ans. 1. Old fashioned stubb was made of old horseshoe nails, and so was twist. To-day we have no necessity for such material. We can select our iron. 2. Old-fashioned stubb barrels, such as is meant by the above, are not made now—at least out of old iron. 3. In order to lift it off of the nipple. 4. No. 4. 5. Tuesday.

HUNTER, Virginia.—1. How do — stand as gunmakers? What do you think of the \$75 gun sold by them? 2. Will a 12 gauge shoot as far and strong as a 10 gauge? 3. How do you like the action of the — gun, is it as strong as the top or side action? 4. Is 103 pellets to 36 inch circle, 70 yards, No. 8 shot, 1½ oz., good? 5. Can I get any buck number of FOREST AND STREAM and what price each copy? Ans. 1. Excellent gunmakers and at the figure you mention turn out a very good gun. 2. With a heavier charge in a 10 gauge it will shoot further. 3. Very excellent action. 4. Quite a good target. 5. By stating the numbers and remitting to the office.

G. F. G., Amesbury.—1. Have you ever heard of —, a gunsmith or rifle maker? 2. What grain powder—fine, quick powder, or coarse, slow-burning powder—will send the charge of shot to a target quickest at 30 or 40 yds., and which will give better penetration? 3. The pad I send, how is it as to pattern? Ans. 1. Never heard of him. 2. No. 6, Curtis & Harvey, will give greatest penetration, and is the quickest; but for general shooting, where the elements of quickness are not so necessary, our own powders are just as good. 3. The penetration in the book is excellent, and you must have an admirable gun, but it is always exceedingly difficult for us to judge of penetration when we have not a standard ball.

A. B., Haddonfield.—1. Can you tell me about rubber inflated darts? 2. Can a gun No. 12 breech-loader be reloaded full choke without any permanent injury to the gun? 3. Will chilled steel lead a gun like other grades of softer shot? 4. Will they injure the barrels on account of it being harder than other shot? 5. Is not cold oil better to clean a gun than water? Ans. 1. Rubber decoys we have seen, but we do not like them. Are now rarely used. They lose shape and take water. Best, we think, are Simmons' decoys, made of struck copper; they are packed up in boxes. 2. Must give us fuller details. If a heavy gun at breech, with good stout barrels, such alterations can be made. Read our reply to L. B. 3. Sometimes in chokes more, but in cylinders not any more. 4. Do no injury in any way. 5. Would rather use oil.

W. B. F., Rochester.—1. Will floor of emery injure the finish on the interior of the barrels of a fine breech-loader? 2. My gun, 12 bore, gives a pattern of 240 pellets in a 30-inch circle at 30 yards; charge, 3½ drs. powder and 1½ oz. No. 7 chilled shot (84 to the oz.); is the above a good pattern? 3. With the same charge of No. 6 chilled shot (200 to the oz.) the pattern is 140. 4. Which is the best size for duck shooting at long range? 5. What is the relative penetration of Nos. 6 and 7 chilled shot? Ans. 1. Floor of emery should be used only by an expert; a person not understanding how to use it would ruin a gun. 2. An excellent target. 3. As is the one with No. 6. 1. Nos. 2 to 4 accord ing to the ducks; 4 or 5 would suit your section of country. 5. Not yet determined. Write us again about this last question, say in two weeks.

G. H. E., New York.—1. Do you think Texas a suitable place for stock-raising? 2. What will land cost per acre for stock-raising? 3. Would 200 acres be enough land for a start in sheep raising? 4. What will sheep cost per head? 5. What will cattle cost per head? 6. What will horses, or the Mexican ponies that they use there, cost per head? And could you refer me to any parties that I could get information from in Texas? Ans. Texas is the finest stock-grazing country in the world. Land costs from 40 cents to \$1.50 per acre. You could start with 200 acres and a small flock of Mexican sheep, crosses with pure merinos. Coat \$4 per head, cattle, \$17; horses, from \$15 to \$40. Refer to N. A. Taylor, author of "2,000 miles in Texas on Horseback," a book which will give you all needed information. Price \$1.50; for sale at this office. See also files of FOREST AND STREAM for the past two months.

R. S. R., Phila.—In the receipt given in the last number for making a tent fireproof are "paris" by weight, or measure to be used in mixing the ingredients? Will this preparation render the tent more or less waterproof? Could it be used in connection with the sugar of lead waterproofing process? and in that case should all the ingredients be mixed together, or should the tent be treated by each process separately, and by which first? Can you give me a reliable receipt for making, and by which first? Tell me if biscuits, etc., can be baked in first-class cap-jacks in camp? Tell me if biscuits, etc., can be baked in camp by any such means as burying a covered pan in hot coals? Ans. By measure. We cannot answer these questions. We will state here that we have seen the following recipe in the Scientific American for making the lightest materials incombustible. Wash in a concentrated neutral solution of tungstate of soda diluted with about one-third of water, and then mixed with 3 per cent. of phosphate of soda. See innumerable cook books. They can; when the centre of your fire has become hot coals, rake out a sufficient space and place your sponge in it, then cover with ashes and hot coals, and leave twenty minutes. Your crust will be black, but the interior delicious.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INDOCTRINATION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

No. 111 (old No. 103) FULTON STREET, NEW YORK.

[POST OFFICE BOX 2832.]

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Twenty-five per cent. off for Clubs of Three or more.

Advertising Rates.

Inside pages, nonpareil type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial columns, 50 cents per line.

Advertisements should be sent in by Saturday of each week, if possible.

All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

* Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, APRIL 4, 1878.

To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith and be addressed to the FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. No anonymous communications will be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of the mail service if money remitted to us is lost. NO PERSON WHATSOEVER is authorized to collect money for us unless he can show authentic credentials from one of the undersigned. We have no Philadelphia agent.

Trade supplied by American News Company.

CHARLES HALLOCK, Editor.

T. C. BANKS,
Business Manager.S. H. TURRILL, Chicago,
Western Manager.

A WORD TO SOME OF OUR EXCHANGES.—The success of a journal may be partially inferred from the frequency with which its articles are copied into other papers. It affords us, therefore, much gratification to see ourselves so widely and so often quoted, and properly credited. But while the leading journals of the country are always particular to give us due acknowledgments, there are a number of papers which habitually draw upon us for good things, and never dream of making the slightest recognition of their indebtedness to these columns. We make no complaint, gentlemen, but even the Devil deserves his due.

KNIGHTS ERRANT.—The Charleston, S. C., Light Dragoons, celebrated their annual parade and tilt, at the race course, that city, last Monday. The tilts are deservedly popular among our Southern friends, and always attract a large number of interested fair ones, whose presence inspires in their champion knights doughty deeds worthy of the glorious days of the Round Table.

—The *Scientific American* of the 6th inst. contains the best view we have yet seen of the Brooklyn Bridge as it will appear when completed. Could some of those journalists whose names are revered in Printing House Square, return for a moment to the flesh, they would be amazed at the new aspect of their old haunts, with the rapid transit railroads and broad roadway leading directly to the heights of Brooklyn.

BLOOMING GROVE PARK ASSOCIATION.—At a recent meeting of the Blooming Grove Park Association in Pike county, Pa., the following were chosen directors for the ensuing year: Genio C. Scott, Sandra D. Bruce, George S. Greene, Jr., E. Bradley, George H. Glenney, Dudley Field, John Avery, F. S. Giles, A. H. Wellington, Charles Hallock, C. A. Read. The principal officers are: President, Dudley Field; Vice-President, John Avery; Treasurer, C. H. Read; Secretary, John Avery. Excursion tickets for Blooming Grove Park (price five dollars) will be sold this season by the Erie Railway to members of the association.

FOOD FISHES OF THE GREAT LAKES.

Quite a large number of petitions have been presented in Congress recently from citizens of Michigan in regard to the protection of food fishes of the great lakes and the rivers and straits connecting the same. The petitioners speak of the absence of suitable laws and regulations for the protection of the best varieties of food-fish, which are rapidly disappearing, and what should be productive of large benefit and consequent wealth to the country at large, will, in a very few years, if the present methods and system of conducting the fishing interests are continued, result in entirely depopulating the waters of the great lakes of their present store. It is generally conceded that, notwithstanding the efforts being made by the several States to increase the quantity of the better varieties of fish by artificial propagation, the quantity of this kind of fish is steadily decreasing, and while the several States are doing some good in the right direction, your petitioners are fully satisfied that the State governments cannot provide the necessary regulations for the protection of the fish in the methods employed to take them; and your petitioners believe that the power rests in the General Government to pass such laws and regulations that will be effectual in giving ample protection to the fishing interests of the great lakes, that their product will soon increase sufficiently to repay any outlay that may be made, and become a source of large revenue to the country.

In conclusion, they request Congress to pass a law for the preservation of the better varieties of the food-fishes native to Lakes Ontario, Erie, St. Clair, Huron, Michigan and Superior, and the Rivers St. Lawrence, Niagara, Detroit, St. Clair, Sault Ste. Marie and the Strait of Mackinac, and the appropriation of an amount of money sufficient to maintain Fish Commissioners, whose duty it shall be to enforce any law the Congress of the United States may enact. These petitions have all been referred to the Committee on Commerce, of which Senator Conkling is chairman, and he is thoroughly alive to the importance of this great question, not only as a matter of national advantage, but as a special advantage to the people of his own great State, living contiguous to some of the waters named above. Mr. Ferry, the oldest in service, but youngest in years of the Michigan Senators, is also deeply interested in this subject, and, as he is one of the most industrious members of the Senate, there is a good prospect that these two Senators will perfect a measure which will secure the end sought to be accomplished.

WHERE WE GO TO.—The pressure upon the advertising department of the *Herald* is an encouraging indication of increased activity in business circles. In this forecast of better times the FOREST AND STREAM AND ROD AND GUN has a showing, as will be seen by our multiplying advertisements. There is no journal in the country whose advertising pages afford just such a study as our own, and none whose pages are scanned with the same peculiar scrutiny and interest. Many of our readers tell us they look to these pages first, and to the reading matter afterward.

It may be taken as an aphorism that those things which are most directly under one's observation often escape notice. In like manner the circulation of FOREST AND STREAM has grown to an extent which surprised us when we recently examined our mailing books. Its widespread distribution throughout America, as well as in Europe, seemed to us so unusual for a weekly paper that we determined to prepare and print a complete list of the post offices to which our paper is sent by mail. This we have done in pamphlet form. The figures are attested and sworn to before a notary. We have not done this as a challenge to papers of our ilk or other, but because we feel confident of our position. We are willing to stand by our exhibit. We believe that no other paper in the country, of equal circulation, offers anything like the same advantages as an advertising medium:

California, 32; Oregon, 9; Dakota, 12; Colorado, 17; Montana, 8; Wyoming, 9; Idaho, 7; Utah, 2; Arizona, 7; Nevada, 9; New Mexico, 3; Indian Territory, 3; Washington Territory, 13; Nebraska, 12; Minnesota, 41; Iowa, 53; Wisconsin, 56; Michigan, 67; Illinois, 93; Indiana, 38; Ohio, 77; Missouri, 24; Kansas, 24; Arkansas, 12; Texas, 33; Pennsylvania, 61; Florida, 31; Louisiana, 11; Kentucky, 21; Tennessee, 20; Mississippi, 14; Georgia, 19; North Carolina, 21; South Carolina, 12; Virginia, 41; Alabama, 9; Maryland, 32; District of Columbia, 2; New Jersey, 69; West Virginia, 11; Massachusetts, 138; New York, 290; Maine, 55; Vermont, 33; New Hampshire, 41; Rhode Island, 11; Connecticut, 81; Canada, 85; England and Ireland, 26; Germany, 4; other foreign countries, 17.

It must be borne in mind that the foregoing list does not include those places to which bundles are sent by the American News Company upon the orders of newsdealers. So also, it should be understood that to some of these post offices we send hundreds of papers.

A REMARKABLE SURGICAL OPERATION.—The Cleveland, Ohio, *Plaindealer* furnishes the following account of a surgical operation recently performed by Dr. E. C. Sterling, of that city, which is sufficiently remarkable in itself, but will possess an additional interest to our readers, because they are so often entertained by the Doctor's contributions to FOREST AND STREAM:

Robert F. Hurlburt, private secretary of Gov. Bishop, recently underwent the amputation of his tongue near the root. The operation was necessitated by cancer. The surgeons of Columbus would not undertake the operation. Dr. E. Sterling, of Cleveland, successfully accomplished the wonderful task. No one was allowed in the room during the undertaking except the assisting surgeons from Columbus and Delaware.

The chin was sawed in twain and the jaws spread apart in order to take out the diseased tongue. The work was performed in a comparatively short space of time, and the patient was comfortable and conscious in less than an hour. The physicians think he will be able to articulate audibly in the course of time. Thus far the difficulty has been to give nourishment, which has been done by injection. Glass tubes have been secured, and hereafter nourishment will be given by that means until the soreness in the mouth is somewhat subdued.

GAME PROTECTION.

MEETINGS OF STATE ASSOCIATIONS FOR 1878.

New Hampshire State Sportsmen's League, Manchester, April.
New York State Association for the Protection of Fish and Game, Buffalo, May—; Secty., John B. Sage, Buffalo.
Connecticut State Sportsmen's Association, Hartford, May 15.
Iowa State Sportsmen's Association, Des Moines, May 28.
Nebraska State Sportsmen's Association, Fremont, May 21st and 22d.
National Sportsmen's Association, Wilkesbarre, Pa., June 11.
Illinois State Sportsmen's Association, Quincy, June 11.
The Pennsylvania State Association for the Protection of Game and Fish, Wilkesbarre, June 11; Secty., Benj. F. Dowance.
Ohio State Sportsmen's Association, Cincinnati, June 15; Secty., Wiltbank, Toledo.
Tennessee State Sportsmen's Association, Nashville, Dec. 2; Secty., Clark Pritchett, Nashville, Tenn.
Wisconsin State Sportsmen's Association.
Massachusetts State Sportsmen's Association, at call of President.
Missouri State Sportsmen's Association.

GAME CONSTABLES AND THE GAME LAWS.—The office of game constable, under some circumstances, is not the most pleasant in the world. The same reverence attaching to other legislation is not always entertained by a large part of the community for the game enactments. When the laws conflict with personal aggrandizement, advantage is taken of any laxity of public sentiment, and the law is openly and defiantly violated. Without a powerful game elch to support him on the right hand, and a healthy public feeling on the left hand, as Aaron and Hur upon the mountain top supported the hands of Moses, while Joshua smote Amalek on the plain below, the game constable is apt to be worsted in the unequal fight; or, indeed, will refuse to fight at all. This, so far as we are informed, is the situation at Niagara Falls, N. Y. The laws there prohibit the trapping or netting of fish in any manner, except angling with a hook and line, at any time. An extensive fishing business is carried on. The fish are caught by the ton, peddled through the streets, and sold to prominent members of the Niagara Falls Shooting Club. Meanwhile, the game constable, with a child-like and bland simplicity as refreshing as it is ingenuous, pleads total ignorance of any game laws; eats his fish and asks no questions for conscience sake. We confess that we can see no remedy for this unfortunate condition so long as the people of Erie and Niagara counties, or other counties, are content to eat the goose that lays the golden eggs. We presume they must be left in apathetic enjoyment of their inconsiderate repeat.

NO MORE TROUT FISHING IN THE UPPER BEAVERKILL. Dear Rod and Stream: (That's the best part of your name at this season of the year). No more trout fishing in the upper Beaverkill. Please give notice through your columns. Last summer, while I was at Weaver's (formerly, Minson's) there came down from "Quaker Clearing" three men on a buckboard, and they boasted "over four hundred trout;" I could not see nor imagine where they had so many stowed away, but after a while they opened a twelve-quart butter-birkin and showed me the poor little things. They claimed four hundred, and I guess they told the truth. I think that not one of the "fish" was six inches long. Now this sort of thing must be stopped, and I have made up my mind to stop it on that stream. How many of us have fished the Beaverkill! We used to put up at Murdock's, or Flint's, or Walmsleys, or Leal's, or camp out, and catch our creels full; but now-a-days the smallest creel half full of seven inch trout is good luck.

After the sight of those poor little innocents my plans were soon laid. I obtained the next day, from Joseph Banks, a long lease of the stream across his two lots; I have since made an arrangement with Mead Brothers, at the old Quaker Clearing. Messrs. Van Cleef and Van Brunt, the owners of Balsam Lake, have joined me, and so has Ransom Weaver. I have hired a patrol to guard that stream from Balsam Lake down to Weaver's west line, and have posted notices, and the fishing of the upper Beaverkill in Sullivan and Ulster counties, New York, is going to be preserved. All gentlemen sportsmen will keep away from there after this notice, unless they have my permission to fish, and all others will wish they had stayed away if they disregarded it. It is unpleasant for me to write in this positive manner—it sounds boastful and ungenerous—but somebody had to take hold or the fishing would be gone from there in another two years; and, as I have fished there almost every season since 1856, it falls to my lot not unfairly. Since recording my lease, eight of my friends have agreed to share with me the expense of preserving and the pleasure of catching. We shall not increase our number above twelve or fifteen, and in two or three years we hope to have the lake and stream full of trout as they were less than twenty years ago. No tannery nor saw mill has ever polluted the waters of this part of the Beaverkill.

This notice will undoubtedly cause great disappointment to many, especially to sportsmen of Ulster, Delaware and Sullivan counties, N. Y., but I do hope that it will be regarded, because we have the legal right and title and the means to enforce it, and we shall certainly do so. It is but fair to add that any one stopping at Weaver's or at Mead's, will be allowed to fish over their respective pieces of stream, but not on Balsam Lake nor the "Banks" lots. The increasing fondness for real sports and more hunters and fishermen afield every year, and forests and streams near the great cities are almost stripped of fin and feather. Those who cannot take time to go far have but one resource—to preserve the game by restricting the privilege.

Yours respectfully,
GEO. W. VAN SICKLEN.
No. 99 Nassau street, New York, March 23, 1878.

But many rifles would pass this examination which are yet unfit for the sportsman's use, because they require so much elevation that the risk of missing by over or under-shooting is very great. In other words, the trajectory is not sufficiently flat; or, to put it in yet another form, the initial velocity is not enough to admit of aiming directly at the object, unless with a sight so much elevated as to allow for the dropping of the bullet in its passage. Often as the fact has been repeated, there are still multitudes of men who fail to realize the truth, that a rifle bullet falls just as far in every second of its flight, as it would do if dropped from the

hand, without any impulse in any other direction. All that can be done to overcome this effect of gravitation, is to impart such velocity to its forward motion as may carry it as far as possible during a given period, and thus increase the proportionate difference between the horizontal and the vertical movements. Now, we can give to a bullet an initial velocity of 1,700 feet in a second, and by so doing the fall during the fraction of a second occupied in passing over the first hundred yards (300 feet) will be so slight that for all practical purposes the trajectory may be treated as a straight line. There are various methods of ascertaining the trajectory, some of which are elaborate, and require more pains than most men can conveniently bestow. Others are more simple and sufficiently accurate for all practical purposes. Any man can test his own rifle without difficulty by providing himself with a number of paper targets made with a horizontal and a vertical line crossing each other in the centre, and shooting at them from different points on level ground, aiming always at the intersection of the lines, and using the same sights at all the different distances. The best way to do it is to learn first the exact distance for which the fixed sights on the barrel are set, that is to say—the distance at which the bullet will strike the horizontal line when aimed exactly at it through those sights. If the gun is provided with an elevating peep-sight on the stock, it will be well to set it in the first place, so that when sighting through it the bead of the muzzle sight can just be seen through the notch of the rear sight on the barrel. This will prevent the danger of variation in sighting which would result from using the barrel sights alone.

Having ascertained the point for which the gun is sighted, which we will suppose to be seventy-five yards, put up a fresh target, and begin at twenty-five yards, shooting from a fixed rest, the simplest arrangement for which is a table with a seat beside it, so that the right arm may be firmly supported with a contrivance for a muzzle rest in front. Fire as many shots as will suffice to give a satisfactory average of the distance above the line at which the bullets strike. Then label the target "twenty-five yards," and replace it with a fresh one, and retire to fifty yards and repeat the operation. Then go to one hundred (no need to try seventy-five, because that has previously been found to be the point where the bullets just strike the line), then 125, 150, and so on, as far as is thought desirable, aiming always exactly at the intersection of the lines, and carefully labeling each target before laying it aside. Then measure and calculate the average distances above the line at twenty-five and fifty yards, and below the line at 100 and beyond, and it is obvious that this will show all that is needed for practical application in sporting service. And those who are not familiar with such tests will be surprised to find in many instances that rifles which they had thought very accurate, because they could make bull's-eyes with them at every shot, when the distance was measured and the sight set at the proper elevation, will shoot three or four inches above the line at twenty-five and fifty yards, and as much below at one hundred. A moment's reflection will show the hopelessness of trying to do nice shooting, when such an allowance as this must be made, and when, as in game shooting, the distance must be estimated on the instant for each shot. A really good sporting gun ought not to show a greater difference than three inches between twenty-five and one hundred yards. This would allow the aim to be taken exactly at the object for that distance, and a full bead would suffice for 150 yards.

If manufacturers would have a careful test made of the trajectories of their sporting rifles, and furnish statements setting forth the length, weight and calibre of the gun, the weight of the bullet and the weight and quality of powder, and then the distance for which the gun was sighted, and the variation of the trajectory above the line at shorter distances and below it for greater ones, it would furnish exactly the information wanted. Any gunmaker who would furnish a certificate, with every sporting rifle be offered for sale, stating the proper charge of powder and lead, and the distance for which its fixed sights were set, and containing a guarantee that the curve of its trajectory was not more than three inches in 100 yards, so that within that distance the aim might be taken exactly at the object without risk of a greater variation than one and a half inches above or below, would supply a want of sportsmen which would secure him a large custom, and drive a multitude of poor guns out of the market.

There is yet another method by which the initial velocity may be approximately determined, which is by the penetration of the bullet. It would be an exceedingly interesting and valuable contribution to the data already collected, if a properly certified statement could be furnished of the ratio, which must, of course, exist between the trajectory or the initial velocity and the power of penetration, so that one might be estimated from the other. We could then determine the trajectory simply by learning the calibre and weight of bullet, and its power of penetration. I have proved this only in a single instance, a statement of which will explain my meaning. With a rifle of 4-10th calibre, and a bullet weighing 312 grains, I get a penetration at thirty yards of eight pine boards, each one inch thick, and placed an inch apart. The same charge and bullet gives a trajectory for the first 100 yards so flat as practically to require no other change of elevation than a little fuller bead for one hundred than for fifty yards. I assume, therefore, that if a bullet of that size and weight gives such a degree of penetration, its initial velocity must be sufficient to give it a corresponding trajectory, and I deduce from this statement that a rifle of 4-10th calibre, with a bullet of the above weight, which will give eight inches of penetration at thirty yards, and can be relied on to place every shot in an eight-inch ring at 200 yards, has sufficient force and accuracy for any possible demand of sporting service for a gun of that calibre.

It is easy to see that a similar standard might be furnished for guns of any size, weight or calibre, which would enable any one to test his weapon without difficulty, but it is obvious that the ratio of penetration must change with every change of calibre and weight of gun and ammunition.

H. W. S. C.

RIFLEMEN'S RIGHTS.

HUDSON, March 29, 1878.

EDITOR FOREST AND STREAM:

It was with great pleasure I read two articles in your recent issues, whose merit, demerit, fairness and unfairness, were ably discussed. In looking over these articles, I think it proper to say a word concerning many as well as myself. The articles I have reference to are the one of Mr. Jackson, of Boston, late of the American Rifle Team, and the other, "Who Shall Select the Next Team?" Being an ardent lover of rifle shooting, and having visited Creed-

moor since 1874, and being interested more or less in long-range matches, private, national and international, and having the misfortune of being an adopted citizen, I would respectfully ask the following questions through your valuable columns, trusting that some of your readers will give some explanation on this subject. Why is it that an adopted citizen is excluded from participating in matches for the Centennial Trophy? Why cannot he compete for a place on the trophy team? Why cannot he enter in an international match with a team? I am well aware that the Irish team of 1874 required in their specifications that none but an American-born should shoot in that match, but since that time I have failed to see any such specifications or agreements from foreign teams. In international matches there may possibly be a slight excuse for the N. R. A. in excluding the complainants; but how about the "Palma." Was it not given by "Uncle Sam" to the riflemen of the world? All nations have a right to compete for it, except the adopted citizen of America (of this free and democratic country). He alone is told by the N. R. A. that he is not to enjoy the pleasure and bear the honor of competing for that national gift. The adopted citizen is excluded everywhere—cannot even enter a foreign team—because foreigners regard us as Americans, and no longer of their nationality, and if, perchance, he could enter a team from abroad, I fancy there would be criticisms on the part of some of the American riflemen, especially if he was a superior marksman. This, in my judgment, should be different. I think we should have a right to enjoy this, as other privileges; as, for instance, when a great rifle match is to be gotten up, attended with expenditures, the American-born is willing to accept the aid of the adopted shooter. When the tax collector comes none will say, "We cannot take your money: you are a stranger;" or, in time of war, will the American-born say, "Stop back, we alone will stop the enemies' bullets." When we look at the Sharpshooters' Union (Schützenbund) we find a different state of things. Although it originated among Swiss and Germans, they welcome every one, without regard to nationality. The requirements of that institution are to pay dues and maintain manly conduct. Much more could be said on this subject, but I will content myself with the above for the present, trusting that I have offended no one, and that justice may be done.

Very respectfully yours,

L. G.

Game Bag and Gun.

GAME IN SEASON IN APRIL.

Wild ducks, geese, brant, etc.

GAME IN MARKET—RETAIL PRICES, POULTRY AND GAME—Game—Partridges, ruffed grouse, per pair, \$1.50; canvas back duck, \$1.25; red head ducks, \$1.50; Brant geese, 75 cents; mallard ducks, 75; black ducks, 50; widegon ducks, 50; broad bill ducks, 50; teal ducks, 50; Wilson snipe, per doz., \$1.25, \$1.50; plover, \$2; bay birds, large and small, 75 cents; wild pigeons, flights, \$1.25; stall fed, \$2; Philadelphia squabs, \$3.50.

Poultry—Philadelphia and Bucks County dry picked chickens, per pound, 25 cents; do., fowls, 20; do., turkeys, 20; do., ducks, 20; do., geese, 15; State and Western chickens, 15; do., turkeys, 16; do., fowls, 15; do., ducks, 18; do., geese, 12; capons, 35; slips, 30; spring chickens, per pair, \$1.50; Vermont frozen turkeys, 25, 28 cents per pound.

MASSACHUSETTS—New Bedford, March 29.—Snipe shooting has commenced in good earnest hereabouts, and some fine strings have been taken. There ought to be good fall shooting in these regions, for I do not remember of seeing so many quail and partridges for some years, the mild winter having been favorable to them. Woodcock quite plenty, but now nearly all nesting.

CONCHA.

CONNECTICUT—Stamford, March 30.—English snipe have come. One was killed by Theo R. Hoyt.

H.

RHODE ISLAND—Newport, March 4.—Our local shooters for the last six weeks have had sport in shooting muskrats. No sea fowl shooting of any consequence.

SEA DUCK.

NEW YORK.—Wild geese on Lake Champlain.

NEW JERSEY—New York, March 30.—Wilson snipe up. Seven killed yesterday. Birds will be plenty for the next three or four weeks. Any one wishing the services of a good dog and experienced shot will find one in the person of John Wood at this station.

W. A. G.

A FORMIDABLE EXPEDITION.—"Jacobstaff" and a goodly proportion of the Jersey City Heights Gun Club, with several tons (more or less) of guns and ammunition, started on Tuesday for Bill Lane's, Shinnecock Bay, after geese and ducks. We prophecy a good time and good bags.

BUFFALO, March 27.—Eight snipe were shot near the city last week. Preparations for the State shoot are being made.

J. E. P.

PENNSYLVANIA—Titusville, April 1.—Our woods are full of pigeons. Hundreds are killed every day. Some English snipe along the creek.

G. H. W.

MARYLAND—Baltimore, April 1.—The snipe shooters have turned out in full force along the swamps bordering the Patuxent, but the game is not very abundant. In the piscatorial sports things are slow, also, and our lovers of the rod have to content themselves with gudgeons, which are being caught in enormous quantities. A friend and myself hooked ten dozen of them in a few hours at the Relay, B. & O. R. R., with hook and line.

TRAYMORE.

DELAWARE—Lewis, March 29.—Wilson snipe are reported plenty on the marshes.

KENTUCKY—Ashbyburg, March 24.—Every prospect for plenty of game the next season is seen. Squirrels are very plenty. Quail were not much hunted this season, and consequently there is lots for seed. Turkeys are tolerable plenty, and have been gobbling for a week or two.

PADDY O'LEARY.

—The great bald eagle of Balson Creek Range, Georgia, which has been a pest to stock raisers thereabouts for the last four years, was killed a week or two ago. The measurements were: 7 ft. 10 in. from tip to tip of wings; foot, 8 in.; claw, 3 1/2 in.

SOUTH CAROLINA—Port Royal, March 23.—I notice you have an early spring at New York. It is not very early here. There are no flight birds (waders) yet, although they usually put in their appearance by the 20th of March. We have steady cool nights.

R.

TENNESSEE—Columbia, March 25.—Squirrels are so plentiful that farmers are anxious to have sportsmen spend a week or two with them, offering to take them from and bring them back to town, and board them while hunting. I was told the other day by an old sportsman that the squirrels are more plentiful than any time since the year '59, when they were very numerous.

VAL.

Nashville, March 28.—Some few bags of jacksnipe have been made about here lately, but they are reported to be much less numerous than usual at this season. Messrs. Nicholson, Pettigrew and France, of Memphis, went over into Arkansas some time ago for a few days' shooting. Besides killing several deer, one hundred partridges (quail) and some other game birds, Mr. Nicholson, by a chance shot, succeeded in killing an enormous wolf, which had been the terror of the farmers in that neighborhood for a year or two, they having lost a number of sheep and hogs, killed, no doubt, by him.

Ohio—Painesville, March 29.—We have had snipe shooting for ten days past.

TARGET.

MINNESOTA—Eyota, March 27.—Chickens plenty this spring, and weather beautiful. Snipe have not put in an appearance yet, although the season is so forward.

VERD MONT.

St. Paul, March 30.—Shooting parties' after ducks and geese is the order of the day. The birds are here by the millions.

J. S.

IOWA—Pomeroy, March 22.—Brant, pelican, geese, etc., going north in large numbers. We expect snipe soon.

ABE DACOTAH.

Clinton, April 1.—Very few snipe coming in.

G. E. P.

THE SEASON.—Our Exchange Editor reports as much sportsman as game shot, up to date. When will people learn that a loaded gun is not a walking stick, nor a hair brush, nor a tooth pick, nor a thing to poke another man's ribs with?

WILD RICE.—Attention is called to the information in another column of the wild rice at English Lake, Indiana, and the possibility of securing the seed there.

WHAT THE DISTRACTED DOE SAID.—How happy could I be with either were 'tother deer charmer away.

DITTMAR'S POWDER.—Our California correspondent writes as follows: "I have been using Dittmar powder all winter. I mix half and half with common 'Oriental Powder,' which is the cheapest we can buy here for use in the shot-gun. It has given me the greatest satisfaction, as I can shoot all day and my gun will be as clean at night as after firing the first shot. I shoot 3 1/2 drachms of the mixture and one ounce No. 8 shot in No. 12 gun for quail. I shall use the C. Dittmar alone next season, on account of the absence of smoke, as our quail shooting is mostly in thick brush, where the smoke hangs so heavy as to obscure the sight. Some of your correspondents speak of obtaining our valley quail for breeding purposes. They can be obtained here frequently alive, in cages, for \$1.50 per dozen.

CAZADOR.

"HONOR TO WHOM HONOR IS DUE."—Mr. Editor: In your issue of March 21, under head of Answers to Correspondents, in reply to queries made by "Long Island," you say it is a difficult feat to kill 85 pigeons out of 50 double rises, and that it never has been done. I most heartily agree with you in your conclusions that it is a difficult feat. But when you say it has never been done, I most respectfully beg to differ. I find by referring to the official scores made by John Taylor, which I have before me, that in his match with Mr. King, shot at Chicago, Ill., Taylor killed 91. In his (Taylor's) match with Robert Newell, shot at Syracuse, N. Y., Taylor killed 93. Nowell killed 94. Captain Bogardus, is, without doubt, the best shot living, but in all his shooting I have yet to see where he has equaled the scores made by John Taylor. In his (Taylor's) four matches with King and Newell, he averaged 94, and, if my memory serves me right, John Taylor was the first to use glass balls in practice. Will not some of his Jersey friends enlighten us? Respectfully yours,

ELOHO.

Clinton, Ia., March 29, 1878.

A "LAND-LOOKER'S" FIND.—Here is a subject for our sensational story writers. Let it be called "The Tory Trapper of Wolf Creek." For this suggestion we only ask the privilege of a bid for the manuscript:

"W. B. Leonard, a 'land-looker,' while tramping through Alpena County, found, near Wolf Creek, sixty steel traps, a double-barreled rifle, a sheath knife and the bones of the man who once owned them."

THAT DEAF HORSE.—"Aqua" writes from Danville, P. Q., of another instance where a horse was deafened by the discharge of a gun from the wagon. We should be pleased to hear further from our Cedar Rapids correspondent:

"Last fall an acquaintance had occasion to fire a few times from his wagon. After the last shot 'old Gray' stopped short and paid no attention to the command of his master; did not start till struck with the reins, nor stop until pulled up—in fact, was 'deaf as a post.' He remained so some two or three weeks, then, all at once, he took a notion to hear again, and now his auriculars appear to be in as good working order as those of any other quadruped or biped."

—Capt. Bogardus evidently means that the Britshers shall have ample time to prepare for him this summer. He has, through the *Herald*, challenged all Europe to meet him in the field upon the occasion of his visit to the Paris Exposition, and the Britshers are up and doing, too. The captain has already received cabled acceptance of his challenge.

and white oak ribs $\frac{3}{4}$ in. square; cover the deck with heavy duck, 18 oz. I find mine very handy; it will carry six very nicely, and is light also, weighing only 92 pounds when finished, cushions, seats and all. The size of mine is as follows: Length, 12 ft.; beam, 3x4 in.; depth of pit, 10 in. Set the mast about three feet from the bow. I find my sail very useful when any distance from camp.

GEORGE R. SQUIRE.

DAUNTLESS BOAT CLUB ENTERTAINMENT.—Those who enjoyed the amateur minstrel entertainment of the Dauntless Boat Club last year will be pleased to learn that a similar treat is to be given at the Lexington Avenue Opera House tomorrow evening. The talent is composed of members of the Argonauta, N. Y. Athletic, Pioneer and Our Own Clubs. The tickets admitting lady and gentleman are \$1.

—The Neptune Boat Club, of the same city, has the following officers: Pres., Michael N. Lane, Vice-Pres., Edward L. Fanning; Sec., James Doherty; Treas., Stephen Moran; Capt., John Moran; Directors, John Murray, Geo. Brown, William White, John Moran, 2d.

COURTNEY AND TRICKETT.—Courtney has accepted the challenge of Trickett, the Australian oarsman, for a race, £1,000 a side, and allowing Trickett £300 for expenses. Courtney is to name the water.

BOATING AT NEW ORLEANS.—It is rumored that the St. John Boat Club will hold a grand Southern regatta sometime in June or July. Participating crews are expected from Charleston, Savannah, and other cities. The affair certainly might be an important event in aquatic circles.

THE WA-WA-YANDA CLUB.—A new club has been formed in this city, of which Shepard F. Knapp has been chosen President; Charles E. Loew, Treasurer, and Daniel Jackson, Secretary. The club has rented at Greenwood Lake the Jennings Cottage, on Willow Point, which will be entirely renovated and furnished as soon as the improvements are completed. The club will put on the lake a number of pleasure boats for use during their stay at the club house. The cuisine will be in charge of an experienced caterer.

NEW CANOE SEAT.—Com. R. L. Ogden, of the San Francisco Yacht Club, has invented a new seat for canoe paddles. The improvement on sitting on the bottom of the boat is simply a child's rocking chair with a low back. The rockers are prevented from any lateral motion or working by being confined in two parallel grooves of the width of the rocker, the bottom being flat rubber, to prevent wear and creaking. Over the forward end of the rocker, and screwed to the bottom, are two loops of rubber, which, as the motion of the body inclines the chair backwards with the stroke of the oar, the rubber loop resists sufficiently to bring the chair back with the forward motion, and the back of the chair is consequently flat to the back of the rower all the time, thus overcoming the greatest point of fatigue, that of the back, consequent upon the shallowness of the boat obliging the thwart to be low, and doubling the rower up, which promotes back-ache. This chair seat is of course not intended so much for short work as long pulls. It supplies the universal want felt by long-distance rowers, a support for the back. With this rocking seat, rowing is thus made easy. It is not adapted to shell boats, as there is scarcely space for placing it.

THE KING OF SIAM'S YACHT.—This is the kind of a yacht the King of Siam is to sail in. We take the description from *Land and Water*:

This yacht, just built by Messrs. Day, Sumners & Co., of Southampton, has made a very successful trial trip, although under unfavorable circumstances of weather. She is named Vesatri, which, being interpreted, means "most excellent," an aspiring, but in her case perfectly true, title. Her dimensions are as follows: Length over all, 144 ft.; ditto between perpendiculars, 120 ft.; breadth (extreme) 22 ft. 1½ in.; depth from top of keel amidships, 13 ft. 2 in.; ditto from top of floors, 11 ft. 2 in.; tonnage (builder's measurement), 275 tons; draught of water forward, 8 ft.; do. aft, 11 ft. Her hull is of best Staffordshire iron, and all wood used is of teak, with the exception of the maple and mahogany in the main saloons, and she has been built under survey of Lloyd's. Her engines are of 40-horse power nominal, on the compound principle, with all the latest improvements. At the preliminary trial, on the 30th of January, the engines developed a horse power of 264. Steam is only intended as an auxiliary, as the Vesatri has a hoisting propeller of 7 ft. 6 in. in diameter, with a pitch of 10 ft. She is fore and aft schooner rigged, and provided with full sail power, and should be fast under canvas. Her accommodation is very good, and she is elegantly fitted up throughout.

Rational Pastimes.

HARVARD ATHLETICS.—The following were the winners in the second athletic meeting: Horizontal bar, F. B. Keene, '79; light-weight sparring, first bout, F. W. Sharon, '80; second bout, L. A. Plummer, Jr., L. S. S., '79; third bout, N. E. Teschemacher, '78; Indian clubs, J. T. Howe, '80; vaulting with two hands, J. H. Tyng, L. S., 6 ft. 9 in.; tug of war, '79 vs. '80, won by '79, first heat in 10 sec., second heat in 7 sec.; '78 vs. '81, first heat won by '78 in 17 sec., second heat, '81 in 1 min. 41 sec., third heat, '81, in 1 min. 44 sec. The third meeting resulted as follows: Standing high jump, H. L. Morse, of the Scientific School; light-weight wrestling, W. A. Gaston, '80; light-weight sparring, V. W. Sharon, '80; middle-weight sparring, W. Churchill, '78. The tug of war between the Juniors and Freshmen was won by the former.

ST. GEORGE'S CRICKET CLUB.—The club grounds at Hoken have been put in a complete order by Mr. S. Giles, the professional cricketer. The annual dinner of the club is held at Delmonico's next Monday evening. The sport will begin somewhat earlier than usual this season owing to the mild weather.

AMATEUR ASSOCIATION OF AMERICAN ATHLETES.—Delegates from the Amateur, Adelphi, American, Fanwood, Greenpoint, Harlem, Knickerbocker, Plainfield, Scottish-American

and Yonkers Athletic clubs met at the Sturtevant House Monday evening and perfected the organization of the Amateur Association of American Athletes with the following officers: Pres., H. M. Gilligan, Plainfield Club; Vice-Pres., John Gath, American Club; Sec., William McEwen, Scottish-American Club; Treas., K. W. I. Kendrick, Harlem Club.

COLLEGE ATHLETICS.—The third annual convention of the Athletic Association of American Colleges will be held at the Fifth Avenue Hotel on Saturday, April 20.

—The Prospect Park ball fields are now open to all amateur clubs securing a permit from the Park office, at the Coney Island Railroad depot entrance. No field on the Parade Ground can be used without a permit.

HARVARD UNIVERSITY FOOT-BALL CLUB.—The officers newly elected are: Pres., Mr. W. S. Otis; Vice-Pres., Mr. G. R. Sheldon; Sec. and Treas., Mr. P. T. Barlow. A new practice field has been engaged, and some good play from the Harvard boys may be looked for this season.

New Publications.

—The articles on the "Evolution of Ceremonial Government," by Herbert Spencer, which are now appearing in the *Popular Science Monthly*, are of absorbing interest to the thinking reader. The facts which the writer brings forward, will prove new to most people, and the reasoning employed is so clear and simple that it can be followed without too much effort. The present paper, which is the third of the series, treats of Mutations, and is extremely thoughtful and instructive.

Another pleasant article, and one which is to be particularly recommended to readers in California and the Southern States, is on "The Encyclopaedia of the Future," by Rev. Samuel Lockwood. The cultivation of this tree is now being carried on to a very large extent on the Pacific Coast; and, indeed, it is thought by many that this wood is, in the future, to supply fuel for the whole Southern portion of California. On the other hand, we are told by others equally enthusiastic on the subject of Eucalyptus culture, that timber furnished by this tree is substantially incombustible, and that houses built of it will be virtually fireproof: who shall decide which of these views is the correct one? Other interesting articles are Prof. Marsh's "Address on Vertebrate Life in America," "On Weasels," "Edison's Talking Machine (the Phonograph)," "Living Corals," etc.

The Editor's Table is lively and attractive, and the Literary Notices and Popular Miscellany full of interesting matter.

—DE WITT'S BASE BALL GUIDE. This handbook claims to be a complete manual of the national game and certainly contains enough matter to entitle it to that claim. There are full instructions, records and rules; we commend the book as all that is necessary. Published by Clinton T. Devitt, 33 Rose St., N. Y. Price 10 cents.

The Game of Chess.

NOTICE.—Chess exchanges, communications and solutions should be addressed "Chess Editor FOREST AND STREAM, P. O. box 54, Wolcottville, Conn."

Problem No. 12.

Tourney set, No. 8. Motto: E pluribus uno.

White to play and give mate in two moves.

SOLUTIONS TO PROBLEMS—NO. 10.
1—Q-Q5 ch. 1—Any
2—Mate accordingly.

Game No. 38.—VIENNA OPENING.

This and the following games are variations translated from the Handbook:

White.	Black.	White.	Black.
1—P-K4	1—P-K4	10—P-K Kt3	10—Q-K B3 (e)
2—Kt-K B3	2—Kt-K B3 (a)	11—B-Kt3	11—Kt-B6 ch
3—P-K B4	3—P-Q4	12—Kt-Kt3	12—Q-Kt3
4—P-Q3	4—P-Kt3	13—Q-Q2	13—Q-Kt3 ch
5—P-Kt3	5—Kt-Kt3	14—Q-Kt3	14—Q-Kt3 ch
6—P-Q4 (b)	6—P-K6	15—Kt-B3	15—B-K3
7—B-Q B4 (c)	7—Kt-Kt3	16—K-K B3	16—P-K B3
8—B-Q Kt3	8—B-Kt5		Even game.
9—Kt-K2	9—Q-R5 ch (d)		

NOTES.

- (a) If Black play 2—P-K B4, then 6—P tks P follows, and the game is similar to a Bishop's or King's Gambit, without, however, having the advantage of Kt-Q B3. Dr. M. Lange recommends B-Q Kt4 as the best continuation for Black on his third move.
- (b) Steinitz and Neumann continued (*Neue Berliner Schach Zeitung*, 1870, p. 245) Kt tks P, 6—Kt tks P; 7—P-Q4, 7—Kt-K Kt3; 8—Kt-K B3, etc.
- (c) This variation is taken from a game between Gnietzky and Panis, (*Schach Zeitung*, 1860, p. 183). If Black move 7—Kt-Q B3, then 8—B-Q Kt3, 8—Q-R5 ch; 9—K-B3, 9—B-Q2, etc., as in the *Quarterly Chronicle*, 1870, p. 168; also in "Lowenthal," 1861, p. 7.
- (d) If 9—Kt-K Kt3 the game is about equalized.
- (e) The following gives White the superiority, viz.: 10—B-Kt3; 11—Q tks B, Q tks P, or Q-K5; 12—B tks K P.

Game No. 39.—VIENNA OPENING.

The first seven moves are the same as in the preceding game:

White.	Black.	White.	Black.
8—B-Q Kt3	8—Kt-K Kt5	13—Kt-Kt3	13—B-Q B4
9—Q-K B3	9—Q-Kt3	14—P-K B3	14—Kt-K B7
10—Q tks B P ch	10—K-Q	15—Kt-K B3	15—Kt-K B7
11—K-K2	11—Q-K1	16—B tks K P	16—B tks B
12—Q-Q5 ch	12—Q tks Q		White has the best game.

Game No. 40.—VIENNA OPENING.

The first moves are the same as in Game No. 38:

White.	Black.	White.	Black.
2—Kt-Q B3	2—Kt-Q B3	16—P-Q4	16—Q-Kt-K2 (e)
3—P-K B4 (a)	3—P tks B P	17—Kt-Q4	17—P-K B3
4—Kt-K B3	4—P-K Kt4	18—B-Kt5 ch	18—Kt-K
5—B-Q B1	5—B-K Kt2 (b)	19—Kt-K2	19—Kt-K B3
6—Castles	6—P-Q3 (c)	20—Kt-K B1	20—Kt-Kt3
7—P-Q4	7—P-Kt3	21—B tks Kt	21—B-K4
8—P-K Kt3	8—B-Kt6 (d)		Black has the best game.
9—Kt-K B3	9—P-K Kt5		

NOTES.

- (a) The *Quarterly Chronicle*, 1871, p. 326, gives the following continuation: 8—Kt-K B3, 9—B-Q B4; 4—Kt tks K P, 4—B tks B P ch; 5—K tks B, 5—Kt tks K; 6—P-Q1, 6—Q-B3 ch; 7—K-Kt7, 7—Kt-K Kt5.
- (b) In a game between Earl Czernin and Friederich, Black attains a position similar to the Muzio Gambit, in which he has the advantage by 6—P-K Kt4; 6—Castles.
- (c) If 6—P-K Kt4; 7—Kt-K, and the K B P cannot be maintained. Lowenthal, 1864, p. 8, moved 7—P-Q8, and P-Q5?
- (d) 8—P-K Kt4 gives no advantage here. This variation, which is taken from a game in the *Schach Zeitung*, 1861, p. 385, is identical with the King's Gambit.
- (e) Snhlle and Neumann, 1865, p. 193, consider 13—Kt-Q R4 better.

Game No. 41.—VIENNA OPENING.

The first three moves are the same as in Game No. 40:

White.	Black.	White.	Black.
4—P-Q4 (a)	4—Q-R5 ch	12—P tks Kt	12—B-Q B1
5—K-K3	5—P-Q4 (b)	13—Q-K	13—Kt-K B5 ch
6—Kt tks Q P (c)	6—B-K Kt5 ch	14—K-Q	14—Kt-K ch
7—Kt-K B3	7—Castles Q R	15—B-Q3	15—Kt tks Kt P
8—B tks K B P (d)	8—Kt-K B3	16—Q tks Q	16—Kt tks Kt
9—B tks Q B P	9—R tks Kt	17—Kt-K B3	17—Kt tks Kt
10—P tks Kt	10—Kt tks P		Black has a winning game.
11—B-K5	11—Kt tks B		

NOTES.

- (a) This quaint and, in appearance, highly dangerous move, Steinitz first introduced at Dundee, Scotland, in 1867, and afterwards at Baden-Baden in 1870. It is similar to an antiquated gambit in the days of Lopez and Selenus, viz.: 1—P-K4, 1—P-K4; 2—P-K B4, 2—P tks P; 3—P-Q4.
- (b) Zukertort continues the game (*Neue Berliner Schach Zeitung*, 1871), giving Black the advantage, which, however, is not the case.
- (c) The following continuation is of no benefit: 6—P-K5, 6—B-K Kt5 ch; 7—Kt-K B3, 7—Castles Q R; 8—B tks K B P, 8—P-K B3; 9—B-K Kt3, 9—Q-R4; 10—P tks P, 10—Kt tks P, with a good game. Or, 6—P-K Kt3, 6—P tks P (6—B-K Kt5 ch; 7—P tks B, 7—Q tks R; 8—Kt-K B3, 8—P tks P; 9—Kt tks P, 9—Castles Q R; 10—P-Q B3, and the Q cannot be retreated without making a sacrifice), whereby Zukertort gives Black a good game by the following continuation: 7—Kt tks P, 7—Q-K2; 8—K-B3, 8—B-K B4; 9—Kt-K B3, 9—Castles Q R; 10—P-Q B3, 10—P-K Kt4.
- (d) The following yields White no advantage: 8—P-Q B3, 8—P-K B4; 9—Q-Q3, 9—P tks P; 10—Q tks P, 10—P-K Kt4; 11—B-Q2, 11—B-K Kt3. In next week's issue we shall conclude the variations on this Vienna Opening, and commence the publication of the *Handbuch* variations on the Roy Lopez Opening.

Game No. 42.—PETROFF DEFENCE.

White.	Black.	White.	Black.
1—P-K4	1—P-K4	5—Q-Q3	5—Q-K1
2—Kt-K B3	2—Kt-K B3	6—P-Q3	6—Kt-K B3
3—Kt tks P	3—P-Q3! (a)	7—Q tks Q ch	7—B tks Q
4—Kt-K B3	4—Kt tks P		Even game.

NOTES.

- (a) This move was first published by Cozio, 1766, vol. I., p. 214; and in 1842, after Petroff had played it often, closely analyzed by Jaenisch.

Game No. 43.—PETROFF DEFENCE.

The first four moves are the same as in the preceding game:

White.	Black.	White.	Black.
5—P-Q3	5—Kt-K B3	8—Castles	8—Castles
6—P-Q4	6—P-Q4	9—P-Q B4	9—P-Q B4
7—B-Q3 (a)	7—B-Q3		Even game.

NOTES.

- (a) The position is obtained in the Queen's Gambit by the following moves: 1—P-K4, 1—P-K4; 2—P-Q4, 2—P-Q4; 3—P tks P, 3—P tks P; 4—Kt-K B3, 4—Kt-K B3, etc.

CHESS DIRECTORY.

The following is the locale of the several chess clubs and chess rooms of New York and Brooklyn:

New York Chess Rooms.—101 East 11th st., corner of Union Square; Captain McKenzie, Manager.

Turner Ball Chess Club.—Nos. 66 and 68 East 4th st.

New York Chess Club.—Cafe Cosmopolitan, No. 1½ Second ave.

Manhattan Chess Club.—Cafe Loggery, No. 49 Bowery.

The Brooklyn Chess Club meets Wednesdays and Saturdays at 7 P. M. in the Mercantile Library Building, Montague st.

Williamsburgh Philidor Chess Club.—No. 212 Graham ave.

CORSORY JOTTINGS.

—The chess players of Great Britain engaged in the International Match are "dealing out destruction" to the American team, having already scored 3 games to 2. This great contest appears thus far to have been negligently and carelessly conducted on the part of the American team. Bro. Belden should "coach" them up a bit, and be right smart about it, too.

—The New York Chess Club handicap tourney is now in full operation. One game only is played. There are thirty contestants, and the following players take the lead:

	Won.	Lost.	Dr'wn.		Won.	Lost.	Dr'wn.
Mr. Burke.....	7	1	2	Mr. Lumbec.....	6	0	2
Mr. Ettinger...	6	3	8	Mr. Ryan.....	6	8	2
Mr. Henshel....	11	2	4				

Three money prizes are offered, \$50, \$30, \$20, and a fourth consisting of an initial chess board, has been promised; the first prize of \$50 and the chess board being presented by Mr. H. Hoennack, the liberal proprietor of the Cafe Cosmopolitan, where the New York Chess Club has its rooms.

—The Brooklyn Club tourney is proceeding slowly. It would not be consistent for it to go fast. A consultation match is on the tapis for next Saturday night.

—Mr. W. A. Shinkman carries off the prize for the best two moves, and Mr. F. W. Martindale ties with an unknown for the best four moves, entered in the *Hudersfield College Magazine* Problem Tourney, just ended. The enterprising editor of this popular and attractive publication announces another tourney, wherein several prizes are offered for a set and single problems, not to exceed three in number, forwarded him within the time limited.

THE FIGHTING DOG.

A man, he owned a Terrier dog—
A bob-tailed, onery cuss,
And that there pup got that there man
In many an ngly mize;
For the man he was on his muscle,
And the dog he was on his bite;
So to kick the dog-goned animal
Was sure to raise a fight.

A woman owned a Thomas cat,
That fit at fifteen pound;
And other cats got up and slid
When that there cat was round.
The man and his dog came along one day,
Where the woman she did dwell,
And the pup he growled ferociously
Then went for that cat pell-mell.

He tried to claw the neck of the cat,
But the cat he wouldn't be charred,
So he lit on the back of that there dog,
And bit! and clawed! and clawed!
Oh! the hair it flew! and the pup he yowled!
As the claws went into his hide,
And chunks of flesh were peeled from his side;
Then he flummoxed, and kicked, and died!

The man he ripped, and cursed, and swore,
As he gathered a big brick-bat,
That he would be damned essentially
If he didn't kill that cat!
But the old woman allowed she'd be blessed if he
Did!

And snatched up an old shot-gun,
Which she fired and peppered his diaphragm
With bird-shot number one.

They toted him home on a window blind,
And the doctor cured him up;
But he was never known to fight again,
Or own another pup.
Folks may turn up their snoots at this here
rhyme,
I don't care a cuss for that!
All I want to show is, that fighting dogs
May tackle the wrong Tom cat.—*Ex.*

THE "SETTER" HORSE.—We have heard
this story before, but never heard Mr. Lin-
coln's name in connection with it. In the
April *Scribner's* Mr. Noah Brooks gives it as
told by that President:

"A young gentleman in Tennessee was
once traveling a country road, mounted on a
fine black racing horse of great value. His
casual companion was a shrewd old fellow,
who was known in those parts as a Yankee,
and rode a rack-o'-bones of a horse, appar-
ently hardly able to stand on his feet. The
Yankee bantered the Southerner for a horse
trade, which, of course, the Southerner in-
dignantly declined. The Yankee, however,
insisted that his was a very remarkable horse,
of what was known as the setter breed,
which sets for big game as a dog sets for
small game, and that as animals of this
breed were very scarce, his horse was ac-
cordingly valuable. The Yankee soon had
an opportunity to demonstrate the truth of
his statement, as his had the peculiarity of
dropping on all fours when touched in a cer-
tain spot by the spur or the heel of the rider.
The Yankee seeing a deer on a knoll not far
away, touched his raw-bones in the tender
spot, and, sure enough, down he went on
all-fours, assuring the Southerner there was
game ahead. The would-be-horse-trader
told the Southerner that there must be game
near by, for his horse never 'set' in that
way except when on the scent for game.
Immediately after, the deer made its appear-
ance to the Southerner, who succeeded in
bringing him down, and so much pleased
was he with the wonderful instinct of the
horse that he immediately swapped off with
the Yankee, on even terms. Soon after they
came to a stream which the Yankee, mounted
on the Southerner's horse, crossed in good
style; then standing on the opposite bank,
he looked back after his companion. The
'setter horse' had sunk, his head being
hardly above water; his rider was dis-
mounted and nearly drowned. Reaching
the bank and blowing the water from his
mouth, he exclaimed: 'Here, you infernal
Yankee! what kind of a horse is this to drop
on his knees in the middle of a stream?'
'Hush! hush!' replied the Yankee, 'keep
perfectly quiet. That's a setter horse; he
sets for fish as well as for deer, and I tell you
there's game there!'

STRAW FUEL.—The Russians in the Men-
nonite settlement of Nebraska have intro-
duced simple furnaces for burning straw.
One of these furnaces only costs \$5 for the
iron work, the rest being made of brick or
clay. By proper use a ton of straw will go
more than half as far as a ton of coal for
fuel. The Mennonites twist the straw into
hard rolls, or press it into hard cakes, so
that it burns as well as wood, and gives off
as much heat. One of these furnaces, sup-
plied with fuel only three times a day, will
keep a house warm the whole twenty-four
hours, besides doing the cooking. As coal
is costly, and wood still more so, and as
most Western farmers have heretofore
wasted their straw, the Mennonite plan of
preparing and using it for fuel is an economy
which will prove of great value to the prairie
States, and it is rapidly extending among
the Americans. Of course American inven-
tion will speedily supply handy machines
for pressing the straw into cakes, and im-
proved stoves for burning it.—*Detroit Tele-*
graph.

HIGH ART IN NAPKINS.—A Washington
waiter has issued a challenge to the whole
world to produce his equal in the art of fold-
ing napkins, the match to come off at Sara-
toga in June or July next. The winner has
to look to the admiration and applause of
those colored gentlemen whose summering at
Saratoga adds an otherwise unattainable ton
to the place as his reward.

A CURIOUS HOUSE PLANT.—The spray of
the carrot is of a handsome green and quite
ornamental. In 1629 carrot leaves were worn
by ladies in England in place of feathers, and
London says that an elegant ornament for a
sitting room is formed by cutting off a sec-
tion of the head or thick end of a carrot, con-
taining the buds, and placing it in a shallow
vessel of water. Young and delicate leaves
unfold themselves, forming a radiated tuft of
a very handsome appearance.

—If six cats can kill six rats in six min-
utes, how many cats will you require to kill
one hundred rats in fifty minutes.

—A young man who went to Texas last
spring has telegraphed home to his father:
"Fatted calf for one."

Tiffany & Co., Silversmiths,
Jewellers, and Importers, have
always a large stock of silver
articles for prizes for shooting,
yachting, racing and other
sports, and on request they pre-
pare special designs for similar
purposes. Their TIMING
WATCHES are guaranteed
for accuracy, and are now very
generally used for sporting and
scientific requirements. TIF-
FANY & CO. are also the agents
in America for Messrs. PATEK,
PHILIPPE & CO., of Geneva, of
whose celebrated watches they
have a full line. Their stock of
Diamonds and other Precious
Stones, General Jewelry, Artis-
tic Bronzes and Pottery, Electro-
Plate and Sterling Silverware
for Household use, fine Station-
ery and Bric-a-brac, is the
largest in the world, and the
public are invited to visit their
establishment without feeling
the slightest obligation to pur-
chase.

UNION SQUARE, NEW YORK

The Great European Novelty
HUNYADI JANOS.

The Best Natural Aperient.

THE LANCET.—
"Hunyadi Janos.—
Baron Liebig affirms
that its richness in
aperient salts sur-
passes that of all other
known waters."

THE BRITISH
MEDICAL JOUR-
NAL.—"Hunyadi Jan-
os.—The most agree-
able, safest, and most
efficacious aperient
water."

PROFESSOR VINCOW, Berlin. "Invariably good
and prompt success; most valuable."
PROFESSOR BAMBERGER, Vienna. "I have pre-
scribed these Waters with remarkable success."
PROFESSOR SCANZONI, Wurzburg. "I prescribe
none but this."
PROFESSOR LAUDER BRUNTON, M. D., F. R. S.,
London. "More pleasant than its rivals, and sur-
passes them in efficacy."
PROFESSOR AITKEN, M. D., F. R. S., Royal Mil-
itary Hospital, Netley. "Preferred to Pulina and
Friedrichsbad."

A WINEGLASSFUL A DOSE.

Every genuine bottle bears the name of "The
Apollinaris Co. (limited)," London.

FREDERICK DE BARY & CO.,

41 and 43 Warren Street, New York.

Sole Agents for United States and Canada,

FOR SALE BY DEALERS, GROCERS AND
DRUGGISTS.

Publications.

The Book for Pigeon Fanciers.

THE ILLUSTRATED
Book of Pigeons.

A thorough and complete treatise on Pigeons, giv-
ing full and explicit directions for their care and
management, construction of nests and perches,
fitting up of lofts, and colored illustrations of the
various varieties, and standards for judging.

BY R. FULTON.
EDITED BY LEWIS WRIGHT.

ILLUSTRATED WITH
Fifty Colored Plates,
And a great number of
WOOD ENGRAVINGS.

Uniform in size and style, with the "Illustrated
Book of Poultry." Cloth, extra, \$12.50;
half Morocco, \$17.50.

CONTENTS.

Sportsmen's Goods.

HIGHEST HONORS
AT THE
Centennial World's Fair, 1876!
THE
SHONINGER ORGAN

PRONOUNCED UNANIMOUSLY AS THE
Best Instruments.

Their comparative excellence is recognized by the
Judges in their Report, from which the following
is an extract:

"The SHONINGER ORGAN CO.'S exhibit
as the best instruments at a price rendering them
possible to a large class of purchasers, having a com-
bination of Reeds and Bells, producing novel and
pleasing effects, containing many desirable improve-
ments, and stand longer in dry or damp climate, less
liable to get out of order, all the boards being made
three-ply, put together so it is impossible for them
to either shrink, swell or split." THE ONLY
ORGANS AWARDED THIS HONOR.

There are 50,000 of our instruments in this and
the European countries in use, and they are so made
that they will keep in tune, and stand any climate.
They contain a magnificent Chime of Bells, tuned in
perfect harmony with the Reeds, producing wonder-
ful effects. The Music Rack, when tuned forward,
will make a splendid writing desk, with our Book
Closets and Swinging Lamp or Flower Brackets, with
a fine stool boxed free with each Organ, makes the
SHONINGER ORGAN the most substantial, con-
venient and perfect Organ.

ESTABLISHED 1850.

We are prepared to appoint a few
new Agents.

A liberal discount to the Clergy, Sunday Schools,
Teachers, Churches and Lodges.

Illustrated Catalogues, with prices, sent by mail
upon application to

Guns, Etc.

GUNS
Cheap.

Below will be found my last list of second-hand
shot-guns for this season. But two of these have
ever been advertised before:

GREENE—Tribble-wedge fast; 10-bore, 80-in.
barrels, 8 1/2 lbs.; all improvements; will make
average penetration of over 200 with No. 7
shot at 40 yards, 30-in. circle; cost last Octo-
ber, \$250; price, \$165.

RIGBY—Highest quality; 12-bore, 7 lbs.; ele-
gant Damascus barrels, in solid leather case;
cost \$225; price, \$175.

R. M. REILLY—This gun was made to order
without engraving; 12-bore, 7 1/2 lbs., Danas-
cus barrels; in good condition, in best English
case, with complete set of finest implements;
cost \$275; price, \$175.

SCOTT—Slide lever, 10-bore, 9 1/2 lbs., fine lam-
inated barrels; in good condition; cost, new,
\$125 gold; price, \$90.

SCOTT—Double grip, 8-bore, 34-in. barrels, 13
lbs. weight; no engraving; very fine; cost,
new, \$160; used one month; price, \$125.

SCOTT—Slide lever, 10-bore, 21-inch, 10 1/2 lbs.
weight; nearly new; cost \$120; price, \$70.

G. LARLEY, Leicester, England.—This gun,
double grip action, 12-bore, 1 1/2 lbs. weight;
elegant Damascus barrels, horse-shoe bridge,
rebouncing locks; in case with implements.
This is one of the very finest guns, and cost
originally \$275; made to order in best manner
and as good as new; present price, with case
and implements, \$135.

TOLLEY—Double express rifle, .40 cal., 5 drms.
powder, 9 lbs. weight; the very finest in every
particular; new and complete; original cost,
\$275 gold, \$175.

BLISSARD—Slide lever, laminated steel barrel,
12-bore, 7 1/2 lbs. weight; nearly new, in good
leather case, for \$50.

WESTLEY RICHARDS—Muzzle-loader, 10-bore,
8 1/2 lbs. weight; in good condition; original
cost, \$125; present price, \$35.

A very fine German breech-loader, made at a
cost of over \$300; elegant Damascus barrels
and finest locks, at \$150.

Also another, cost \$125, for \$50.

These Guns are all sold at great sacrifice. Each
gun is exactly as represented, and will be sent for
examination on satisfactory reference or receipt of
sufficient money to pay express charges.

HENRY C. SQUIRES,

1 Cortlandt St., New York.

A BRAND NEW BREECH-
LOADING RIFLE FOR \$5
"The biggest bargain
we ever offered."

And they are just as they come from the manufac-
ture's hands.

BRAN NEW, PERFECT,

AND

GOOD SHOOTERS,

GUARANTEED. This rifle cost \$15 to
make, and cannot be replaced for that sum. The
failure of the owner, and the subsequent con-
fession of the manufacturer, is the only reason
for the sale of this rifle at this
price. They are very finely finished, with care-
hardened locks, blue mountings, and handsomely
finished black-walnut stock.

BARREL IS OF THE BEST STEEL

FINELY RIFLED.

The lock and graduated sight alone cost \$5, and as
handsome and well-made a rifle cannot be bought
in the United States for \$5. The loading arrange-
ment is a drop action, similar to a Remington or
the simplest and best. Every man and boy
in this country who needs a rifle
should purchase one of these guns.

For

TARGET SHOOTING

HUNTING.

Or Trade, they are worthy of your attention. Even
a bargain will never be offered again.

We have furnished several Rifle Clubs with
this rifle, and have received many prizes for their
shooting qualities. Order at once and say that you
want our New Union Rifle, so as not
to conflict with former advertisements. Re-
member that these guns are
Brans New, cost the manufac-
turer over \$15 apiece, and that
we guarantee them as re-
spected. Where parties wish to see them,
heretofore, send adequate express receipt by
mail.

Goods Packed Free and Sent

Promptly.

We respectfully refer for our reliability to
any Gun House in the country, the edi-
tor of any Boston paper, and to any of the
Express Companies in this city.

Cartridges, 500, box, metallic re-
loadable shells (last a lifetime), 50c.
a box.

G. W. TURNER & ROSS,

26 Central St., Boston, Mass.

The editor of the "Boston
Globe" says: "Messrs. Turner &
Ross have offered many induc-
ments to gun buyers, and their new
rifle is the most unparalleled
bargain ever offered; it is well
worth \$25, and we know that the firm is perfectly reliable."
Send money by P. O. order or registered letter, at our risk,
or deliver to your Express agent, and that company will pay
for the rifle and deliver it to you.

DOGS PURCHASED IN EUROPE.

During my visit to England I will purchase for any gentleman such dogs as he may require or fancy—more especially beagles, fox terriers, collies, liver saddle pointers, pugs, and all the terrier class. Gentlemen will please state the highest figure they are willing to give, and the money must be deposited at my bankers, in New York City, I to incur no further liability after seeing the dogs on board in good condition in England. Address CAPT. TAYLOR, Bellefont, Newway Co., Va., up to the 25th. Can be seen personally at this office Monday and Tuesday, April 1 and 2.

SPIKE COLLARS.—Spike Collars, by means of which dogs of any age or breed, no matter how long haired, or what the disposition, can be taught to fetch and carry, and to retrieve game in a most perfect manner, with no play about it. Dogs broken of gun-shyness and whip-shyness, made steady before and behind, and "to heel" steadily; prevents tugging on the chain, besides a much more extended sphere of usefulness. Price, with directions for using, \$3. Kennel collars, which no dog can get over his head, price \$1. Address M. VON CULIN, Delaware City, Del.

FOR Irish and native setters, dogs and bitches of all ages, broken and unbroken, address E. J. ROBBINS, Wethersfield, Conn.

THE DOG BREAKER'S GUIDE.—Train your own dogs in the most artistic manner. "The Dog Breaker's Guide" and for three cent stamp, M. VON CULIN, Delaware City, Del.

FOR SALE.—A well-bred Newfoundland dog, one and a half years old; kind and gentle with children; broken to harness, and a good watch dog; took second prize at London Bench Show, September, 1877. Weight, 120 pounds. Price \$30. Apply SEC. L. CLUB, London, Ont.

ENGLISH PRIZE, STUD, SPORTING AND NON-SPORTING DOGS for sale. Greyhounds, pointers, setters, retrievers, spaniels, broke for the field, £20 each; for the field and show bench, of good pedigree, £40 each; fox terriers, bull terriers, black and tan terriers, from £10 each, all dead game, of good pedigree, and very valuable for breeding; better quality for the show bench, £20 each. Also a few Yorkshire terriers, at £10 each. The prize Yorkshire terrier, "Willie," will be sold. Winners of silver cup, Queensbury, first and silver cup Ulverston, and ten other prizes. All dogs will be sent to Messrs. Bampton & Steglisch, Express Agents, 60 William street, New York. Drafts to accompany order, payable on Alliance Bank, London. Satisfaction is guaranteed by the advertiser, who is a judge and reporter of English dog shows. F. STEEL, Well Royd Farm, Stump Cross, Halifax, England.

FOR SALE.—A pair of black and tan dachshunds, dog and bitch, eight months old, from first-class stock. Inquire at 406 Third Avenue, WM. H. GOETTINO.

For Sale.

FIELD, COVER AND TRAP SHOOTING.

BY CAPT. BOGARDUS.

New and enlarged edition, containing instructions for glass ball shooting, and chapter on breeding and breaking of dogs by Miles Johnson. For sale at this office. Price \$2.

Black Rock, Scarborough, Me., For Sale.

The house is roughly finished, has eight sleeping rooms, and is located a half mile from Pine Point Station, B. & M. R. R., 2 1/2 miles from Oak Hill Station, E. R. R. Boating, fishing, bathing and shooting. Plovers, ducks, snipe, etc., on the famous Scarborough Marshes. Fine sea-fowl shooting in autumn, winter and spring. Woodcock covers within a few miles. This place has a commanding view, and is desirable for a summer resort or residence, or for a small club of sportsmen. An unusually favorable locality for raising fowl. For full particulars, address EVERETT SMITH, Portland, Me.

FOR SALE.—50,000 Trout Fry for sale at the Oscawana Trout Farm. \$6 per thousand for 20,000 and upward. Address B. ODELL, Cougars, N. Y.; or, H. P. DE GRAAF, 62 Bowery.

TROUT PONDS FOR SALE.—At Westport, Conn., forty-five miles from New York by the New Haven RR; ponds stocked; never-falling springs of purest water; hatching houses; nice dwelling-house and stable on premises, one mile from village. Apply to SYMPER & CO., 693 Broadway.

FOR SALE.—Remington-Union Rifle, 44-cal., pistol grip, Verner wind gauge, with extra front sights, 100 new shells, reloader, etc.; nearly new; perfect order; beautiful shooting gun. Sold only for want of use. Cost \$110; price \$80. DR. RAYMOND, 8 East Thirty-fourth street, N. Y.

Wanted.

TROUT FISHING.—Advertiser wishes to hear of a good pond (club or private) where he can have a few days' fly-fishing; will pay usual rates for fish killed. Address, with full particulars, FLY, box 2,919 Post-office, New York.

FARMING.—A man of many years' experience in extensive farming operations in the northwest, desires to make the acquaintance of a capitalist of considerable means, with a view of opening a wheat and stock farm on a large scale; land of the best quality for this purpose already secured. For particulars call on the editor of this paper.

WANTED.—100 live Quail; also, twelve gray or black Squirrels. Address B. ODELL, care H. P. De Graaf, Bowery National Bank, New York.

WANTED.—One or two children to board, by a lady having a pleasant country home, thirty-three miles from New York, in a very healthy locality; reasonable terms and best of care for satisfactory parties; reference, the Editor of this paper. Apply to Mrs. H. E. WALKER, Tallmans, Rockland County, N. Y.

Auxiliary Rifle.

SHELTON'S Auxiliary Rifle Barrel for Breach-Loading Shot-Guns.

This barrel can be placed in a gun ready for use in a second of time with the same ease as a cartridge, and can be removed just as expeditiously. There is no wear on the rifle barrel, nor on the shot-gun, and it cannot get out of order. With this Auxiliary Barrel, which weighs about one pound, almost instantly a breach-loading shot-gun can be converted into a most accurate rifle. The AUXILIARY BARREL will fit any standard make of gun of 10 or 12 calibre—calibre of rifle 32, 38, or 44, as desired. Length of barrel, twenty inches. Any central-fire metallic cartridge can be used. Also, the RYKLAESTING SHELL or shells can be loaded by the person using the rifle. Send for a Circular and Price List.

Gunpowder.

THE HAZARD POWDER CO.

MANUFACTURERS OF

GUNPOWDER.

Hazard's "Electric Powder."

Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. only.

Hazard's "American Sporting."

Nos. 1 (fine) to 6 (coarse). In 1 lb. canisters and 6 1/2 lb. kegs. A fine grain, quick and clean, for upland prairie shooting. Well adapted to shot-guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6 1/2 and 12 1/2 lb. kegs. Burns slowly and very clean, shooting remarkably close and with great penetration. For field, forest or water shooting, it ranks any other brand, and it is equally serviceable for muzzle or breech-loaders.

Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting" FG, in kegs of 25, 12 1/2 and 6 1/2 lbs. and cans of 5 lbs. FFG is also packed in 1 and 1/2 lb. canisters. Burns strong and moist. The FFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard Rifle powder of the country.

Superior Mining and Blasting Powder.

GOVERNMENT CANNON & MUSKET POWDER. ALSO, SPECIAL GRADES FOR EXPORT OF ANY REQUIRED GRAIN OR PROOF, MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's Agents in every prominent city, or wholesale at our office.

88 WALL STREET, NEW YORK.

Lafin & Rand Powder Co.

No. 28 MURRAY ST., N. Y.

Sole Proprietors and Manufacturers of

Orange Lightning Powder.

No. 1 to 7, strongest and Cleanest made. In sealed 1 lb. canisters. Higher numbers specially are recommended for breech-loading guns.

Orange Ducking Powder,

For water-fowl, strong and clean. No. 1 to 5 in metal kegs, 6 1/2 lbs. each, and canisters of 1 and 5 lbs. each.

Orange Rifle Powder.

The best for rifles and all ordinary purposes. Sizes, FFG, FFG, and FFG, the last being the finest. Packed in wood and metal kegs of 25 lbs., 12 1/2 lbs. and 6 1/2 lbs., and in canisters of 1 lb. and 1/2 lb.

All of the above give high velocities and less recoil than any other brands made, and are recommended and used by Capt. A. H. BOGARDUS, the "Champion Wing Shot of the World." BLASTING POWDER AND ELECTRICAL BLASTING APPARATUS. MI ITARY POWDER of all kinds on hand and made to order. Safety Fuse, Frictional and

Platinum Fuses. Pamphlets, showing sizes of the grain by wood cut, sent free on application to the above address.

Sportsmen's Goods.

A WHITE RIBBON, Blue Ribbon AND SILVER MEDAL

Were awarded to Messrs. G. W. SIMMONS & SON, of Boston, Mass.,

Through their agents and exhibitors Messrs. Brown & Hilder, of St. Louis, Mo., at the Exhibition of the "St. Louis Bench Show and Sportsmen's Association," for an unusually fine display of Duck, Molestin and Leather

HUNTING SUITS,

which attracted great attention and were much admired by all Sportsmen.

THE BOSTON SHOOTING SUIT.

Manufactured only by

G. W. SIMMONS & SON,
BOSTON, MASS.

NEW YORK AGENTS:

Fowler & Fulton,

300 BROADWAY,

The Best in Use.

ONLY ONE QUALITY MADE, AND THAT IS THE VERY BEST.

Flexible Waterproof, Tan-Color Duck.

Each article—coat, trousers, vest and hat cap—has the name and manufacturers' address stamped upon it, and no suit is genuine without it bears this imprint.

We make no discount except to the trade. The price of the suit complete is \$13.

The material is of the best quality of duck, waterproofed by a patent process. The color is that known as "dead grass shade."

The seams and pocket corners are copper-riveted, and nothing is neglected to make the whole suit complete in every way.

This is what one of our best sportsmen says of it, writing from camp: "Although I had been nearly eight hours under incessant rain, laboring and striving along under adverse circumstances, yet I found myself comparatively dry, and my clothes without a tear. For the benefit of our brother sportsmen, let me advise one of Messrs. Simmons' (of Boston, Mass.) Waterproof Suits. Oh! what a relief it was to find one's tobacco was dry, and that one could light a pipe; that you could laugh at your miserable friend, who stood shivering and shaking as if he had the palsy; and then, next morning, oh! what fun it was to see him mending his clothes, while I had not a tear to complain of! Ventilation, that great bugbear of waterproof suits, is legislated for in the most ingenious manner. No sportsman should fail to supply himself with a suit which is at once cheap, practical, and will last an almost indefinite time."

Our Flexible Tan-Colored Water-Proof Leather Coats, Breeches, Vest, Leggings, and Caps are considered the finest things ever made.

H. M. QUACKENBUSH, Patentee and Mfr, Herkimer, N. Y.

Hart's Sportsman's Favorite Metallic Shells. FOR BREECH-LOADING SHOT GUNS.

These Shells are easily loaded, and the caps easily extracted from inside. Head solid and much thicker than any shell now made, giving a solid seat for cone or anvil, which prevents it from driving through or springing away, thereby causing miss-fires. The Cone is made of nickel, and fastened solid in its place. Neither rusts nor corrodes fast, like movable anvil made from steel. The Nickel Cone also prevents miss-fire when a cap has been left on shell for a few days, which is liable to occur either in street or iron. These Shells are finely finished, and made any length ordered, from 2 1/2 to 3 1/2 inches. Shells and Loaders and Descriptive Price-Lists can be obtained from all the leading Sportsmen's Houses throughout the country.

FROM CAPTAIN BOGARDUS, CHAMPION WING-SHOT OF AMERICA.
MESSRS. GEORGE E. HART & CO.—Gentlemen: The fifty Shells I received from you to-day suit me better than any I have ever used. They are stronger and better in every respect, and I shall use them in all my shooting hereafter.
Yours truly,
A. H. BOGARDUS.

W. W. Greener's Champion Treble Wedge Fast, Breech-Loader.

THE WINNING GUN.

The winning gun also at Philadelphia, 1876, in the pigeon shooting match between Capt. Bogardus and Mr. South for \$500 a side, South killing 86 birds out of 100, using one barrel only.

The winning gun also at the great London Gun Trial, 1875, beating 102 guns by all the best makers of Great Britain and Ireland. THE PATENT TREBLE WEDGE FAST BREECH-LOADER is the strongest and most durable ever invented, and the most successful gun of the period. Patented in the United States, Oct. 5, 1875; No. 165,328. BEWARE OF INFRINGEMENTS OR IMITATIONS.

W. W. GREENER, St. Mary's Works, Birmingham, England.

**THE SCIENCE OF LIFE, OR, SELF-PRESER-
VATION.**—Two hundredth edition, revised and
enlarged, just published. It is a standard medical
work, the best in the English language, written by a
physician of great experience, to whom was awarded
a gold and jeweled medal by the National Medical
Association. It contains beautiful and very valuable
prescriptions for all forms of prevailing diseases, the
result of many years of extensive and successful
practice. 300 pages, bound in French cloth; price only
\$1, sent by mail. The London Lancet says: "No per-
son should be without this valuable book. The author
is a noble benefactor." An illustrated sample sent
upon receipt of 6 cents for postage. Address Dr.
W. H. Parker, 4 Bulfinch street, Boston. The author
may be consulted on all diseases requiring skill and
experience.

"THE OOLOGIST,"

A MONTHLY JOURNAL DEVOTED EXCLUS-
IVELY TO BIRDS AND BIRDS' EGGS.

This magazine, the favorite of amateur ornitholo-
gists, is now in its third volume. It is replete with
all that is new or recent in Ornithology and Oology,
and publishes important papers on the rarer of our
birds and eggs. It is just the periodical for those
making collections of birds and eggs for scientific
examination, as its columns are constantly furnish-
ing descriptions of the eggs of new and rare species.

TERMS—Forty cents a year, in advance. Spec-
imen copies and prospectuses only on receipt of
stamp. Address,

"THE FISHING LINE."

Brook Trout, Grayling and Black Bass Fisheries
of Northern Michigan,

VIA THE

Grand Rapids & Indiana RR

(Mackinaw, Grand Rapids & Cincinnati Short Line.)

Sportsmen who have cast a fly, or trolled a spoon
in the

Grand Traverse Region

will come again without solicitation. All other lovers
of the Rod are invited to try these waters, wherein
the fish named above, as also Muscalonge, Pike and
Pickerel abound.

In no other streams east of the Rocky Mountains
is the famous AMERICAN GRAYLING found in
such numbers.

BROOK TROUT Season opens May 1.

GRAYLING Season opens June 1.

The Sportsman can readily send hopholes of his
skill to his friends or "Club" at home, as ice for
packing fish can be had at many points.

TAKE YOUR FAMILY WITH YOU. The scenery
of the North Woods and Lake is very beautiful.

The air is pure, dry and bracing. The climate is
peculiarly beneficial to those suffering with

Hay Fever and Asthma.

The Hotel accommodations are good, far surpass-
ing the average in countries new enough to afford
the guest of fishing.

On and after June 1 Round Trip Excursion Tickets
sold to Point in Grand Traverse Region, and attrac-
tive train facilities offered to tourists and sportsmen;
also Mackinaw and Lake Superior Excursion Tickets.

Dogs, Guns and Fishing Tackle Carried Free, at
owner's risk.

Camp Cars for fishing parties and families at low
rates.

It is our aim to make sportsmen feel "at home"
on this route. For Tourist's Guide, containing full
information as to Hotels, Boats, Guides, etc., and
accurate maps of the fishing grounds, send to

SCHUETZENFEST

The FOREST AND STREAM and ROD AND GUN having given a gold medal for team shooting at the

SCHUETZENFEST

of the Sharpshooters' Union of the United States of North America, the Executive Committee of this Union takes pleasure in informing their American friends that they will make all arrangements for team shooting for this medal. The match will take place at the Schuetzen Park, Union Hill, on

Monday, June 24, 1878,

at 11 A. M. Each team to consist of eight men. Entrance fee, \$15 per team. The team making the highest score to win the Fore and Stream and Rod and Gun Medal. The entrance fee may be paid by deducting cost of markers, will be divided among the teams, pro rata. All the members of such teams must be of the same society, and must have been members of it for ninety days previous. The entrance fee is to be paid on or before June 10, 1878, to Mr. F. HARENBERG, Treasurer of the Sharpshooters' Union, No. 190 Greenwich street, N. Y. Any rifle club or shooting society of the United States will have the privilege of sending their teams without being members of the Union. Any communication directed to the secretary will be promptly replied to. GEO. AERY, President, J. H. BEHRENS, Cor. Sec., 31 Bowery, New York.

Fisher's Muzzle-Loading Long-Range Match Rifle.

Interchangeable Grip and Heel Verner Sights, and Wind-Gauge Front Sight, with Spirit Level. Fine English Walnut Pistol-Grip Stock.

This Rifle requires no patent muzzle to load it. Use the same bullet as the Sharps and Remington rifles. Loads the same as breech-loaders, where they do their best work, viz., from the muzzle. As Perry's Score-book says: "No shells to cart a round and pay for. Can be used at one-half the expense of the breech-loader. With powder and balls always ready for a day's sport." Every rifle guaranteed. Breech-loading rifles at manufacturers' prices. All long-range rifles sighted and tested at Creedmoor without extra charge. Agent for P. WEBLEY & SON'S BREECH-LOADING SHOT-GUNS. Send for Circulars. H. FISHER'S Illustrated Catalogue and Score-book for Rifle Practice, price 25 cents.

HOMER FISHER, 260 Broadway, Cor. Warren St., New York.

Bogardus' Patent Rough Glass Balls and Glass Ball Traps.

These Traps are the only ones that give satisfaction, as they are simple of construction, easily set, and not liable to get out of order, and they throw the ball in a manner that more closely resembles the flight of a bird than any other trap in the market. The Patent Rough Glass Balls are made of uniform weight and thickness, and have a corrugated surface that strengthens the ball for shipment to any part of the country, prevents the glancing of shot, and thereby insures the breaking of the ball when hit. CAPTAIN BOGARDUS was the first to introduce the ROUGH BALL, and at a price far below the smooth ball at that time.

Ball and Trap can be ordered through all Gun Dealers. Liberal discount to the Trade. IMPROVED TRAP (warranted), which will throw a ball in any direction from the shooter at the option of the puller, is now ready for the market. Price \$8. Old style, \$6. Parties buying glass balls will receive, in each barrel containing 300 balls, a score book and rules for glass ball shooting, containing 40 pages.

HEADQUARTERS FOR BALLS, BAGGERTY BROS., 10 Platt Street.

FOR TRAPS, HART & SLOAN, Newark, N. J.

Second and enlarged edition of "Field, Cover and Trap Shooting," by A. H. BOGARDUS, containing instructions for Glass Ball Shooting, and chapter on breeding and breaking of dogs by Miles Johnson. Price \$2, by mail, postage paid. Address, Capt. A. H. BOGARDUS, Elkhart, Logan Co., Ill.

IRA A. PAINE'S

FEATHER FILLED GLASS BALL.

PATENTED OCTOBER 23, 1877.

The "Standard" Ball.

The Bohemian Glass Works would respectfully call the attention of all dealers in Glass Balls to the fact that the Paine Patent Filled Ball is the STANDARD and ONLY BALL MADE TO A SCALE, therefore we would respectfully caution the dealers against laying in a stock of unsaleable articles for the Spring Trade, when you can purchase the Best Ball ever made at prices less than is charged for other inferior balls.

No other ball affords the PLEASURE of the Feather Filled Ball, and no other Ball is as beautifully made. It will break in every instance when hit by shot, and is sufficiently strong to prevent breakage either by transportation or falling on the grass.

Every ball is weighed and examined, then packed with the greatest care, in barrels of 300. Send for price list. Special inducements to the trade.

HEADQUARTERS BOHEMIAN GLASS WORKS, 214 Pearl Street, N. Y.

ESTABLISHED IN 1837.

Consult your interest by sending for our revised and reduced prices.

Excelsior Scroll Saw

LATEST IMPROVEMENT. Double Table, including one foot saws, thirty minute lathe, sawing patterns and prepared wood, in the value of \$4. A new device for tightening saws, Power Drilling attachment, Winch, Oil Cup and Screw Driver. Speed, 800 strokes per minute. Saws, 12 inch thick. Price, complete, case and delivery, on board cars or at Express office, \$22.

Saw only, without attachments, \$9.

SMALL STEAM ENGINES.

With Copper Boiler, to drive light Lathes, Scroll Saws, etc. Are all sizes from 1/2 up to a horse power, either plain castings, partly finished, or complete, ready for use.

The "Scientific American" of June 19, 1875, says of the above, in an extended editorial, introducing our manufactures to the public: "It can turn winches, pumps, washing machines, or ice cream freezers, run coffee mills, pump water through a house, operate foot lathes, scroll saws or light boring machines, run knitting or sewing machines, turn a grindstone or emery wheel, work ventilating or hand thrashing machine cut-

ters, meat or feed choppers, in sausage machines, drive small blowers for pneumatic dispatch tubes in a building, or for a blacksmith's forge, or compress air or work an air pump on a small scale in a laboratory. These are a few only of the purposes to which it can be applied."

Also Engines and Boilers capable of propelling 15 to 25 tons. The boats have keel, stem, with rudder and tiller, tow hooks and coir.

Those wishing a pleasure boat will find

Buffalo Pony Planer

NEARLY ONE THOUSAND IN USE. Buffalo Pony Planer. Will cut its self and pay expense of running in 8 days. Price from \$50 and upwards, each.

LIGHT MACHINES FOR PONY OR HORSE POWER.

The great success of these machines is unprecedented, and it may be confidently affirmed that no article has ever more clearly proved its superiority for the quantity and quality of its work than this. It is made in several sizes, and can be fitted up

suitable for bullock, mule, steam or wind power, in addition to those above mentioned.

Patented March 30, 1875.

Best of its kind in use. Price, complete, \$275.

Also Planing Machine

Knives, which we recommend as superior and extra in quality.

Buffalo Excelsior Pony Planer and Matcher.

Best of its kind in use. Price, complete, \$275.

FOREST AND STREAM

ROD AND GUN

THE AMERICAN SPORTSMAN'S JOURNAL.

Terms, Four Dollars a Year.
Ten Cents a Copy.

NEW YORK, THURSDAY, APRIL 11, 1878.

Volume 10.—No. 10.
No. 111 Fulton St., N. Y.

PIGEONS.

Selected.

PINK-FOOTED, sleekly white, or delicate fawn,
Or darker plumed, with glossy throat where clings
One soft perpetual ripple of rainbow tints,
How often to your beauty our sight is drawn
When back from roanings while you suddenly dawn,
A love's turbulence of quick-duttered wings,
Alighting on some brown slanted roof like spring's
Pale showers of blossoms on an orchard lawn!

Our common barn-yard life, plain, stolid, rude,
You haunt with tender purity sweet to note;
And gladden its dullness with your buoyant throng,
In many a smooth and mellow interlude
Through homelier sound serenely letting float
Your strange luxurious monotonies of song!

—Edgar Faicett in *Atlantic Monthly*.

For Forest and Stream and Rod and Gun.

On Bay Chaleur.

THE NOUVELLE AND ESCUMINAC.

ANGLING is my profession. In its pursuit I have spent the happiest hours of my life, and though I have seen more than fifty summers, yet when the leaves begin to come forth, and the warm spring rains are falling, that same old fever throbs in my veins, and I experience an irresistible longing to hear once more the music of running water, to inhale the aroma of the forest, and to feel the thrill which none but a born angler can experience. And so I found myself last summer impatiently waiting for the balcyon season to arrive. Determined to find some locality, no matter how far away, that was not yet fished out, I concluded to visit streams in the Province of New Brunswick, and one morning in July I found myself with a companion in the pleasant village of Dalhousie, on the south shore of the Bay of Chaleur. Opposite to this village, in the Province of Quebec, are two small rivers called the Nouvelle and Escuminac, which empty into the bay at points about six miles apart. By the kindness of two gentlemen, residents of Dalhousie, we procured the necessary outfit, including letters to the wardens of the streams, and one pleasant afternoon, after having received the kindest attentions from Messrs. Montgomery and Phillips, we set sail in a hirsch bark canoe for our objective point—the mouth of the "Skimiac." Tom, our guide, rigged an old blanket in his light craft, which supplemented his efforts with the paddle, and, under certain conditions, "worked splendidly." We found that the Escuminac was leased to the proprietor of the hotel at Matapedia, but that by paying a small fee we could obtain privilege to fish. Dan Brown, the warden, at whose house we stayed, was one of the best hearted, most accommodating men I ever met. Indeed I may here add that we received courteous treatment from every person with whom we came in contact while in this portion of Canada. We spent the remainder of the week skirmishing around, hunting with but indifferent success. We made a trip to the Nouvelle. This is a beautiful river, well stocked with fine trout. I can imagine no trout stream more attractive. Fishing is free to all. To fish it to the best advantage requires a birch bark canoe and two men. These, and ordinary supplies, can be procured at Dalhousie. A tent and camp utensils are also needed, for though the valley is in some parts quite thickly settled, yet I heard of no one prepared to accommodate sportsmen.

The trout begin to ascend the stream about the first of July. The fishing is best from about the middle of July until the latter part of August. The flies most successfully used are nearly, if not quite, as large as salmon flies. There never have been any salmon caught in either the Nouvelle or Escuminac.

On the following Monday we packed our baggage into a one horse wagon, drove to the end of the road, and in the afternoon pitched our tent on the banks of the Escuminac, four miles beyond the last clearing. Tom, our half-breed guide, is strong, patient and willing. He has hunted and trapped all through these forests, and knows every foot of the territory. Dan Brown accompanied us, determined, as he said, to show us that there are trout, and big ones too, in the "Skimiac."

Toward evening I proposed to my companion that we try to catch some trout for supper. He declined to fish, but took his landing-net and accompanied me. A few rods above our tent we came to a long, deep pool. At the second or third cast I hooked a fish, and after a short and not very exciting struggle the meshes of the net inclosed a beauty. Again I dropped my fly over a ripple on the further side of the pool. It was instantly taken, and the sport began. My game had made a dash for a bit of fly for his supper. I was now intent upon securing him for our supper. 'Twas a long, clear pool, and I gave him a fair chance. And right gallantly did he

struggle. But each desperate rush was less vigorous than the preceding, and at last he too lay quivering in the net. The midgits were biting fiercely, and we returned to camp with two trout weighing 2½ and 3½ pounds. Enough surely for our supper, and a rather encouraging commencement. The next day Dan and I started to explore the North Branch. A few hundred feet from its mouth we discovered several large trout. But though we ascended it about three miles we found no others. I was never so much nonplussed and disappointed. It seemed to be the most natural trout stream I ever saw. But they were not there. Late in the afternoon we again reached the main stream. Here we found a beautiful pool. Within half an hour, by the aid of Dan and his landing-net, I captured three trout weighing together 6½ pounds. Myriads of midgits were attacking Dan's unprotected face, neck and arms, and so, feeling that the day's fishing had not been an entire failure, we returned to camp. My companion and Tom were absent, but within an hour returned. Tom carried a string of nine trout weighing 25½ pounds. My string of three, of which I had previously felt a little proud, was nowhere, and I couldn't help wishing that I had staid upon the main stream. The next morning early we three started on our tramp up the river. We waded nearly all the way. The forest was almost impassable, and the underbrush grew close to the water's edge. The water in many places was knee deep, and every foot of the river bed was thickly strewn with large stones or the sharp edges of a kind of slate rock which seemed to dip at right angles with the surface. The current was swift, and our progress slow. It was one long, and I began to think, endless rapid. The water was so perfectly clear that every part of the bottom could plainly be seen, and no fish could have escaped the keen eyes of Dan, but not a trout was discovered. It was a wearisome tramp.

At last we reached a pool. Dan, who was several hundred feet in advance, stood gazing into the water, and signaling us to approach cautiously. We did so, and looking where he directed us, saw plainly a portion of the bottom literally covered with large trout. It was a long, deep pool and about fifty feet wide. The opposite bank was high and thickly covered with underbrush to the water's edge. On the side where we stood there was a stony beach about eight feet in width, back of which was a dense growth of cedar and spruce. A current of swift running water extended to the middle of the pool, and seemed to shield us partially from the sight of the trout. Mr. B. advanced to the head of the pool and cast directly over the "school." There was a sudden swirl in the water; the next instant the click of his reel and the bend of his beautiful grise rod indicated that he had exciting and very agreeable business on hand. I took position about thirty feet below him. At the third cast my fly dropped at the right spot, and I too hooked one, which I led toward the lower part of the pool, where I had plenty of room to play my fish without disturbing the others.

"Gentlemen," said Dan, "there is a barrelful of big trout in that pool. It's plain now that they'll rise to a fly. Just play your fish until I go below there and pile up a wall of stones across the mouth of that little bay, and then you will have a crib where you can keep your trout alive until you git done fishing. To my certain knowledge there has never been a fly cast in that pool; and if you don't do some tall fishin' it will be your own fault."

I am unable to fully describe my feelings while standing on the shore of that beautiful pool, carefully handling a 3½ pound fish, while Dan was building his crib. For more than thirty years I had dreamed, by day and by night, of some such spot. Before me, in plain sight, lay the beautiful fish, whose retreat, far away in the forest, no angler had hitherto invaded. They were evidently hungry, and sprang fiercely at the tempting fly. And noble game they were, averaging more than three pounds in weight. They could only be lured by the aid of the net, which, in the skillful hands of Dan, seldom missed. Being in search of sport and not specially desirous to count, I gave every one of the beauties that I hooked a fair chance. My light but tough rod was a delight to the eye, as it gracefully bent and sprang back again, ever keeping a taut, but not too stiff, hold upon the fish. Talk of Thomas' orchestra, or the most gifted singer's voice! I'll leave it to any real lover of angling whether the hum of the reel as some noble fish runs out 75, 100—more—feet of line isn't the most exhilarating music he ever heard!

At last the sport began to wane and we surveyed our catch. In that crib lay forty as gracefully formed and as beautifully marked trout as I ever saw. They were all alive and apparently uninjured. We had left our scales at the tent, and were unable to tell the exact weight, but they undoubtedly averaged more than three pounds. To determine as near as possible, and to settle a difference of opinion, we took out and killed the two smallest and eleven of the largest. We then turned the others back into the stream. It was a rare excitement and pleasure to me to catch my share of these beautiful fish. It was an almost equal satisfaction to be able to return to their native waters, absolutely uninjured, such as we were unable to rise, and thus waste no game.

Upon returning to our tent we found that our two smallest fish weighed 2½ pounds each and the others from 3½ to 4½. That evening Dan, having, as he said, fulfilled his promise to show us all the trout we wanted, returned home, taking to our kind friends in Dalhousie a present of trout, which were pronounced as large and as fine as either had ever seen.

The next evening, at about 6 o'clock, my friend not caring to fish, I took Tom with me, and after a tramp of thirty-five

minutes, reached the pool from which Mr. B. had caught his string of nine. On the side opposite to me lay a submerged cedar log, and close to it a "school" of trout. The water ran swiftly past this log and settled in a deep pool below. The instant my fly dropped near the log it was gamely taken and carried with a rush away down into the pool, until about 100 feet of line had run out. After an exhibition of more vigor than had been displayed by any I had yet handled, a three-pounder lay gasping at our feet. Another, still more lively, weighing 3½, afforded lively sport, and was subdued only after a long struggle.

The evening was cloudy, and as it was becoming dark under the shadow of a hill to the west of us, I added a nearly white fly. Casting within a foot of the old cedar, I was astonished at the commotion in the water and the unusual strain upon the rod that instantly followed. "You've got two!" cried Tom, now almost as much excited as myself; "you'll lose 'em, sure." But I didn't. Fortunately they ran into the deep water and engaged in an unceasing series of ground and lofty tumbling very exhaustive even to a trout; and, sooner than I had expected, they were lying upon their sides in the water at our feet, and were secured. They weighed 5½ pounds. Not wishing to engage in a struggle with two, at the great risk of losing both, I took off the flies I had used and put on one of a dozen tied for us by a gentleman, a most skillful angler, named Beard, residing at Campbelltown on the Restigouche. At the second cast I hooked a trout, the capture of which rewarded me for all the time, money and fatigue expended on the trip. I shall ever feel under certain personal obligations to that trout. I have always been interested in "fish stories." Every detailed account of exciting struggles with game fish, whether printed or oral, has absorbed my attention. I had up to this time, under the most favorable circumstances for real sport, caught some large trout, yet their "play" had not quite equalled the glowing stories I had read and heard; and the unwelcome suspicion had obtruded itself, that the narrators had drawn largely upon their imaginations, but that trout redeemed the reputation of its species and restored my confidence in the veracity of anglers.

A full description of all his performances during that fifteen minutes' unceasing struggle, would be a *resumé* of all I had previously read or heard told. He was 23 inches long and weighed 4½ pounds. From the same "school," and as rapidly as I could handle them, I caught four more nearly as large; but, as we could not use them, and I never willingly wasted game, I turned them back. The shades of night were closing round us. I put up my tackle and made a regretful adieu to a spot where, for about two hours, I had realized the aspirations of almost a lifetime. A few days more of this glorious sport was vouchsafed to us, and then we bade good-bye to Dan and his estimable wife, who had striven in every possible way to make our stay comfortable and pleasant, and then returned to Dalhousie.

The Bay of Chaleur is here about six miles wide. The land on the north shore rises into irregular steep hills and mountains. There is a line of farms close to the shore, but the interior is a wilderness. On the south shore the land is less broken, and is occupied by apparently thrifty farmers, who make the most they can of the short summer. As we sailed into the middle of the bay and looked back upon the hills and mountains, rising one above another far toward the north and northwest, and then upon the quiet beauty of the south shore, no sound disturbing the Sabbath-like stillness but the cry of the loon, the clear bracing air of this far northern latitude sensibly reinvigorating us as well as speeding us on our way, I thought that though I had often sailed upon a pleasant lake, yet nothing in my previous experience had been quite so enjoyable as that evening's trip across the Bay of Chaleur.

THE LAKE REGION OF FLORIDA.

MELROSE, Fla., March 25, 1878.

EDITOR FOREST AND STREAM:

We left here Tuesday evening for Wall's place on Lake Pleasant for a two-days' deer hunt. As it is getting near the time when the law is on, we thought we would try our hand at this noble game. We arrived at Wall's—about six miles from here—in good condition, after having a rather noisy, but not unmusical, reception by his pack of hounds. After a good night's sleep and a solid breakfast we started for the pine woods, a party of four, Wall, Paggett, an old deer hunter on his horse, Steve and myself, with a pack of hounds, one of them—Paggett's—being a perfect beauty. Such a fine head and nose! such intelligent eyes! And to hear her when at work in the distance, what finer music could one wish for, especially the deer hunter? After a pleasant walk of about four miles through the woods, the country being gently rolling, with no swamps or underbrush, we arrive at our stands (Wall, Steve and I), while Paggett circles out on the drive. We place ourselves about 200 yards apart, sit down and wait. At first I keep a sharp look out in the direction in which the dogs have gone, and from which direction I expect to see the game appear, only occasionally turning my head to take a backward glance. Thus I sit for what seems a long

time, thinking only of deer; but, as nothing is heard from the dogs, and nothing seen but the squirrels, my mind gradually wanders off, and I am thinking of home and of the friends I have left there.

How still it is! Nothing is heard but the sighing of the wind through the pine tops—a lonesome sound. I also try to imagine how it will look here—the circle I can sweep with my eyes—in the future. How it will be improved, and what now is only a forest, will be homes, cultivated fields, orange groves, and yonder beautiful lake will be dotted with sails. And what a place for a scull race on this same lake! Plenty of water, no obstructions, no need for fowls; and with the telegraph we can tell you which of the famous crews have won; or, which would be better, you could get on a palace car and come and see it yourself. This beautiful and healthful climate, the adaptability of the soil for fruits and vegetables, with its splendid lakes (all filled with fish), will make this region the Italy of America. It is only a question of time, and I am thinking that time will come sooner than most people are aware of now. Already civilization is rapidly approaching, and the deer and other game will have to keep on their ever onward march before its approach. It seems a pity almost that they cannot have this portion of their native land left to them.

But, while my sympathies are being aroused for the persecuted, I hear a gentle pat pat, and quickly turn my head, when behold! two fine does have stolen softly up behind me and are quivering off on a slow lope. I have heard no dogs, so the sight is quite unexpected. My reveries are dispelled like a flash; my sympathies are forgotten, and I rise up, take careful aim, as I suppose, fire, and—I have missed my first deer! But I knew it not then, for when I fired she fell upon her knees. I let drive at the other as she wheeled. As I fired my second shot the first deer had regained her feet, and both rushed off like bullets in the direction of Wall's stand. In a moment I heard him fire, then all was still again. He soon came in and reported. He had had a long shot, and thought both went off unhurt, but said he would follow them up and look for blood signs. As he and Steve left I sat down to ruminate over that shot of mine. Why had I not killed my deer? I took careful aim; it was within close shooting distance; I was not excited; did not have the huck ague, for they came upon me too suddenly for that. It was one of those "unaccountables." Perhaps my sympathies had something to do about it—who knows? The others soon came in and reported no signs of the game being hurt. Probably the deer partly falling was caused by its wheeling so suddenly.

By this time, hearing Paggett's horn, we start for the lake, where we are to meet him and take our lunch. On seeing him I tell him about my shots. He answers by saying when he heard the guns he "allowed we had shot a deer," although his dogs had failed to jump any. He saw plenty of signs, but said the cow hunters were out looking for their stock and had driven the deer off into the swamps, but "allowed" he would jump some after dinner. In the afternoon he started a drove of five, but they went off in an opposite direction, and I did not get another shot during the day.

We camped by the lake during the night, Paggett going home, intending to make an early drive in the morning. The day being rainy, he fails to make his appearance, and we, after getting a string of squirrels, start for Wall's, where we arrive toward sundown, tired, but I, for one, well pleased with my trip, notwithstanding the poor shot. Next fall I hope to try it again, also the turkeys, there being plenty of both deer and turkey a few miles farther on from where we camped. We intend to take our "fixings" along and camp out a week or more. There are also bear and panther in the swamps, which we shall have a chance to see, and at which I hope to take a better aim than I did at my first deer.

I noticed two very large flocks of brant flying over the lake (Santa Fe) this morning, on their way North. We are having warm weather, everything growing finely. Orange and peach have been in full bloom for some time. They both give promise of a large yield. Yours, C. O. GLADWIN.

DUCKING AT ENGLISH LAKE.

LANCASTER, O., March 25, 1878.

I have been on a most enjoyable as well as successful duck hunt at English Lake, Northern Indiana, one of the finest feeding grounds for water-fowl to be found within the borders of the United States. There are vast fields of wild rice in and about this lake, and I was assured by my "pusher"—boatman—that it could be gathered in large quantities in the proper season. If George Green, proprietor of the Sportsmen's Hotel at English Lake Station, was applied to, I have no doubt that he would attend to the harvesting of a crop. Wild celery, too, abounds here in sparse patches along some of the sluices and bayous, but not in sufficient quantities to attract the canvas-back very numerously.

English Lake at this time of the year is an almost interminable stretch of watery wilderness, the whole country being so swallowed up by the extending swamps and marshes as to be utterly indistinguishable from the lake proper. The Kankakee River, dim artery to the core of that whole wild region's heart, cannot be told, even by one familiar with the general configuration of the landscape, from the hundreds of sluices, divides, channels, bayous, and cut-offs, which bewilder one on all sides. These waters cover, in a great measure, a heavily wooded country with an exuberant growth of pucker-bush and swamp-willow to fill up the interstices, while extensive fields of wild rice and cane are to be met with at very frequent intervals; and these towering fastnesses, with the interspersing woods and lonely shades of morass and lagoon, afford an almost undisturbed home for the wild goose and duck, the brant, sand-hill and fish-hawk. That it is a fine point for duck shooting, I will observe, parenthetically, that Dr. G. W. Boerstler and myself bagged ninety-three in two days' shooting, and that, too, during the extreme summerish weather of a week ago, which was diametrically opposed to success. Our bag was composed principally of blue-bills, with a fair showing of mallards and whistle-wings, and a single canvas-back, downed by the Doctor from a flock of six, all we saw that came near settling among our decoys. By the way, a blue-bill is no slouch of a duck, but a splendid, plump little fellow, somewhat larger than a blue-wing teal, and every whit as much of a *moreau*, and far the mallard's superior.

Our sportsmen here are all much puzzled at the non-appearance of sape, as the weather, with the exception of yesterday's sudden change, for the past fortnight, has been highly snipe-like. On Saturday I took a prospecting tramp through the low, marshy prairie land west of the city, but failed to "jump" a single bird. I did "put up," however, a veritable flock of owls, who had been basking in the sun among the "nigger heads" in the open prairie, and without a moment's

thought, and spurred on, I suppose, by the aggravating absence of the snipe, I tumbled two into the dead grass, as they fauned heavily away. Upon examination I discovered that they belonged to species of the genus owl, with which I am unacquainted, being neither screech, barn or horned owls, but about half the size of the latter, with an enormous stretch of wing, and a smaller head, devoid of the horn-like tufts of our big booter. What were they?

About all of our summer birds, with the exception of the martin and swallow, the oriole and catbird, are here. The robin, sparrow, woodpecker, yellow-hammer, blackbird, in all colors, yellow and bluebird, the dove, night-hawk, meadow-lark and peewee, are all back; in fact, have been here for weeks, many of them all winter. The martin and swallow invariably come within a day or two either way of the 1st of April.

Yesterday we had a break in our "bland and childlike weather" of the rigid description, accompanied with a fine flurry of snow; but it is hoped that our glorious fruit and wheat prospects will come out safe. The cold has brought the ducks about as if by magic, and a party left this morning for the Big Reservoir crazy for a little shooting. Our rifle and sporting club has not as yet been put upon a permanent foundation, but a lively interest has been aroused, and if you will only be so kind as to send us the form for such an organization we'll all be happy. S. G. V. G.

Fish Culture.

FISH BREEDING IN CANADA.—The importance of this subject has attracted no little attention during late years, and great efforts have been made to increase the stock in Canadian waters. The present headquarters at Newcastle, Ont., are under the special charge and superintendence of Mr. Wilnot, whose knowledge of such matters is well known. Besides the above, there are at present in the Dominion six fish-breeding establishments, located as follows: Bedford, N. S.; Restigouche River, N. B.; Miramichi River, N. B.; Gaspe, Que.; Tadoussac, Que., and the Whitefish breeding establishment of Sandwich, on the Detroit River. We learn that it is the intention this spring to stock the rivers back of Ottawa with 3,000 whitefish and 1,500 speckled trout. The fry are in Col. Denis' aquarium pending favorable weather. To give some idea of the extent to which fish culture is carried in Canada we might state that no less than 150,000,000 of these fish have been turned into the open waters of this country, a great proportion of which are to be found in Lake Erie. Last fall 30,000,000 eggs were successfully laid down, and with the improved facilities, it is anticipated that from six to one hundred millions of eggs will be laid down next autumn. It is found that 60,000,000 can be produced at the same cost as 7,000,000.

Considerable headway is being made in salmon culture. There are 7,000,000 ova now in process of hatching which will be distributed at various points in due time. Also 1,000,000 salmon trout, the ova of which has been obtained from Lake Huron. There are now being hatched 10,000 *Salmo fontinalis*, or speckled trout, and what is only found in the lakes of Cumberland and Westmoreland (England), the *Salmo simla* or Char, one of the most delicious eating fish that swims.

Montreal, April 2, 1878.

MR. WHITCHER TO MR. BLACKFORD.—The Fish Commissioner of Canada writes thus pleasantly to Mr. E. G. Blackford:

MY DEAR MR. BLACKFORD:

I am much obliged to you for interesting printed circulars respecting exhibitions of choice varieties of fishes. These displays would be profitable as well as entertaining to me, if for another reason than that I know you to be so practical and skilful a man of fishes, that none but the best of each class would be represented in your collection. It was my intention, and I looked forward to it with great pleasure, to attend meetings of the Fish Cultural Association at New York last winter. Unfortunately, however, pressing public business rendered it impossible for me to realize such pleasurable expectation, and the same pressure still prevents my visiting your establishment this spring. Probably our friend Hallock will notice it, and as I take FOREST AND STREAM, will look out for it. That paper I consider the best authority on fishing and fish culture published in the United States.

Yours truly,

W. F. WHITCHER.

—The California brook trout at Caledonia began to spawn, and a large number of eggs are expected March 14. Seth Green has crossed them with the native brook trout, expecting an improvement on both parents.

—Seth Green has done a good work by planting 100 black bass in Wappingles Creek last week. They were fine breeders, averaging a pound and a quarter apiece.

—Six cans of black bass, one hundred in number, each weighing from one to two pounds, were taken to Middletown on March 2 and placed in Monahan Lake. Seth Green's agent accompanied them from the State fishery at Rochester. A number of brook trout will be brought soon and placed in the different streams in Second Assembly District.

MICHIGAN.—Loon Lake, Assyria, has been stocked with 3,000 lake trout. Aldrich Lake, White Pigeon, has been stocked with 5,000,000 whitefish, and Klinger Lake with 50,000 of the same.

WISCONSIN.—Tomah, April 8.—Hon. William Y. Baker, member of assembly, in connection with the Buckhorn Sporting Club, have just planted 15,000 small fry of speckled trout in the head waters of Bear Creek. The little fellows were received from the State commission in good condition, and successfully placed in the stream on Monday night, April 1.

SOUND.

CARP AT SAN FRANCISCO.—It is probable that in a few years the small streams around the Bay will be well stocked with carp. Those which escaped from Poppe's ponds, in Sonoma Valley, a couple of years ago, have increased considerably, and it is now no uncommon occurrence for the boys to catch them along Petaluma Creek with a hook. Several were taken in out of the wet last week, and parties who know the fish say they are genuine carp. One of them weighed between one and two pounds.—*Pacific Life*.

Natural History.

BIRD NOTES FROM LONG ISLAND.

BY FRANKLIN BENNER.

THE following remarks are founded on notes and observations made during the early part of the past year and give some idea of the birds that are nesting as near the city of New York as Astoria, L. I. A few days only could be obtained for extended investigation, and these amply repaid for the time expended. The birds noted were nearly all found within a mile of the ferry that crosses from 92d street.

This proximity to the city is having a most destructive effect on the fauna, and the woods in the fall are overrun with pseudo-sportsmen, followed by worthless curs, who shoot anything and everything that has the least apology for feathers or the remotest appearance to game. Robins, sparrows, warblers, all fall under this category and are ruthlessly destroyed. There are still a few rabbits, gray squirrels, and occasionally a woodcock to be found there, but the day of their complete extermination is near at hand. The local destruction of all the small birds and songsters is getting to be intolerable, not only in Astoria, but in all the suburbs of the city, especially on Staten Island, and it does seem as if there should be some action taken by the local authorities to prevent it.

The observations recorded commenced on the 8th of May when a song sparrow (*Melospiza melodia*) was found snugly ensconced in an ivy growing along the inner wall of a greenhouse. The birds had evidently watched their opportunity when the door was open or the glass raised during the warm days, and constructed their nest and deposited three eggs before they were discovered. In 1875 they built a nest in the same place, and the year before on the ground against the wall just outside. A pair has been around there for a great while; a nest being found within a hundred feet of the spot for some six or seven years. Whether they are the same pair of birds I am unable to state, but it is to be presumed so. The next day another egg was laid and incubation commenced. On the 22d four hungry mouths greeted me when I looked into the nest, but alas for the future happiness of the parents, a cat, during her investigations two days after, found them, and a deserted home was the result.

May 15.—Noticed the appearance of the chestnut-sided warbler (*Dendroica pensylvanica*), yellow warbler (*Dendroica aestiva*) and Baltimore oriole (*Icterus baltimore*). The catbird (*Mimus carolinensis*) put in its appearance the next day. On the 20th, while sitting on the front piazza of the house, I noticed two wood thrushes (*Turdus mustelinus*) under a copper leaved holly not twenty feet off, tugging at an old piece of newspaper. The paper was too large for them, and they were not inclined to use anything else just then for the nest, which they had decided to construct, and whose location had been already fixed upon as will be seen. In a few moments they were off, and hastily running down, I tore the paper into strips and went back to watch results. In a short time they returned and eagerly seized the strips, which had by some force unknown to them become suitable to their wants, and flying up in the tree they placed them in a fork about ten feet from the ground. I then furnished them with pieces of cedar bark, soft hay and some pieces of cotton, scattering it under the tree, and from that moment the building went on at a lively rate all day long without intermission. The cotton they declined to use, as unsuitable for their purpose, but it was appropriated by a pair of Orioles that were building in a neighboring willow tree and had already a nest half finished. Two pairs of chipping sparrows (*Spizella socialis*) were also noticed in the garden as having their nests under way.

The thrushes' nest progressed favorably, and in due time the eggs were laid and hatched, and the young left it on the 20th of June, just one month from its commencement. The parents on June 30th started another in a maple tree near by and brought it to a like successful issue. These thrushes are abundant, both around houses and in the deep recesses of the woods, where they usually keep themselves in other localities, some four nests being found in such places. Near houses they are very sociable, a pair building one year in a tree so near the house that I could touch it with a cane from the piazza before mentioned. There is a limb of a flowering crab apple on which they seem to delight to perch, and all through the spring and early summer at evening there is one of these birds upon it, pouring out its rich notes to the world at large. They have used this perch for years, and they all seem to know it. Perhaps there is an inspiration in the view from it which brings pleasant thoughts to them of incidents in their bird life that made them happy. On several occasions I have heard a note or two from them as late in the evening as ten o'clock, but this is only on rare occasions.

The 30th of May was a bright, warm, sunny day, just such an one to be enjoyed by a tramp through the country, and I took advantage of it and started out at nine o'clock for the woods a short distance from the house and extended my tour for two miles beyond during the day. In going along a small stream I soon noticed the yellow warblers, and Maryland yellow-throat (*Geothlypis trichas*) dodging in and out among the alder bushes and blackberry briars that covered both sides. Soon I found a nest of the former in an alder bush, containing four fresh eggs; a little farther on, another, containing four fresh eggs and one of the cow bunting. There were probably many more in the neighborhood if the trouble had been taken to find them. A song sparrow's nest was discovered on the ground quite near these, with four fresh eggs. After searching for some time for the yellow throats I was at last rewarded. As I was passing through some black alders one started out almost under my feet, and, on looking down, I saw the nest placed in some weeds and raised some six inches from the ground. The cow buntings had been on a visit here also, but had not let it off so easily as the warblers; three of their eggs were in the nest, and only one of its rightful owner. Thinking the bird might still lay its full complement, I left it, but on my return, a few days after, I found incubation had commenced without further addition to the number of eggs. Could this bird count and thus know that she would have all the mouths she could possibly fill, and that four was her just number? If her reason had extended a little further, she might have deserted this set entirely, for the fate of her own was sealed when the strangers were placed under her unwilling care. A few days after I found another nest of the same species, and this, in addition to the full set of the bird's own eggs, contained likewise one of the hunting. I judge that birds, where the bunting eggs have been placed in their nests, before they have commenced laying, will never lay full sets, and where full sets are found with the addition of the bunting, the latter has been placed there after

he laying was completed. This fact, I think, will be borne out by observation. In the woods the golden crowned thrushes (*Sturus auricapillus*) were abundant, and their clear ringing notes were heard all around, but their nests could not be found.

In a small thicket, not more than fifty feet in diameter, I watched a least fly-catcher (*Empidonax minimus*) building, and within twenty feet of it found two nests of the cat bird and one of the song thrush. There were also a pair of those independent little birds, the white-eyed vireos (*Vireo noveboracensis*) perching about and searching for their food, and every once in a while stopping to give forth their emphatic notes and continuing their investigations as before. I am positively sure they were building, if they had not already finished a nest, but was unable to discover it. These birds are common here, and nearly every thicket contains a pair, in order, perhaps, to enliven the otherwise silent habits of its denizens. Three days after this a nest was found suspended from a limb about three feet from the ground. The female was occupying it, and watched me very sharply with her sparkling white eyes as I approached, and did not leave it until I nearly covered it with my hand, when she started up, and calling to her mate, they both exhibited the utmost concern for their treasures, which consisted of four newly laid eggs, together with one of the ever-present bunting. The nest was a beauty—one of the most perfect of its kind I ever saw. It was composed of moss and bark, and decorated outside with pieces of decayed wood and spiders' webs. I had one in my collection, which was entirely covered with bits of white decayed wood and green moss. It was an exquisite structure. The use of the wood I have never noticed except in these two nests. A red start (*Setophaga ruticilla*) was also noticed before leaving the clump of bushes above mentioned.

Passing through an orchard, I heard the voluble chatter of a wren, and on investigation found the nest in a deserted hole of some woodpecker. It contained six eggs. These birds are common, both around the houses and in the orchards; but they will have to look well to their homes in the latter place, for the sparrow (*Passer domesticus*) is rapidly taking up his residence there also. Within two hundred feet I found one of their nests, with five eggs, in a hole in an apple tree, and during the season two others in like situations, one with eggs and one with only one young bird. The sparrows are abundant and make themselves at home around the houses and barns, associating familiarly with the chickens when feeding time comes round, to pick up the wheat which is thrown to them. In regard to their contests with the other birds, I have had several incidents come under my notice during the last two years. Just in front of my window is the stem of a dead spruce tree, with the limbs trimmed up, and on the top is placed a house with two compartments, and a shelf running around each side, the possession of which is welcome to any tenants who are able to hold their own. Year before last a pair of sparrows took up one side of it, and a few days later I heard a pair of wrens around, who seemed inclined to occupy the other half. They soon commenced to build, and now the fun began. The sparrows took it very quietly at first, only looking on while the wrens scolded and chaffed at them, sometimes even coming around to their side to pick a quarrel. One morning I heard a tremendous fuss, and, on looking out, found that the sparrows were going to resent insults, and that in a very curious way. They watched when one of the wrens came up with a few sticks, and when it had gone inside one of the sparrows followed, and turning around, quietly sat down in the doorway. Such a noise as that imprisoned wren made, and its mate outside also objected; but there was no way out of the difficulty. The sparrows would stay in this position a few minutes, and then fly off, only to repeat the performance when the wrens became too aggressive. After a while there was a mutual truce and matters went on more quietly. Last spring the same thing was re-enacted, and with the same results. How it will be next year, and which one will be inclined to yield, I cannot tell; but it is probable that two pairs of sparrows may occupy the house, and then friends wren will find it hard work to dislodge them. It has been recently stated that the sparrows are very prolific, and an instance was given of thirty-five eggs having been taken successively from one nest. This might be very true; but it is no good reason for their rapid increase. Various other birds are known to do the same thing, notably our golden-winged woodpecker, (*Colaptes auratus*), and very many of our common birds will rebuild if the first nest is destroyed. As stated before, in regard to the imposition of the hunting eggs, birds seem to have the faculty of counting, and if the experiment of withdrawing the eggs from the nests of some of our other birds, unseen by them, could be tried, they could undoubtedly be induced to continue laying for some time. The sparrows and the golden-winged woodpeckers are both, in a measure, careless about the location and construction of their nests, and any intrusion is not so palpable to them as to many birds which display so much more taste and skill upon their summer homes.

NOTE.—Since writing the above I have been informed that fish bawks will continue laying in the same manner as the eggs are gradually taken from the nest.

(To be continued.)

LIVING BIRDS WITH TEETH.

EDITOR FOREST AND STREAM:

CHICAGO, 1878.

In your issue of Feb. 21 there appears an interesting and well-written article, entitled, "Birds With Teeth." The description of the fossil birds of the Cretaceous period is accurate and instructive; but I cannot believe it certain that *Hesperornis* was a water bird exclusively, nor that it was a pure carnivorous creature. But whether it was one, or both of these, the doctrine of the Evolutionists, that these birds represented the transition forms between the great reptiles of the Oolitic and the subsequent higher developments, is neither a necessary nor, in my opinion, logical deduction from the great facts of creation.

The birds spoken of had teeth—*bona fide* teeth, without doubt; some of them set in sockets, with a fang at one extremity, and enamel at the other. But, in order to fully understand the import of so remarkable a circumstance, we must take into full view all of the surrounding facts.

A great change had come upon the world during the ages under consideration. Geology tells us that there are indefinite markings of plant life so low down as the Silurian and Cambrian beds, but these represent mere sea weeds, which preceded the rich development of vegetable life during the Devonian—that age rendered famous by Ilugh Miller in his studies of the "Old Red Sandstone."

But up to the beginning of the Cretaceous period, the only known flora consisted of crabs, pines, and various forms of cryptogamic vegetation. At this time, however, a remarkable development takes place. Flowering plants—the dicotyledonous—the higher forms of vegetable and plant life, have made their appearance. Along with this great

change, marking another click in Nature's time-piece, comes, hand in hand, an almost incredible fact, viz.: Many forms of tropical vegetation, as the myrtle, fig-tree, oleander, etc., flourished luxuriantly in that region now known as Greenland, where, at present, natural vegetation, with the exception of the small forms of snow-lichens, etc., is impossible.

What do these accompanying facts show? Why, simply, that the fauna of the age was in harmony with the surroundings. In other words, that these birds with teeth lived largely, if not exclusively, upon the luxuriant vegetation. In this they but represented a fact which constantly shows itself throughout animate nature, viz.: Special forms of life exist by reason of special physical conditions, and local variations in species are possible within certain limits, though these limits are sufficiently well-defined, always, to preserve the characteristics of the species. The bird with teeth, then, came into existence as a demand of the period, and gradually vanished, as the demand passed away. It seems impossible to the writer to connect these birds with the reptiles as transition forms. The conclusion seems lame and impotent, and though the sound sense of the Evolutionist philosophers cannot be impeached, yet the *reductio ad absurdum* may be illustrated by imagining a chimpanzee constructed from a sea-serpent, and a four-tit built into a mastodon.

The point raised is susceptible of extended argument and analogy, but we have no need to ransack the records of vanished ages to tell the story of these birds. We have living birds with teeth in our own era! Those referred to inhabit Chili, in South America, and there is at least one specimen in our country. It is on exhibition at the rooms of the Cuvier Club of Cincinnati, and belongs to the private collection of the Hon. Thomas A. Logan, of that city. This bird, the *Phytoloma rara*, is about the size of an English sparrow. The teeth are not set in sockets, but consist of serrations in the mandibles. It is in no sense carnivorous, but lives entirely upon vegetation, and is very destructive to the young fruit buds and tender plants in the spring, as the writer has frequently witnessed. The bird is perfectly authentic, and has been described by Gilliss in his "Report of the Expedition to the Southern Hemisphere." There is probably a specimen of this trans-migrated little Saurian in the Government Collection at Washington.

C. A. L.

[We regret that lack of space forbids us to go into this question with our correspondent, for we should enjoy breaking a lance or two for the Evolutionists. However, those gentlemen are well able to take care of themselves, and so we will merely notice one or two points in "C. A. L.'s" communication. He says that no traces of plant life, except indefinite markings of sea weeds, have been found during the Silurian. We think that if he will look the matter up more carefully, he will find that lycopodiums and ferns have been discovered in rocks of that age.]

The question as to whether the toothed birds are transitional forms between the reptiles and the birds of the present era, is only to be decided by evidence. Anatomists, without exception, believe that they are; and in support of this belief, adduce facts, which, in our judgment, amount to incontrovertible arguments.

The strangest part of "C. A. L.'s" communication is, that after having shown that he knows perfectly well what teeth are, by speaking of them as "set in sockets, with a fang at one end and enamel at the other," he proceeds to speak of a living species which has the horny covering of the bill serrated, as toothed. If this be a toothed bird, our common ducks, geese and swans are toothed, and it is scarcely necessary to go so far as South America for a Living Bird With Teeth.—En.]

PRAIRIE CHICKENS IN NEVADA.

UNDER head of "Notes from California" in your issue of March 21 I notice that your correspondent "Amigo" has something to say upon the prairie chicken. Speaking of its extension westward, he tells us, but not without some evident misgivings, that there may have been a mistake somewhere of the supposed arrival of the chicken at Battle Mountain, Nevada, and the belief of his informant, Hon. B. B. Redding, of its eventual occurrence in California. I should be very sorry to destroy any well-founded hopes in a result so ardently to be hoped for by California sportsmen, but that there is an error I am quite sure, and believe further that it may be readily pointed out.

Coues, writing as late as 1874, says: "I have found no record of the prairie chicken (*Cupidonia cupido*) reaching, as yet, either Colorado or Wyoming." Without doubt he was correct in thus limiting the westward range of the bird, and a similar statement of its non-occurrence so far west as Colorado will, I think, hold good to-day. As a well-known matter of fact the prairie chicken is travelling westward, but very slowly, and certainly not in jumps of some thousand miles or more. That it will ever reach so far as the west coast is to the highest degree improbable; for, if deserts do not, mountains will surely prove an insurmountable barrier, just as they have to the bird we are now about to speak of.

What species, then, is it involved in the above statement of "Amigo's"? Why surely none other than the *Pedrocelus phasianellus columbianus*—a rather hard name, we must confess, but still one that will enable us to pin our bird down fast, and escape all danger of misleading. In other words, the southern sharp- or spike-tailed grouse. The name of "prairie chicken" is just as applicable to this bird as to the Capidonia, and whether it be or not, so is the sharp-tailed called in Northern California, Oregon, Idaho, and throughout that whole region.

I cannot make a positive statement of ever having, myself, known of this bird so far east in Nevada as Battle Mountain, having only passed through there on the cars, but I doubt not that it is actually found thereabouts, as this is by no means out of its range. Furthermore, I have an indistinct recollection of having noticed some of these grouse at one of the stations on the U. P. R. R. in Nevada, which were said to have been shot near by. Of the Oregon and Eastern California bird, I can speak with all positiveness, having seen it in more than one locality, and having last fall, in company with my friend Maj. Norvall, had many a crack at the sharp-tails about Camp Bidwell, Colorado, where they are numerous. In no part of this region, however, is its presence at all new, for this has been known as a part of its true home ever since we knew anything of the far Western avifauna.

In addition, let me say that sportsmen have no need to repine at the absence of the better known plumed grouse wherever the sharp-tail is found; for in all essential particulars of habits, it is the counterpart of that bird, and lies as well to the dog, flies as strongly and swiftly, eats as well, and is every whit as much of a game bird.

In return for his hint as to the introduction of the mountain quail into the East, let me suggest an attempt on the part of the California sportsmen to carry the sharp-tailed grouse beyond the western slope of the Sierras and into the fields of the rich river valleys, especially toward Northern California. Doubtless it is the presence of a high mountain

chain which alone has prevented this bird from occupying the Pacific slope, and once there, it must thrive and multiply, and afford no end of fine sport to those eager for it. It is already at their doors, and very little effort is needed to secure all the advantages which its presence affords both to sportsmen and epicures within reasonable distance of San Francisco.

"I echo "Amigo's" query, "Why does not some one interested in the game of that region introduce the mountain quail of California (*Oreortyx picta*) into the Middle States?" It is a splendid bird, and judging from its habits and the localities it frequents—high and rugged mountains—such an effort has all the likelihood of success that should commend it to the lover of fine game. Apropos of this I understand that such an attempt as this has been inaugurated by certain of the gun-loving men of Vermont, as Dr. Goldsmith, Mr. Meyers and others. To increase their chances of success their birds were procured from Oregon, as being harder and more likely to become accustomed to the deep snows which they must contend against in the Granite State. A trial of the same bird in Virginia has been talked of in Washington, though here the less robust valley quail would probably answer.

Washington, March 26, 1878.

H. W. HENSHAW.

BREEDING OF THE OPOSSUM.

BERLIN HEIGHTS, O., Feb. 25, 1878.

EDITOR FOREST AND STREAM AND ROD AND GUN:

I would request that sportsmen who have had opportunity to become familiar with the embryonic development of the opossum, would give their ideas of the same through your paper. I had the pleasure, about eight months since, of examining one, with twelve little ones in the marsupium or pouch, which was to me, indeed, a great curiosity. The little ones were no larger than half-grown mice, hairless, and grown fast to the teat of the mother. Now comes the query—how did they get there at that tender age? Did they originate there, or were they transplanted from the uterus of the mother to the quarters they then occupied? I have heard several theories advanced regarding this point, none of which are quite satisfactory to my mind. Tonic.

[This is a matter which, in the past, caused a world of discussion among naturalists. We have not space this week to discuss it, but shall do so later. In the meantime, we shall be very glad to have the views of any of our correspondents on the point raised by "Tonic."—Ed.]

THE WORMY TROUT OF THE YELLOWSTONE.—A correspondent writing from Portland, Oregon, inquires why the trout of the Yellowstone River are wormy. He says:

"While on a recent trip with Governor Howard's command, after the Nez Perce Indians, we struck the Yellowstone River, about the first of September, some six miles below the famous Yellowstone Lake, and found the river to be swarming with trout from fifteen to eighteen inches in length, but literally full of worms, not in the insides, but in the flesh. Cut them lengthwise along the sides, and there would be a mass of yellowish-looking matter ooze out at intervals along the cut, or as a half-breed Indian called it, worms. Otherwise the fish seemed to be all right, lively, and would fight to the end. Now, as this place is near the also famous Geyser Basin, in the National Park, and hot sulphur springs are everywhere all along the banks of the river—in fact the air in that section is full of the smell,—I thought, perhaps, that may have been the cause. The river was very swift, and perfectly clear, except a kind of sediment, coming as I thought from the springs. In taking up a cupful of water, it would seem to be full of small pulp-like balls, the size of a No. 8 shot and smaller. This same half-breed of whom I speak, told me that it was only the fish above the falls that were in this condition, which was found to be true. Reaching a place about twenty miles below the lower falls, and not getting time to experiment myself, I had a companion do so for me, and he reported 'no worms.' OCCIDENTAL."

[Mr. Omohundro ("Texas Jack") was calling our attention to the same fact only a few days ago. The parasite with which these fish are afflicted was first described by Professor Leidy in 1872, under the name of *Dibothrium cordiceps*. Although the trout of the lake, and of the river above the falls, are especially subject to the attacks of this creature, we have taken many below the falls that had the worms in their flesh. The "sediment" of which our correspondent speaks is thought to be the fruit of some aquatic plant, but its nature is not well understood. It is said to be present in the water only during the late summer and autumn. We do not imagine that the presence of sulphur springs in the region has anything to do with the worms in the trout.—En.]

BIGHORN ON THE BIRDWOOD.—Our friend, "L. H. N.," writes us from Nebraska that a bighorn (*Ovis montana*) was seen last autumn on the head of the Birdwood in that State. We have never before known of a sheep being found so far to the eastward along the Platt River. The individual probably came from somewhere in the neighborhood of Scotts Bluffs, but what induced it to wander so far from its usual feeding grounds?

DEER SHEDDING THEIR HORNS.—Bromfield House, Boston, March 18.—The big buck in the park on our common has not yet shed his horns, although they look bleached and dead as sticks. Our might conjecture that he is aware of the controversy in the FOREST AND STREAM and is waiting to have the question decided, that he may drop them at the proper time; but, in my note book of last year, I find: March 15—"The big buck has shed one horn and carries the other." I thought it strange, having shot two in Jan. that had evidently dropped them some weeks before. I am too green in the business to take sides on the question of hurrying, but it looks quite reasonable that the time of shedding should vary according to locality, the age and condition of the animal. M.

[We quite agree with our correspondent that it is impossible to decide difficult points like those to which reference is made above, by what takes place in captive animals.—En.]

MILLIONS IN IT.—Wareham, March 1st, 1878.—In the FOREST AND STREAM AND ROD AND GUN of Feb. 7th, Dom Pedro, of Pottsville, Pa., reports a rare quadruped in the form of a white weasel with a black tipped tail, for which its captor received twenty-five dollars (\$25). Well, that was a good price for a weasel, and perhaps it was cheap for that market, but while they are rare there they are not particularly so in

this locality, there being no less than three captured ones in my neighborhood. Notwithstanding the high rates in Pa. I should quote the genuine white weasel with black tipped tails in our market at one dollar each. Thus it can readily be seen that at a reasonable rate for freight between the two points there can be a handsome living margin in the white weasel enterprise.

C. L.

THE LINNEAN SOCIETY OF NEW YORK.—A meeting of the society was held on the evening of Saturday, March 30, at the residence of Mr. N. T. Lawrence. In the absence of Mr. C. H. Merriam, the President's chair was occupied by Mr. Herriek, and the Secretary failing to appear, Mr. Benner was appointed Secy. pro tem. Papers were presented by Mr. Herriek on "Falcons and Falconry," and by Mr. Benner "On the Breeding of Certain Birds about Astoria, L. I.," while Mr. H. B. Bailey read copious extracts from Robert Collett's "Catalogue of the Birds of Norway," commenting thereon. The literary exercises were of much interest, and were followed by the usual verbal communications and miscellaneous business, after which the meeting adjourned, several papers being left over for next week.

ENGLISH PHEASANTS IN CALIFORNIA.—J. P. Whitney, of Placer Conny, Cal., recently imported 400 eggs of the English pheasant, from which he has succeeded in hatching out some 60 birds. They are now some four weeks old. He keeps them in an enclosure 40x60 feet in area, with a shed at one end to which they can retire for seclusion.

DEFORMED TEETH.—R. L. N., of Salem, Mass., says: "Noticing cut as to woodchucks' teeth, I would remark that in the county collection of the Peabody Academy of Science in our city, is a woodchuck with upper teeth grown through the lip close to its nose. I think the specimen is also albino."

CAMELS IN THE SOUTHWEST.—The *Arizona Miner* says: "For nearly a year past four camels have been running at large in the vicinity of Mineral Park—three old ones and a young one. One of the old ones looks to be quite ancient, and it may be that it is one of the original stock imported from Asia many years ago. These animals are very gentle. A few days ago Mr. Knobman was out hunting stock and he came across these camels, but his mule objected to an intimate acquaintance, and commenced bucking. Horses and mules are frightened at the sight of them. In Nevada and Idaho, and I think Montana, there is a law against using these animals in towns or traveling on the roads, as they frighten stock. There seem to be no owners for these camels, and in time they may increase and become numerous."

Apropos of this item is one that recently appeared in the *Louisville Courier-Journal* to the effect that camels are very easily raised, and require but very little care. The females are said to produce one young one each year, the colt at first being somewhat delicate, but after a day or two it is well able to look out for itself. Their food consists almost entirely of sage brush and cactus, and they are said to thrive where a government mule would starve.

ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDEN, FAIRMOUNT PARK, APRIL 3, 1878.—Two spotted salamanders, *S. maculosa*, presented; one Bactrian camel, *C. bactrianus*, born in garden; two alligators, *A. mississippiensis*, presented; one ruffed grouse, *Bonasa umbellus*.
ARTHUR E. BROWN, Gen'l Supt.

ARRIVALS AT THE ZOOLOGICAL GARDEN CINCINNATI, TO APRIL 1.—One prairie dog, *Cynomys ludovicianus*, born in garden; one tiger, *Felis tigris*, deposited by Deils Bros.; one aoudad, *Ammotragus tragelaphus*, born in garden; forty Virginian quail, *Ortyx virginianus*, purchased; one ruffed grouse, *Tetrao umbellus*, deposited; three flying squirrels, *Sciuropterus volucella*, presented by J. & J. M. Pfau; one red-tailed hawk, *Buteo borealis*, presented by C. A. Gillette; one bald eagle, *Haliaeetus leucocephalus*, presented by P. O. Sharpless; one pony, *Equus caballus*, purchased; eight pea-fowls, *Pavo cristatus*, presented by Miss Stillings; one Cashmere goat, *Capra hircus*, born in garden; one alligator, *A. mississippiensis*, presented by steamer "Golden Crown;" sixteen undulated grisea parakeets, *Melospitta undulatus*, hatched in garden; three spitz pups, *Canis domesticus*, born in garden.
H. P. INGALLS, Superintendent.

Woodland, Farm and Garden.

THIS DEPARTMENT IS EDITED BY W. J. DAVIDSON, SEC. N. Y. HORTICULTURAL SOCIETY.

THE NEW YORK HORTICULTURAL SOCIETY.

It gives us much pleasure to state that the monthly meetings of this growing society show that the love for the beautiful in nature in the people of New York has only been lying dormant, for at the last meeting not only was the attendance large, and the interest exhibited in all the beautiful plants and flowers unflagging, but the display brought forward by our principal nurserymen and florists was really surprising, more especially as it is gratuitous and the meetings or exhibitions entirely free to the public. Mr. William Bennett, Flatbush, L. I., filled a large table with a most gorgeous display of orchids and other flowering plants, the most notable of which were a finely grown plant of *Dendrobium nobile* with magnificent spikes of bloom *Cypripedium harrisiannum*, *C. Lowii*, *C. barbatum majus*, *C. villosum*, *Cattleya Skinnerii*, *Anthurium Schertzerianum*, a magnificent variety with very large spathe; some well grown *Azaleas*, the most beautiful of which were *Madame Van der Cruyzen*, *Marquis of Lorne*, *A. Horsg*, *Sauvenir de Prince Albert*, *Flag of Truce* and *Neptune*. Mr. Isaac Buchanan, Astoria, L. I., had a beautiful lot of seedling *Azaleas*, and R. B. Parsons & Co. had also a nice group of the newer sorts of *Azaleas*, well grown and bloomed. Mr. F. Roenbeck, Bayonne, N. J., exhibited a collection of 28 of his new seedling *Begonias* of the *B. rex* section and six *Ferns*, which received a special commendation

and were much admired. Mr. Mayne, gardener to Mrs. Morgan, Twenty-sixth street, brought two fine plants of the rare and beautiful yellow orchid *Cattleya citrina*. Mr. Thos. Ascott, Flatbush, *Pelargoniums* and large *Azaleas*; Mr. J. Roehrs, Jersey City, a collection of *Tulips*; Mr. John Henderson, Flushing, *Lady Blanche Pinks* and *Roses*, and Mr. Jas. Riddle Iuwod a well grown plant of the beautiful blue *Broussaisia clata*. In cut flowers Mr. George Such, South Amboy, N. J., as usual took the lead with a rich collection including fine sprays of *Dendrobium nobile*, *D. thyrsiflorum*, *D. macrophyllum giganteum*, *Anthurium schertzerianum*, *Angracum sesquipedale*, some splendid sprays of the newer sorts of *Azaleas*, and *Rhododendrons formosum*, *limbatum*, *Princess Helene* and *Veitchianum*. He was closely followed by Mr. S. Heushaw, Staten Island, who, in addition to a splendid display of cut flowers, including the exceedingly curious *Bryophyllum calycinum* or life-plant, exhibited cucumbers 26 inches in length and mushrooms large as saucers. Mr. John Jones, Madison, N. J., who is well and favorably known as a rose grower, showed a specimen of his skill in a group of over twenty sorts that would be hard to match by the most extensive growers of this most lovely flower, his *Cornelia Cooks*, *La Sylphides*, *Sprunts* and *Bon Silenz* being particularly admired. Many other florists brought their quota of what they had rare or desirable and made the meeting a most enjoyable one. At the close of the business part of it Mr. Peter Henderson read an essay which was listened to with marked interest and attention on

CITY AND SUBURBAN GARDENS.

If a horticultural society conduces to the improvement of our city and suburban gardens, there is probably nowhere in the civilized world where the necessity for one exists more than for the city of New York. Take the European cities, London, Paris, Berlin, Edinburgh or Dublin, or our own cities of Philadelphia, Boston, Baltimore or Cincinnati, and the gardens of their suburbs show that we are yet far behind them in the taste in which our suburban gardens are laid out and planted. It is a most common thing to see with us a building erected at a cost of \$20,000, furnished, perhaps, at a cost of \$10,000 more, while the grounds surrounding the house are left to be "laid out" and planted by some ignorant pretender, who manages to make the owner believe, by a few high sounding phrases that he has got by rote, that he is a veritable landscape gardener. We have, necessarily, all phases of intelligence among gardeners in the various grades of the business, but it is quite as unreasonable to expect good taste in a landscape gardener destitute of intelligence, as it would be to expect good taste or good judgment in an ignorant architect. We know that no house architect can prosecute his business without being educated to it, while it is a deplorable fact that the "architects of the garden" (if we may so term them) often undertake the business while utterly ignorant of the first principles of the art.

One of the most ridiculous cases of this kind came to my notice a few years ago. A gentleman owned a plot in the suburbs about the size of an ordinary city block in extent. After building a most expensive house in the rear of the plot, he engaged a gentleman who dubbed himself a "landscaper" to lay out the grounds. The plot was some 200 feet wide by 400 deep. Teddy's first operation was to start a walk from the street to the house, which, had it been a straight line, would have been about 300 feet, but Teddy, the "landscaper," had a true artist's horror of straight lines, and had the walk curved like a corkscrew, so that to reach the house from the street nearly 600 feet had to be traveled instead of 300. This walk was laid through the centre of an unplanted lawn, and was allowed to remain some years before the shoddy owner realized its absurdity. There is not the time here, nor have I the ability if there was, to say much about the proper manner of laying out the suburban garden, but there is one common-sense rule in laying out walks or roads that should never be lost sight of. This rule, first laid down by Loudon, I believe, is that there never should be any deviation from a straight line, unless there was some real or apparent cause. This is common sense. Presuming this room was entirely empty, and I wanted to get to that window, I would undoubtedly use the shortest distance between the two points—a straight line; but if it was, as it is now, filled with seats in the centre, I would naturally go around without hardly thinking of the obstacles in the way. It is just so in the walks in the garden or grounds. Unless there is some reason for deviating from a straight line—rocks, trees, flower beds, or some such obstacle—we must make one, that is, when curved lines are wanted, if there are not shrubs or flower-beds to get around, we must plant them in the angles of the curve, else the uselessness of going a roundabout way, without a cause, for so doing, will be apparent, and grate on the senses.

What to plant in the suburban garden is an all-important consideration. If there is extent enough, say an acre in area, it should, to be complete, have its due complement of space allotted for fruits, flowers and vegetables. What the varieties of these should be is so much a matter of detail that no allusion can properly be made to them here.

I will simply say that good taste requires that the fruits and vegetables be planted in the rear of the plot, and the flowering or ornamental part in the front. In any case, at least, there should be no mixing up when there is room to separate them, for it is just in as bad taste to plant vegetables and flowers on the lawn in front of your dwelling, as it would be to have the cooking and washing done in the parlor when there are separate rooms for such work. Some may think that such absurdities are never practiced, but they certainly are. I passed every day last summer in front of a \$15,000 dwelling, where the coarse-grained owner had mixed up the useful with the ornamental in such a way that it would have been hard to determine whether it was a flower-plot or a cabbage garden. This heterogeneous planting may be perfectly proper in the owner of a shanty who may indulge his esthetic taste by planting a few flowers where it is necessary for him to grow his corn or potatoes; but in my opinion it is utterly inexcusable where there is any pretension to well kept suburban grounds.

While the ownership of the suburban garden has its pleasures it has also its troubles; not only has the occupant to submit to the onslaught of the usual crop of book peddlers, sewing machine agents and the thousand and one vendors of patent wonders that his city friend has to submit to, but he is the special victim of the irresponsible tree and shrub peddler, who generally manages to sell him a mass of rubbish, and often supplements the injury by telling him how to plant it; for he it is known that not one in a hundred of these tree agents are

practical gardeners, and hence are utterly unfit to instruct. One stereotyped piece of knowledge that many of them seem to possess, is to advise the placing of a quantity of stones in the hole where a tree or shrub is to be planted, and which advice the owner often religiously follows at great expense. I need not say that this practice is consummate nonsense, and if it has any effect at all it would be injurious, as, of course, the stones displace just so much good soil. These remarks do not apply to accredited agents from responsible firms, but there are hundreds plying their vocation who are not such, and it is against such we would warn you.

There is yet another class in whose attractive nets the amateur horticulturist gets often entangled. These gentlemen are now distinguished by the name of the "Blue Rose men." For the past ten years they have never failed to plant themselves in some prominent location in this city—usually in Broadway; they are in all probability there now, for this is their season of harvest, and their victims are the owners of our suburban villas and city gardens. The blue rose men have usually just arrived from Paris, at least they say they have, such wonders could come from nowhere else. Unfortunately, their goods being all imported, they cannot well show them in flower or in fruit, so they have to resort to pictures; by these you can have ocular evidence that they have to sell cherry trees bearing fruit as large as apples, strawberries growing on trees as large as cocoanuts, gigantic asparagus, of which they will sell you the seeds that in ninety days from time of sowing will produce a full crop!

But fruits and vegetables are thrown entirely in the shade by their flowers. Here you can have blue moss roses, blue tea roses, blue dahlias, blue and coal black gladioli, and a wonderfully rainbow-spangled, nondescript flower that the blasphemous wretches call the "Hand of God." This last is very expensive, and ranges according to variety from \$3 to \$10 each. To my untutored mind this "Hand of God" flower looked suspiciously like the common columbine or *Agavelegia*. The wonderful strawberry tree was the calycanthus, while the blue moss roses were very good specimens of the red Prairie rose, which no doubt had been imported from some Long Island or Jersey nurseryman at \$12 per 100, which by the time they had got to New York became, in the hands of the gentlemen from Paris, blue moss roses, ready to be sold at \$5 apiece!

I will not insult the intelligence of the members of the New York Horticultural Society by supposing that any of them were ever at any time the victims of these vandals. But if others become victims by failing to become members of our society, and thereby losing the knowledge that such membership gives, I feel like saying that if any such should pay \$5 for a blue rose or a strawberry tree—rather than to give the same amount yearly to the society—served him right! But little can be said about "city gardens" proper. The area is so limited that there is less scope for display either of good taste or bad taste, and to even suggest what would be most satisfactory to plant would be nearly useless.

The most available space is usually the fences. An excellent effect may be had by training against these roses, honeysuckles, or other climbing plants, intermingling the colors. These trained close to the fences will interfere but little with the borders, which can be planted with whatever flowers the inclination may suggest, only they should be such as are close growing. In fruits, about the only satisfactory things are grape vines. These, also, may be trained on trellis work against the fence or on a separate trellis. In half a dozen varieties of grape vines for the city garden, I would suggest Concord, Iowa and Roger's Nos. 4, 15, 22 and 44. These would embrace about all the varieties of color, and succeed each other in ripening during the season. If the owner of a city garden has any proclivity for vegetables, he should try and confine it to half a dozen tomato plants, which should be trained against the fences. But it must be borne in mind that whether fruits, flowers or vegetables are planted, to do well they must have at least three or four hours' sunshine. If the garden is entirely shaded, it is useless to expect much satisfaction from anything that can be planted. We are asked hundreds of times every season the question of "What plants will grow in the shade?" and the answer is ever meagre and unsatisfactory. It is true that such plants as pansies, forget-me-nots, lobelias, lily of the valley, and such herbaceous plants as are natives of shady woods, will do with partial sunlight, but their flowers are never so bright or so well developed as in the open sunshine. Therefore, for shady city gardens, flowering plants should not be attempted, as a far more satisfactory result can be produced by the use of what, for want of a better term, we call "foliage plants," such as the variegated leaved geraniums, coleuses, fancy caladiums, cannas, etc., and marked colored foliage may be used for ribbon lines or for massing in distinct colors, such as achyranthus, centaureas, alternantheras, golden treflow, etc., but in any case do not get your small city garden overcrowded. Plants should not be planted so close as to run into each other and form a tangled mass. This is one of the commonest errors, and one, too, that the unsophisticated owner is often apt to fall into, from his desire to have an immediate effect produced. Sometimes, however, he overflows from accident that no previous knowledge could guard against.

I recollect some years ago among other European novelties that we imported, was a plant called *salvia gigantea*, which came to us with the usual array of magnificent adjectives. We modestly followed suit in describing it, and our description happened to arrest the attention of the owner of a 7x9 city plot. I sold him a plant, and remember he complained bitterly of the small quantity he got for his money. He planted it, however, and he soon got more than he bargained for. He wanted to see the magnificent flower, and dared not cut a branch of it. So it kept on increasing in breadth and stature, until it not only took possession of his whole plot, but bid fair to take possession of his house also. But, luckily, Jack Frost came to the rescue, and one October night stopped its progress. That man never forgave me for what he considered a mean practical joke; but it was not, for I did not know when I sold him the plant whether he was going to plant it in a city garden or a ten-acre lot. Had he planted it in a ten-acre lot, and had Jack Frost not interfered, I have no doubt that *Salvia gigantea* would have done all that we claimed for it.

ICE TO THE NORTHWARD.—The northeast is still ice-bound, and the Strait of Northumberland, separating Prince Edward's Island from Nova Scotia, is full of ice as far as the eye can reach. Last Saturday the mails and passengers from the Gulf of St. Lawrence steamer were landed at Cariboo and brought to Pictou, N. S., by teams, having crossed over the ice to the land, the steamer lying three miles off shore.

—Track laying on the Canadian Pacific Railway is progressing three-quarters of a mile daily.

The Kennel.

TO CORRESPONDENTS.—Those desiring us to prescribe for their dogs will please take note of and describe the following points in each animal:

1. Age. 2. Food and medicine given. 3. Appearance of the eye; of the coat; of the tongue and lips. 4. Any changes in the appearance of the body, as bloating, drawing in of the flanks, etc. 5. Breathing, the number of respirations per minute, and whether labored or not. 6. Condition of the bowels and secretions of the kidneys, color, etc. 7. Appetite; regular, variable, etc. 8. Temperature of the body as indicated by the bulb of the thermometer when placed between the body and the foreleg. 9. Give position of kennel and surroundings, outlook, contiguity to other buildings, and the uses of the latter. Also give any peculiarities of temperament, movements, etc., that may be noticed, signs of suffering, etc.

FIXTURES FOR 1878—BENCH SHOWS.

Baltimore Kennel Club's Show, Baltimore, Md., April 23, 24, 25 and 26. L. R. Cassard, Secretary.
The Westminster Kennel Club (New York) Bench Show, Gilmore's Garden, May 14, 15, 16 and 17. Dr. W. Seward Webb, Secretary.

For Forest and Stream and Rod and Gun.

THE ROSE TREE FOX-HUNTING CLUB.

THE Rose Tree Fox Hunting Club, as a definite and regular club, was organized September, 1873; but for a number of years previously the gentlemen who founded it had hunted together, and many of them are descendants of families who have hunted in the county as long as Delaware County has been one. Formerly the packs were all trenched ones, each man keeping from one to a half dozen couples of hounds. About 1853, J. Howard Lewis, Esq., and Geo. E. Darlington, Esq., began to keep their hounds at the Rose Tree Tavern, on the Providence road, about one and a half miles above the Court House, which had just been located in the present town of Media. The Rose Tree was then kept by Morg. Baker, and the hounds remained there for several years. These gentlemen, gradually joined by others, some years later moved to the Lamb Tavern, kept by Woodward, but owing to the landlord's intentionally crippling a fox, the kennel was moved to Tom McClure's farm. McClure always kept a few good hounds of his own until the winter of 1875-76, when he met with an accident hunting, and was killed. About 1869 the locality of the hunt was changed to the Black Horse in Middletown township. The leaders now were Messrs. J. Howard Lewis, Samuel Lewis, Prof. Fairman Rogers, who had his country place near Concord, and Mr. E. Farnum. While here they were joined by Mr. Geo. Hill, the present Mr. F. H., who was living on Chester Creek, and hunting with John Mahoney, Mr. Henry Saulnier and Mr. Mark Pennell. The former is now at three score years and ten, as true a fox hunter as ever followed hounds, and keeps the same blood in his kennel for which he has always been famous. Without children he and his wife live on a small farm, where, as he says, he "always has mate for the hounds and milk for the puppies," and at any time you can find a lot of puppies occupying the warmest corner of the fire; and Mrs. Mahoney will say, pointing to one or the other, "Now, isn't he pretty." About the same time, Henry E. Saulnier, Esq. (who lived formerly in New York, but was attracted to a country place near Ivy Mills on account of the beauty of the scenery and the hunting), joined. The hounds were moved back to the "Laub," then kept by Benjamin Rodgers, and the next year, 1872, the Rose Tree was bought by Messrs. J. Howard Lewis, Samuel Lewis, Prof. Fairman Rogers and Mr. E. Farnum, the hounds sent there, and "Benny" came as landlord. The club was then regularly organized with six to seven couple of members, with Mr. Geo. Hill, M. F. H. and President; Mr. J. Howard Lewis, Vice-President; Mr. Geo. Lewis, Treasurer, and Mr. Samuel Miller, Secretary. It has gradually increased in size until there are now about two score and six.

On the Saturday night or before each full moon, the members meet at the Rose Tree, where Benny has a turkey or a six weeks' pig roasted, as only a fox hunting Quaker can roast. After supper the club attends to what business there is, and the "celebra" intended upon men meeting for sport and as fellow fox hunters, the reputed most brotherly race of men existing. During the season, *i. e.*, from November to the middle of March, the hounds hunt on Mondays, Thursdays and Saturdays, and usually a fourth day is added. The present officers are: Mr. George Hill, President and M. F. H.; Mr. Henry Saulnier, Vice-President, and Mr. Corlies the efficient Treasurer and Secretary, who is much better at doing two men's work than our two officers were formerly at doing none at all. Among our best riders I may mention Mr. Henry Saulnier and Mr. J. Howard Lewis, both over three score years of age, who sit on a horse as gracefully and lightly as any younger man; and, although they do not show the ardor to speed a horse when Reynard first breaks cover, you may be sure to see them well on to the hounds when more than half the field are scattered over the country, stopping every one they meet with, "Say, Mister, have you seen anything of the hounds?" Mr. Hill is one of the sure riders who, however badly out he may be, knows by instinct where he can best bring in the tail hounds and puppies. Mr. Fairman Rogers is sure to be gracefully riding to the front, without any apparent exertion, on Josephine or his sorrel mare, and in close company you see Mr. Sam Miller, riding, with his saddle, a full fourteen stone and a half. Very possibly his shoulders are muddy, but he is a poor rider who don't muddy himself occasionally. For a hard rider we are best represented by Mr. Sam Lewis, who, after hunting for over forty years, cannot see why some men complain of a "horse being hard to hold;" he never saw such one, but only wants a good "Ash plant." Mr. ——— Lewis (but it is unnecessary to mention first name, for all Lewises are either good or hard riders). Dr. Bray and Mr. Robinson are also men who have no idea of the comparative height of fences or the value of necks. The farmers through the county, with but a few exceptions, are generous and hospitable to fox hunters, and many of them hunting themselves, they will protect the foxes. At present I know of several bitch foxes with pups, who are fed from the farmers' kitchens. Mr. Jessie Hickman, M. F. H., Thornbury; Mr. Jeff Shaner, M. F. H., Westchester, and Mr. Pratt Bishop, M. F. H., Eligmont, are honorary members, of the Rose Tree, and an honor they are. Two of them have kept and hunted hounds for half a century. The hounds have just

been heavily drafted, leaving none but those with whose noses, tongues and running no one but a professional grumbler could find fault. The hounds we keep are as follows:

Hunter, from Centerville stock; Blue Bear, from Welsh Mountain stock; Chill, Mingo—Fanny; Mose, Hessa—Piper—Flora; Lender, Drummer, Chaser, Moore's Drum—Rodger's Lucy; Spot, Pearce's—Vanity; White, Joe, Rattler—Vanity; Dexter, Drummer—Fanny; Dan, from Leiper's kennel; Trailer, Sounder—Flora; Tuck, Mercury, Mingo—Juno; Fashion, Sounder—Flora; Lully, Slasher—Flora; Juno, Mahony's—Vanity; Duxy S., Wallace—Vanity; Hornet S., from Yerkes kennel; Nora S., Mingo—Fanny; Gipsy, Dea; S., Rattler—Vanity; Minerva, Nip, Fauny, Mingo—Juno Dule, from Maryland.

BALTIMORE BENCH SHOW OF DOGS.

LIST OF SPECIAL PRIZES.

Class 12—Best Native Setter Dog or Bitch, any strain—A fine double-barreled breech-loading shot-gun in case, complete, manufactured and presented by Alexander McComas, dealer in sportsman's goods, Baltimore. Value, \$200.
Class 43—Best Imported Setter Dog, any strain—\$25. Bitch, any strain—\$25.
Class 44—Best Pointer Dog, imported or native, any weight—\$25. Bitch—\$25.
Class 45—Best Braco English Setter, imported or native—A fine shooting suit, presented by Henry Dopkin, Tailor, Baltimore. Value, \$50.
Class 46—Best Braco Irish Setter, imported or native—A fine moleskin shooting suit, presented by Rosenfield Bros. & Co., Clothiers. Value, \$35.
Class 47—Best Braco Gordon Setter, imported or native—A corduroy shooting suit, presented by F. L. Sheld on, Newark, N. J. Value, \$28.
Class 48—Best Braco Pointers, imported or native, any weight—A magnificent cartridge belt, with solid silver buckle, handsomely engraved with the heads of two noted dogs and strings of game, also bearing monogram of B. K. O. Value, \$60.
Class 49—Best Braco Native Setters—A Colt's new model revolver, gold mounted, ivory handle, in case, presented by Edward Melchior, Baltimore. Value, \$35.
Class 50—Best Imported English Setter Stud Dog, to be shown with two of his get—A handsome oil painting—game piece—presented by Don Foster, artist. Value, \$50.
Class 51—Best Native English Setter Stud Dog, to be shown with two of his get—A handsome oil painting—game piece—presented by Renben Johnston, artist. Value, \$50. Also frame for same, presented by Myers & Hedian, Baltimore. Value, \$18.
Class 52—Best Irish Setter Stud Dog, imported or native, to be shown with two of his get—Two beautiful landscapes, by Way, presented by a member of the club. Value, \$60.
Class 53—Best Gordon Setter Stud Dog, imported or native, to be shown with two of his get—A silver water pitcher and waiter, presented by Canfield Bros. & Co., Baltimore. Value, \$25.
Class 54—Best Pointer Stud Dog, any weight—A silver cup, presented by Trimble & Kleibacker, gun dealers, Baltimore. Value, \$75.
Class 55—Best Native English Setter Brood Bitch, to be shown, with two of her progeny—A silver wine cooler, presented by Geo. W. Webb Jeweler, Baltimore. Value, \$25.
Class 56—Best Imported English Setter Brood Bitch, to be shown with two of her progeny—A subscription to "Upland Game Birds." Value, \$25.
Class 57—Best Irish Setter Brood Bitch, imported or native, to be shown with two of her progeny—A shooting suit, presented by N. Walker & Co., clothiers, Baltimore. Value, \$10.
Class 58—Best Gordon Setter Brood Bitch, imported or native, to be shown with two of her progeny—A splendid hunting coat, presented by H. H. Lucko & Sons, tailors, Baltimore. Value, \$40.
Class 59—Best Pointer Brood Bitch, any weight, to be shown with two of her progeny—A magazine revolver, gold mounted, handsomely engraved, with pearl handle, with one hundred cartridges, presented by E. Remington & Sons. Value, \$25.
Class 60—Best Native English Setter Puppy, dog or bitch, under 12 months of age—A pair of gunning boots, presented by Geo. B. Clogg, boot and shoe maker, Baltimore. Value, \$18.
Class 61—Best Imported English Setter Puppy, dog or bitch, under 12 months of age—A fine field glass, presented by G. T. Sadtler & Sons, opticians, Baltimore. Value, \$20.
Class 62—Best Gordon Setter Puppy, dog or bitch, under 12 months of age—Half dozen fine shirts, presented by Wm. P. Towles & Bro., gentlemen's furnishing goods, Baltimore. Value, \$18.
Class 63—Best Irish Setter Puppy, dog or bitch, under 12 months of age—Half dozen fine shirts, presented by R. Adams, manufacturer of shirts, Baltimore. Value, \$18.
Class 64—Best Pointer Puppy, dog or bitch, under 12 months of age—A glass-ball trap and one barrel of glass balls, presented by A. H. Bogardus. Value, \$15.
Class 65—Best Collection of Foxhounds, not less than two couple—A saddle, presented by J. D. Hammond, saddler, Baltimore. Value, \$20. Also, one riding bridle, presented by H. H. McNally & Co., Baltimore. Value, \$10.
Class 66—Best Couple of Foxhounds—A saddle, presented by J. H. Boyd, saddler, Baltimore. Value, \$35. Also, a riding bridle, presented by H. W. Horman, Baltimore. Value, \$15. For the second best couple, a pair of riding boots, presented by Buck, Hefebower & Nair, Baltimore. Value, \$18. For the third best couple, a pair of riding pants, presented by Roberts & Co., tailors, Baltimore. Value, \$15.
Class 67—Best Couple Beagles—A nickel-plated revolver, in case, presented by Phillips & Davis, Baltimore. Value, \$20.
Class 68—Best Chesapeake Bay Dog—A complete rubber suit, presented by Townor, Landstreet & Co., dealers in rubber goods, Baltimore. Value, \$25.
Class 69—Best Chesapeake Bay Bitch—A complete rubber suit, presented by the Goodyear Rubber Co., Baltimore. Value, \$25.
Class 70—Best Chesapeake Bay Dog or Bitch Puppy, under 12 months of age—Two pairs fleece-lined ducking stockings, presented by J. P. Hartman & Son, Baltimore. Value, \$10. Also, a silver cup, presented by Chas. W. Hamill & Co., Value, \$10.
Class 71—Best Dachshund, dog or bitch—A case of Hock wine, presented by Thos. A. Agnew & Co., Baltimore. Value, \$10.
Class 72—Best Fox Terrier, dog or bitch—A parlor rifle, presented by C. H. Schumacher, Baltimore. Value, \$10.
Class 73—Best Scotch Terrier, dog or bitch—A case of wine, presented by May & Fairall, grocers, Baltimore. Value, \$18.
Class 74—Best Skye Terrier, dog or bitch—An album, presented by R. Walz, Baltimore. Value, \$5. Also one satchel, presented by R. Lawson & Co., Baltimore. Value, \$10.
Class 75—Best Black and Tan Terrier, dog or bitch, any weight—Cash, \$10.
Class 76—Best Pug, dog or bitch—Twenty-four bottles "Grand Duquesse Cologne," presented by W. H. Read, Baltimore. Value, \$6. Also a silver cake basket, presented by Shirley & Son, Baltimore. Value, \$10.
Class 77—Best Shepherd or Collie Dog or Bitch, rough or smooth—One pair silver cake baskets, presented by S. Child & Son, Baltimore. Value, \$20. Also one album, presented by R. Walz, Baltimore. Value, \$5.
Class 78—Best Rough Shepherd or Collie Dog or Bitch—A cup, presented by Dr. J. W. Doumoy, East New Market, Md. Value, \$10.
Class 79—Best Chesapeake Bay Dog or Bitch—Hazard's Powder presented by D. J. Foley, Bro. & Co. Value, \$20.
Class 80—Best Chesapeake Bay Dog or Bitch—8 bags shot, 25 pounds each, presented by Merchants' Shot Tower, Baltimore; 8 bags chilled shot, 5 pounds each, presented by Tatham Bros., N. Y. Value, \$25.
Class 81—Best English Setter, imported or native, dog or bitch—8 bags shot, 25 pounds each, presented by Merchants' Shot

Tower, Baltimore; 8 bags chilled shot, 5 pounds each, presented by Tatham Bros., N. Y. Value, \$25.

Class 82—Best Irish Setter, imported or native, dog or bitch—8 bags shot, 25 pounds each, presented by Merchants' Shot Tower, Baltimore; 8 bags chilled shot, 5 pounds each, presented by Tatham Bros., N. Y. Value, \$25.

Class 83—Best Gordon Setter, imported or native, dog or bitch—8 bags shot, 25 pounds each, presented by Merchants' Shot Tower, Baltimore; 8 bags chilled shot, 5 pounds each, presented by Tatham Bros., N. Y. Value, \$25.

Class 84—Best Pointer, imported or native, dog or bitch—8 bags shot, 25 pounds each, presented by Merchants' Shot Tower, Baltimore; 8 bags chilled shot, 5 pounds each, presented by Tatham Bros., N. Y. Value, \$25.

Class 85—Best Native English Setter Dog or Bitch—Cash, presented by Col. Chas. P. Montague, President of the Society for the Prevention of Cruelty to Animals, \$25.

Class 86—Best Pointer or Setter Dog or Bitch, imported or native—A long-range rifle, presented by Clark & Snyder, Baltimore. Value, \$75.

Class 87—Best Chesapeake Bay Dog or Bitch, short-haired—A cup, presented by Clark & Snyder, Baltimore. Value, \$15.

Any additional special prizes will be published in the sporting papers. The entrance fee for special prizes will be \$3, except in cases where the special is under \$20, when the entrance fee will be \$1. In judging stud dogs and brood bitches, their progeny will alone be considered. Chas. Lawson, Sup't, P. O. Box 767. Show takes place April 22d, 23d, 24th and 25th.

BALTIMORE BENCH SHOW.—Baltimore, April 7.—Since my last letter the following entries of first-class stock have been made: S. R. Dillie, Lake City, Mich., whole kennel, including the celebrated dog, Ranger; L. H. Smith, Canada, will bring his entire kennel, including Paris and Lester (Mr. Smith is the breeder of Gladstone, the winner of the Nashville field prize last year, and also winner of the four first prizes at the St. Louis Exhibition); Arnold Burges, of Hillsdale, Michigan, will enter Rufus, Rob Roy, and Queen Mab; the St. Louis Club have entered their entire kennel, including the celebrated Irish setters, Melcho II., Berkeley, Duck, Erin and Sting II.; R. C. Sterling will enter his famous pointer Sleford, winner of the first prize at Birmingham, England; also, Bow, the winner of the first prize at many of the principal English bench shows. THAYMOON.

ADDITIONAL PRIZES.—Mr. L. R. Cassard, the Secy. of the Baltimore Kennel Club, informs us that the Messrs. Tiffany & Co., New York, donate a cup, the class to which it is assigned will be announced next week. Messrs. Parker Bros. give a fine breech-loading gun, value \$125, for the best kennel of Gordon setters. The entries for the above special will not close until the 20th.

NEW YORK BENCH SHOW.

PREMIUM LIST OF THE SECOND ANNUAL BENCH SHOW OF DOGS, UNDER THE AUSPICES OF THE WESTMINSTER KENNEL CLUB, GILMORE'S GARDEN, MAY 14, 15, 16, 17.

Class 1—Mastiffs—Dogs—Best, \$25; second, \$15; third, silver medal.
Class 2—Mastiffs—Bitches—Best, \$25; second, \$15; third, silver medal.
Class 3—Rough-coated St. Bernard Dogs—Best, \$25; second, \$15; third, silver medal.
Class 4—Rough-coated St. Bernard Bitches—Best, \$25; second, \$15; third, silver medal.
Class 5—Smooth-coated St. Bernard Dogs—Best, \$25; second, \$15; third, silver medal.
Class 6—Smooth-coated St. Bernard Bitches—Best, \$25; second, \$15; third, silver medal.
Class 7—Newfoundland Dogs and Bitches—Best, \$20; second, \$10; third, silver medal.
Class 8—Siberian or Ulm Dogs or Bitches—Best, \$20; second, \$10; third, silver medal.
Class 9—Bloodhounds, Dogs or Bitches—Best, \$20; second, \$10; third, silver medal.
Class 10—Greyhounds, Dogs or Bitches—Best, \$20; second, \$10; third, silver medal.
Class 11—Doberhounds, Dogs or Bitches—Best, \$20; second, \$10; third, silver medal.
Class 12—Champion Pointers, over 50 lbs.—Dogs—See Regulation No. IX—Best, \$60.
Class 13—Champion Pointers, over 50 lbs.—Dogs—See Regulation No. IX—Best, \$60.
Class 14—Pointers, over 50 lbs.—Dogs—Best, \$50; second, \$25; third, \$15.
Class 15—Pointers, over 50 lbs.—Bitches—Best, \$50; second, \$25; third, \$15.
Class 16—Champion Pointers, under 50 lbs.—Dogs—See Regulation No. IX—Best, \$60.
Class 17—Champion Pointers, under 50 lbs.—Bitches—See Regulation No. IX—Best, \$60.
Class 18—Pointers, under 50 lbs.—Dogs—Best, \$50; second, \$25; third, \$15.
Class 19—Pointers, under 50 lbs.—Bitches—Best, \$50; second, \$25; third, \$15.
Class 20—Pointer Puppies, over 6 and under 12 months old—Dogs—Best, \$15; second, silver medal.
Class 21—Pointer Puppies, over 6 and under 12 months old—Bitches—Best, \$15; second, silver medal.
Class 22—Pointer Puppies, under 6 months—Dogs—Best, \$10; second, silver medal.
Class 23—Pointer Puppies, under 6 months—Bitches—Best, \$10; second, silver medal.
Class 24—Champion English Setters—Dogs—See Regulation No. IX—Best, \$60.
Class 25—Champion English Setters—Bitches—See Regulation No. IX—Best, \$60.
Class 26—English Setters—Dogs—Best, \$50; second, \$25; third, \$15.
Class 27—English Setters—Bitches—Best, \$50; second, \$25; third, \$15.
Class 28—English Setter Puppies, over 6 months—Dogs—Best, \$15; second, silver medal.
Class 29—English Setter Puppies, over 6 months—Bitches—Best, \$15; second, silver medal.
Class 30—English Setter Puppies, under 6 months—Dogs—Best, \$10; second, silver medal.
Class 31—English Setter Puppies, under 6 months—Bitches—Best, \$10; second, silver medal.
Class 32—White markings will not debar dogs from being entered in Classes 32 to 39—Champion Black and Tan Setters—Dogs—See Regulation No. IX—Best, \$60.
Class 33—Champion Black and Tan Setters—Bitches—See Regulation No. IX—Best, \$60.
Class 34—Black and Tan Setters—Dogs—Best, \$50; second, \$25; third, \$15.
Class 35—Black and Tan Setters—Bitches—Best, \$50; second, \$25; third, \$15.
Class 36—Black and Tan Setter Puppies, over 6 months—Dogs—Best, \$15; second, silver medal.
Class 37—Black and Tan Setter Puppies, over 6 months—Bitches—Best, \$15; second, silver medal.
Class 38—Black and Tan Setter Puppies, under 6 months—Dogs—Best, \$10; second, silver medal.

Class 39—Black and Tan or Setter Puppies, under 6 months—Bitches—Best, \$10; second, silver medal.
 Class 40—Champion Red or Red and White Setters—Dogs—See Regulation No. IX—Best, \$60.
 Class 41—Champion Red or Red and White Setters—Bitches—See Regulation No. IX—Best, \$60.
 Class 42—Red or Red and White Setters—Dogs—Best, \$50; second, \$25; third, \$15.
 Class 43—Red or Red and White Setters—Bitches—Best, \$50; second, \$25; third, \$15.
 Class 44—Red or Red and White Setter Puppies, over 6 months—Dogs—Best, \$15; second, silver medal.
 Class 45—Red or Red and White Setter Puppies, over 6 months—Bitches—Best, \$15; second, silver medal.
 Class 46—Red or Red and White Setter Puppies, under 6 months—Dogs—Best, \$10; second, silver medal.
 Class 47—Red or Red and White Setter Puppies, under 6 months—Bitches—Best, \$10; second, silver medal.
 Class 48—Chesapeake Bay Dogs—Best, \$20; second, \$10.
 Class 49—Chesapeake Bay Bitches—Best, \$20; second, \$10.
 Class 50—Irish Water Spaniels—Dogs—Best, \$20; second, \$10; third, silver medal.
 Class 51—Irish Water Spaniels—Bitches—Best, \$20; second, \$10; third, silver medal.
 Class 52—Retrieving Spaniels, other than pure Irish—Dogs—Best, \$20; second, silver medal.
 Class 53—Retrieving Spaniels, other than pure Irish—Bitches—Best, \$20; second, silver medal.
 Class 54—Clumber Spaniels—Dogs or Bitches—Best, \$20; second, \$10; third, silver medal.
 Class 55—Cocker Spaniels—Dogs—Best, \$20; second, \$10; third, silver medal.
 Class 56—Cocker Spaniels—Bitches—Best, \$20; second, \$10; third, silver medal.
 Class 57—Cocker Spaniels, Puppies, Dogs or Bitches—Best, \$10; second, silver medal.
 Class 58—Field Spaniels, not otherwise mentioned—Dogs—Best, \$20; second, silver medal.
 Class 59—Field Spaniels, not otherwise mentioned—Bitches—Best, \$20; second, silver medal.
 Class 60—Foxhounds, Dogs or Bitches—Best couple, \$25; second, \$10; third, silver medal.
 Class 61—Harriers, Dogs or Bitches—Best couple, \$20; second, \$10.
 Class 62—Beagle, Dog or Bitches—Best, \$20; second, \$15; third, silver medal.
 Class 63—Dachshund—Dogs—Best, \$20; second, \$10; third, silver medal.
 Class 64—Dachshund—Bitches—Best, \$20; second, \$10; third, silver medal.
 Class 65—Fox Terriers—Dogs—Best, \$20; second, \$10; third, silver medal.
 Class 66—Fox Terriers—Bitches—Best, \$20; second, \$10; third, silver medal.
 Class 67—Fox Terrier Puppies—Dogs—Best, \$10; second, silver medal.
 Class 68—Fox Terrier Puppies—Bitches—Best, \$10; second, silver medal.
 Class 69—Collies—Dogs—Best, \$15; second, \$10; third, silver medal.
 Class 70—Collies—Bitches—Best, \$15; second, \$10; third, silver medal.
 Class 71—Collie Puppies—Dog or Bitch—Best, \$10; second, silver medal.
 Class 72—Dalmatian or Coach Dogs or Bitches—Best, \$15; second, silver medal.
 Class 73—Bull Dogs or Bitches—Best, \$20; second, \$10; third, silver medal.
 Class 74—Bull Terriers, Dogs or Bitches—Best, \$20; second, \$10; third, silver medal.
 Class 75—Bull Terrier Puppies, Dogs or Bitches—Best, \$10; second, silver medal.
 Class 76—Skye Terriers—Dogs—Best, \$20; second, silver medal.
 Class 77—Skye Terriers—Bitches—Best, \$20; second, silver medal.
 Class 78—Pugs—Dogs—Best, \$20; second, \$10; third, silver medal.
 Class 79—Pugs—Bitches—Best, \$20; second, \$10; third, silver medal.
 Class 80—Pug Puppies, Dogs or Bitches—Best, \$10; second, silver medal.
 Class 81—Scotch Terriers, Dogs or Bitches—Best, \$15; second, silver medal.
 Class 82—Black and Tan Terriers, Dogs or Bitches—Best, \$15; second, silver medal.
 Class 83—Dandy Dinmont Terriers, Dogs or Bitches—Best, \$15; second, silver medal.
 Class 84—Yorkshire Terriers, blue and tan, over 5 lbs, Dog or Bitch—Best, \$20; second, \$10; third, silver medal.
 Class 85—Yorkshire Terriers, blue and tan, not exceeding 5 lbs, Dog or Bitch—Best, \$20; second, \$10; third, silver medal.
 Class 86—Toy Terriers, other than Yorkshire, blue and tan terriers, Dogs or Bitches—Best, \$15; second, silver medal.
 Class 87—Blenheim Spaniels, Dogs or Bitches—Best, \$15; second, silver medal.
 Class 88—King Charles Spaniels, Dogs or Bitches—Best, \$15; second, silver medal.
 Class 89—Japanese Spaniels, Dogs and Bitches—Best, \$10; second, silver medal.
 Class 90—Italian Greyhounds, Dogs or Bitches—Best, \$15; second, silver medal.

Owing to a want of space, the managers can only receive 940 dogs, and the entries will close as soon as the above number is completed. As this rule will positively be enforced, exhibitors are requested to send in their entries at the earliest possible moment.

—Mr. Chas. Lincoln, Supt. of the coming New York Dog Show at Gilmore's Garden, in May, informs us that his headquarters during the exhibition will be at the Ashland House, on Fourth Avenue, which is within three blocks of the Garden. The Ashland is one of those good houses that are deserving, and the rates are very reasonable, either on the European plan or *table d'hôte*, and the proprietor is a genial sportsman.

IN REGARD TO BENCH SHOWS.—*Editor Forest and Stream:* The Boston Bench Show of Dogs suggests several matters that are of considerable importance to all breeders of thoroughbred dogs. First comes this question, "How shall the classes be divided in future bench shows?" Have we any right to claim a separate class for native setters or pointers? If we have separate classes for native dogs, is it not a tacit acknowledgment that our pointers and setters are inferior to English pointers or setters? If this is the case, which I for one do not believe, it is high time that we should know just where we stand, and the only way to improve our dogs is to put them in direct competition with other and better dogs of the same breed. If our dogs are equal, or even better, than imported dogs, then there is no reason for any native class, and the sooner it is abolished in all American Bench Shows the better. Let us at once throw down the gauntlet to all the world, and enter our best dogs against the best any other country can produce. By careful breeding of short-borns in this State, it is well-known that English buyers have given enormous prices for stock to go back to the country from which they were originally brought, and this is what will

happen before many years are over in regard to sporting dogs. There are many breeders like Mr. Smith, of Strathroy; Mr. Godeffroy, of Guymerd; Mr. Tilly, of Long Island, to say nothing of the various kennel clubs who are making a specialty of setters and pointers, taking every care in selecting the best bitches to breed from, and buying the best native or imported stud dogs. This can have but one result, and that is to produce a class of dogs that are fit to compete for any prize either here or in Europe. Under such circumstances, where is the use then of a native class? There is another matter of minor importance suggested by the Boston show, which would tend very much to increase the interest not only of exhibitors but the outside public, and that is, that during judging, the number of the class being judged should be displayed in a conspicuous manner, and the winners announced in the same way; similar, indeed, to the number of the winning horses at a race-course. This would not only give exhibitors a chance to have their dogs ready for the next class to be judged, but would tend to concentrate the interest of all the visitors on the winning dogs. I would conclude by saying that from experience at the New York and Boston Bench Shows, I would suggest that some other food be supplied for the dogs, as dog biscuits, for those dogs that are not accustomed to them, have the effect of scouring altogether too much. Yours respectfully,
 JOHN E. J. GRAINGER.
 New York, March 29, 1878.

ART AT THE BOSTON BENCH SHOW.—We gave in our last issue but a few words in regard to the really fine collection of pictures which graced the walls of the building in which the Massachusetts Kennel Club held their exhibition. Mr. Walter M. Brackett, who as an artist in fish, has really no equal either at home or abroad, exhibited there his wonderful series of pictures, "The Rise," "The Leap," "The Last Struggle," and "Landed." These four companion pictures are as a poem, the epic, in fact, of the most beautiful of all fish. There is the dash, the boldness of the gamest of fish, as he takes the lure, the swift plunge, the lightning dash of the salmon as he is struck, and, lastly, the quiet repose of the king of fish, as, lustrous like frosted silver with the gleams of the opal, he lies passive on the shore. There are many things to be considered in pictures of this character. Your artist may, if he pleases, portray his subject, as a dead salmon lying recumbent in the fish-dealers' stand, and it may be a good work of still art, but to Mr. Brackett the credit belongs of having caught with his pencil those various phases of life and action in fish with which the angler is so cognizant. Of course, Mr. Brackett is well known for his prowess as a salmon fisherman, or how otherwise could he have drawn and colored these fish? How often must the artist have had printed in his brain the exact similitude of how a salmon leaped for the fly, or how, when he had the hook, with a whirl and plunge, as fast as a rifle shot, as swift as an eagle, he flew with whirling line and rattling reel from the deep pool away down the stream below. We often have endeavored to explain what difference there must necessarily exist in the appreciation of such works of art. Your ichthyologist wants exactly so many spines in dorsal, and if he cannot count them he is not satisfied. But it is the better cognizance of what is natural, idealized by art, which gives the only perfect illusion. Just such capital traits does Mr. Brackett possess. A visit to this artist's atelier was a source of great pleasure to us. Here were studies of salmon and trout from far distant streams in Maine or the provinces, which were perfect in drawing and color. The impressions made on visitors when they see such pictures vary so much. Your Philistine connoisseur, when he looks at a fine salmon has his digestive organs mostly called into play. "How a slice of such a fellow would taste—say, cooked with green peas." To another of a less physical temperament, it brings the thought of rushing waters, of dripping rocks, of shady forests, fragrant with resinous odors, and the excitement of the long cast, and then the silver ingot, which, like a bolt, springs upward from the dark, silent pool. In the collection were also exhibited two pictures of Mr. A. L. Brackett, a woodcock and partridge, which, for color of plumage and that peculiar fluffiness of feather, were very excellent. There are numerous painters of dogs in Boston, whose works should be better appreciated in New York. Mr. T. Hinckley, Mr. W. J. Hays and Mr. F. W. Rogers had numerous pictures of dogs of great merit. A study of two setters by Mr. Rogers is a vigorous bit of work, and was especially admired by many exhibitors. Mr. Gaston Fay's "Bull-Dozer" was a clever production of this well-known illustrator.

DISCRIMINATION IN SCENT.—There seems to be little doubt that by the sense of smell alone the dog exercises the faculty of discrimination for which in man that of sight is needed. Who that has hunted much over pointer or setter broken to retrieve has not frequently enjoyed the pleasure of seeing the live bird pointed by a dog, who, while on the point, still held the dead one in his mouth. With the effluvia of the latter streaming up his nostrils he yet detects the proximity of the former by the scent alone, and yet how similar must he the smell! Some may say the dog has pointed the living bird by sight, but I think not, for most retrievers will seize, or attempt to seize, a bird the moment it is visible. I have seen a dog draw on and point a heavy quail near the carcass of a dead horse when the stench for rods around was disgustingly offensive, and yet his nose enabled him to distinguish the presence of game. I was hunting once with two well-known physicians of this city, when one of them shot at and wounded a snipe. The dog went to retrieve it; it fluttered on a yard or two beyond him, and he was eagerly bent upon recovering it, when suddenly he turned and pointed a bevy of quail thirty feet distant, leaving the wounded snipe till he had flushed and fired into the former, when, of his own accord, he returned and retrieved it. Most sportsmen who have hunted several kinds of game over one dog and have become familiar with his style, can tell by his action and attitude what game is before him. I would like to hear, through the columns of your valuable paper, if you have not numerous correspondents who agree with me upon this subject.
 Charleston, S. C., April, 1878. J. H. H.

BEAR DOGS.—Our cognizance of what a bear dog is is that he is a mixed animal, with a good dash of hound and a predominance of bull dog. On the frontier where the offshoots of whites and Indians are found, such a breed of dog exists, made up possibly of a dozen different kinds of animal. They are fairly fast and have no end of courage, and some

three to six dogs are used in hunting bruin. Such dogs will go for a bear and fight him regardless of wounds. Now a correspondent of this paper wants some information about dogs proper for tracking bear. Will some of our friends in Maine or in the Provinces give us briefly what they know about bear dogs, and where one or two good ones may be had?

MISSISSIPPI DOG LAW.—A bill was passed in the Mississippi Legislature, at its last session, making it a felony to steal a dog. This may put a stop to the wholesale dog stealing formerly practiced.
 GUYON.

FOR DISTEMPER.—We are always glad to publish the experience of others in their treatment of sick dogs. The fumigation of tar and burnt feathers, mentioned by our correspondent, Mr. G. Lyman Appleton, Bryan Grove, Ga., we can ourselves endorse:

"My dogs—eight hounds, one pointer and a Gordon setter—have had distemper, and I not only have not lost a dog, but only one was seriously sick. I tried this receipt with the above result: When dog is first taken, give one pod of red pepper; this is all. Six of the dogs were young, and I am satisfied from past experience that had it not been for the pepper I should have lost some of them. In two of the worst cases I smoked the dogs with tar and feathers to stimulate discharge from the nose; the others did not require it. Every dog was well in two weeks from attack, coat bright and discharge gone, also cough. I gave the pepper as I would a pill; common red pepper, pod dried. I hope some one will try this and see how it works. I have lost several dogs by distemper, and had one lose all use of one hind-leg, and used many remedies, but was sure of none until now."

THE MUIRKIRK KENNEL.—The following named dogs belong to the Muirkirk (Maryland) Kennel.—[See advertisement.]

"Ponto, four years, liver, got by Milo, dam Juno; Bragg, lemon and white, own brother to Tell, winner of first premium for native pointers, at New York, May, 1877; Dash, liver and white, whelped Aug., 1877, got by Ponto, out of Ginger; Boh, four years, liver, got by Don, out of Meg. Bitches—Ginger, four years, liver, got by Don, out of Meg; Kate, lemon ticked, one year old, got by Sensation, out of A. Dodge's liver bitch, Dolly; Meg, black, six months old, got by Captain Nicholson's Meg, out of Allen Dodge's Dolly. Ginger whelped, April 1, 1878, nine pups, four liver dogs, one liver and white dog, and four liver bitches."

FOX HUNTING.—Columbia, Tenn., March 30.—S. M. Matthews and several other gentlemen started a large red fox at dark last night with ten hounds. They kept up the chase all night. Reynolds finally gave them the slip by swimming the river; two dogs followed but soon returned.
 VAL.

MARYLAND FOX CHASING.—The members of the Elkridge Fox Hunting Club and their invited guests, a party of thirty, had a most exciting run in Anne Arundel County, last Saturday.
 THAYMOOR.

—Edward Lohman, of New York, claims the names of Erwin and Quail III. for dog and bitch puppies out of his imported Irish setter bitch, Quail II., by Redgauntlet.

VERY GOOD DOGS FOR SALE.—We call particular attention to an advertisement of the Westminster Kennel Club. This leading kennel, being desirous of making a draft, will sell some of the choicest of their pointer stock. The progeny of so well known a dog as Sensation with Whiskey for dam, ought to be in demand. Any one wishing a dog for the field or to breed ought not to overlook this chance.

A VERY GOOD POINTER.—Mr. E. S. Wadmaker, of Pascack, N. J., the well known breeder, has a remarkably fine pointer puppy, which he offers for sale. As the pedigree of the dog is well known, we should suppose it would find a ready purchaser.

CARD.

The letters received at this office addressed to "T. W. S." in reply to advertisement offering Stafford for sale, have been to it. If the writers will duplicate their letters they will be promptly attended to. Address "T. W. S., this office."

Game Bag and Gun.

GAME IN SEASON IN APRIL.

Wild ducks, geese, brant, etc.

GAME IN MARKET—RETAIL PRICES, POULTRY AND GAME—Game—Canvas back duck, per pair, \$1.25; red head ducks, \$1.00; brant geese, \$1.25; mallard ducks, 75 cents; black ducks, 75; widgeon ducks, 40; broad bill ducks, 50; teal ducks, 40; Wilson snipe, per doz., \$1.50; plover, \$1.50; bay birds, large and small, 75 cents; wild pigeons, flights, \$1.50; stall fed, \$2; Philadelphia squabs, \$3.00.

Poultry—Philadelphia and Bucks County dry picked chickens, per pound, 25 cents; do., fowls, 18; do., turkeys, 18; do., ducks, 20; do., geese, 15; State and Western chickens, 15; do., turkeys, 15; do., fowls, 12; do., ducks, 16; capons, 40; slips, 30; spring chickens, per pair, \$1.50 to \$2.00.

NEW HAMPSHIRE.—Warner, April 8.—For four days it has been cloudy and cool continually. March 14th—Saw purple finch; from 20th to April 1st, ducks, woodcock, pewee, fox sparrow and probably hermit thrushes in the woods, as they usually arrive early. April 1st—Cow birds; 5th, heard first frogs. A young collector brought in a very fine specimen of *Bonassa milberti*, and 18 do. *Brephos infans*. We accept these at least as harbingers of warmer days. *P. minor* is reported more than usually abundant, and is cutting antics on earth and in air. 7th—Grass finch.
 M. C. H.

WILD PIGEONS.—Great numbers of wild pigeons are being slaughtered in the vicinity of Petoskey, Mich.

—A Louisville, Kentucky, correspondent writes that a gentleman of that city (name not given, but undoubtedly the writer himself,) recently killed 66 pigeons out of 72 at double rises, missing only six. This is a most excellent score.

VIRGINIA CITY SHOOTING CLUB.—Quarterly meeting at Virginia City, Nev., March 31; 10 single, 5 double rises. First prize, gold medal and cartridge case; second, shooting coat; third, a dram flask. Score:

Gibson and Harrison tied again on four at 26 yards; shoot off at 31 yards won by Harrison.

New Publications.

We have received from T. B. Peterson & Bros., Philadelphia, "The Rival Belles, or Life in Washington," by J. B. Jones. **THE CADET BUTTON.**—A tale of American army life. By Brevet-Captain Frederick Whittaker. New York: Sheldon & Co. Price \$1.50.

The American army life of the frontier affords a field for fiction writers which has hitherto unfortunately been appropriated, almost exclusively, by the writers of flash literature. Finding their inspiration in the bottle, their materials in the escapades of red skin savages and equally savage pale faces they have surrounded frontier romance with the very repulsive atmosphere of powder, smoke and whisky fumes.

We had war novels. The heart of the nation was in that conflict. We followed imaginary heroes and heroines to the front, went with them through the perils of war and welcomed them back to home and peace as we had never followed characters of fiction before, because in the life there depicted was that of our own real heroes and heroines. But if we except the few short sketches of Miss Woolson and some of our other popular magaziologists there is nothing in current American literature which faithfully represents frontier army life as it is. For this reason, if for no other, we are glad that Captain Whittaker has selected this field for his work. His book aims to picture a higher type of garrison life than commonly finds its way into fiction and must, at least for this, meet the appreciation of the boys in blue.

The "Cadet Button," as those who are at all familiar with West Point must know, is suggestive of any amount of romantic incident, and with what truthfulness the author has depicted the varying fortunes of a soldier's life we must leave for the reader to determine.

The strategy of the Indian scouts in the closing chapters is very neatly conceived and outlined. May the author never find himself in as tight a place.

Promptly with the first of the month comes to us the *Naturalist*, with an unusually attractive list of articles. The *Naturalist* has always been warmly welcomed by us, and its recent increase in size causes a corresponding addition to the satisfaction felt on receiving it.

The April number opens with an article by Dr. T. M. Brewer, entitled "Changes in Our North American Fauna." In this paper, Dr. Brewer brings forward some evidence, showing that three species of birds, *Totanus ochropus*, *Larus canus* and *Egretta tricolor*, have undoubtedly been taken in North America, and thus deserve a place in our fauna; while *Podiceps cristatus* should be omitted from our lists, as there is no proof that a specimen has ever been taken on this continent, all the references seeming to be based on *Podiceps griseigena*. Mr. C. Hart Merriam, whose "Review of the Birds of Connecticut" has already been noticed in these columns, contributes some interesting "Remarks on Some of the Birds of Lewis County, Northern New York." This locality is one of unusual ornithological interest from the fact that here the Canadian and Algonquian faunas meet. Mr. Merriam's notes contain an unusual amount of new facts, and are to be continued. Mr. Brewster continues his "Descriptions of the First Plumage in Various Species of North American Birds," which are a most valuable addition to our knowledge and should be carefully studied by all collectors. In addition to the articles already mentioned we find in this number, "Notes on some of the Birds of Calaveras County, California, and Adjoining Localities," by Mr. Robert Ridgway; "Notes on the Breeding of Hutton's Vireo (*Vireo huttoni*) and the Gray Titmouse (*Lophophanes inornatus*), with a Description of Their Nests and Eggs," by William A. Cooper; "A Description of some Highly Developed Plumages of Birds of New York," by Mr. Edgar A. Mearns; "Notes on *Junco caniceps* and the Closely Allied Forms," by Dr. Brewer and others.

The recent literature in this number is especially interesting, and we would call particular attention to the translation of Dr. Louis Bureau's work, "On the Mouth of the Bill and Palpebral Ornaments in *Fregata aeterea* at the Close of the Breeding Season." The discoveries of this investigation are of the utmost importance. General Notes are as varied and interesting as usual.

No review can give an idea of the contents of the "Bulletin," which has become a necessity to any one who tries to keep up with the progress of ornithology.

—So much nonsense has been written and published concerning the relations existing between the prairie dog, burrowing owl and rattlesnake, that it is a pleasure to call attention to an accurate and matter-of-fact article on this topic. Such an article, from the pen of Mr. S. W. Williston, appears in the last number of the *American Naturalist*. In it the writer gives the result of several years' experience in the West, and contributes a very competent resume of interesting facts. "The Transformation and Rabbits at the Elsie Beetle (with a plate)," by Prof. C. V. Riley, is an interesting account of a group of insects whose earlier stages of development have been, until recently, quite unknown. It is an extremely valuable contribution to our knowledge of entomology. Other articles in this month's *Naturalist* are, "Traces of Solar Worship in North America," by Edwin A. Barbour; "Rambles of a Botanist in New Mexico," by Edward Lee Greene; "Amorpha Tretena," by Dr. Joseph Eldy, and several others.

Recent literature and General Notes contain much that is attractive; in the latter we have a note on the "Nesting of the English Sparrow," "The Occurrence of *Besaria antuta* in Oregon," "Notes of Two New Genera of Fresh-water Fishes from North America," and other items of interest.

RANDOM CASTS.—Odds and ends from an angler's notebook. Derby Brothers, 21 Park Place. Price 50 cents. A pleasant sketch of 116 pages, written in a pleasant gossip style, evidently to beguile a leisure hour. Will be read with pleasure by the author's immediate party and personal friends.

WALLACE'S ADIRONDACK GUIDE.—A new edition of this valued book is announced as forthcoming, the old edition being nearly exhausted. We have two dozen on hand which we will dispose of at reduction. Price \$1.60 with complete map of the wilderness.

NEW YORK POST-OFFICE GUIDE.—Strangers who visited the New York Post Office April 1, were all directed to a room on one of the upper floors, known in Post Office parlance as "Eden," and the young ladies there employed held an unwilling April-fools' levee all day. No such gulling could have been perpetrated had the visitor been armed with one of the very complete and perfect Post Office Guides published by Gustav Lauer, 64 Ann St.

THE ROCKY MOUNTAIN TOURIST.—We have received from Mr. W. F. White, Gen. Pass. and Ticket Agt. A. T. and St. F. R. R., Topeka, Kan., a copy of the new "Rocky Mountain Tourist." This is a work of sixty-four pages, full of all practical information and entertaining reading. There are sixteen of Thomas Moran's exquisite drawings, among them his famous reproduction of the Mount of the Holy Cross, his drawings of Grand, Glen, Marble, Knab and Bonnier Canyons, Twin Lakes, Teocalli Mountain, etc. Joseph Beard is represented by characteristic hunting sketches, Blasing by several exceedingly attractive mountain sketches, Lancelot by spirited drawings of the remarkable rock-sculpture on White River, and Henry Worrall by full-page views at Vela Pass and Wagon Wheel Gap, as well as a large number of other very finely executed sketches in different portions of the Western country. Mr. White sends these beautiful books free to all who apply to him for them. We don't understand why he does this, or how he does it, but he does. Send for one.

Natural Pastimes.

NEW YORK ATHLETIC CLUB.—At the opening handicap games of the season, at the club grounds last Saturday, the first trial heat of the 100 yards race was won by H. Inman in 10 seconds; the second by W. C. Wilmer in 10 1/2 seconds; the third by J. M. Delaney in 10 3/4 seconds; the fourth by G. P. Work in 10 1/2 seconds, and the fifth by R. La Montagne; the final heat, G. M. Delaney and G. P. Work came in together, R. La Montagne second. Next was a one-mile walk, with seventeen entries, which was won by H. A. Cohen, of the Manhattan Club. After this was a half-mile run, with eighteen starters. It was won easily by W. R. Whitmore, of the New York Club, in 2m. 16s.

—In a game of Lacrosse between the Ravenswood and New York Clubs, two goals were won by the latter.

NEW YORK RIDING CLUB.—The fifth anniversary of the New York Riding Club was celebrated by a very pleasant exhibition of equestrian skill at Dockrill's Riding Academy. The riders were: Mr. N. Storck, Director; Messrs. A. Bender, P. C. and O. Knauth, A. Schwab, Charles F. Becker, E. Werner, G. F. Eisenmann, E. Kaepfel, A. Schmeisser, A. F. Miller, J. Simon, J. T. Williams and Geo. C. Clauseu. The feats were, many of them, difficult, and the exhibition highly creditable to the horsemen.

RACKETS.—Three games of American Rackets were played in Hoboken, March 30, between Oscar Manning, of Philadelphia, and T. B. Meisler and William Punch. The first two games were won by Manning. Score, 21 to 7 and 21 to 12. The third was won by his opponents. Score, 21 to 20.

—The championship games of the New York Racket Club have been postponed to the 15th inst. The contest will begin with games between Mr. O. Adams and Mr. Fred May; Mr. J. C. Allen and Mr. D. Lydig; Mr. J. T. Souther and Mr. E. Lamontagne, and Mr. G. T. Dixon and Mr. R. S. Thorp.

AMATEUR RACING.—A race of 100 yards was run at the New York Athletic Club's grounds between M. La Montagne and E. J. Wendell for a silver cup. M. La Montagne had three yards start. Wendell won by two yards in 11 1/4s. M. La Montagne, W. Stebbins and S. Burton had a spin of 100 yards. The former won in 13s.

HARRY HILL'S "UNKNOWN."—The man whom Harry Hill thinks can beat O'Leary's time is John Hughes. He is to walk, at Central Park Garden, a time match, to make more than 520 miles in six days.

O'LEARY'S BELT.—O'Leary is to bring his belt to America, and if any one wants it they must come over here and get it. The prizes in the late match have been distributed. O'Leary received \$3,750, Vaughan, \$1,300, and Brown \$525. The other contestants got various smaller sums.

—Professor Stover, of St. Albans, Vt., completed 102 miles in 20h. 42m. 1s, April 3.

"TRAMP, TRAMP."—A ten-mile walking match came off at the Fifth Regiment armory, Baltimore, between members of that regiment, April 2. They finished as follows: Edward Bell, of the drum corps, 2h. 30s.; Taylor Gregg, private Co. C, 2h. 10m. 30s.; Lee Goldsborough, 2h. 18m. 30s.; E. Pennington, 2h. 19m. 20s.; Charles McPherson, Co. B, 2h. 21m. 12s.; Weston Lilley, 2h. 27m.; Joseph Fifer, Co. B, 2h. 28m.; Edward Henry, Co. B, 2h. 28m. 30s.; and Charles Bradenbaugh, Co. C, 2h. 34m. 30s.

ST. GEORGE'S CRICKET CLUB.—The club uniform consists of white pants, red and white jackets and red and white caps.

ANOTHER CHAMPIONSHIP WALK.—A thirty-six hours' contest for the long-distance walking championship of America will begin at the American Institute, N. Y., May 10 and 11. The prizes, a magnificent championship belt and \$400, which will be divided between the first second and third men. The winner of the belt will hold the trophy subject to challenge.

—John Haydock finished his walk of 100 continuous hours at Nassau Hall, Boston, last Saturday, and then fainted.

EMPIRE GYMNASIUM AND ATHLETIC CLUB.—This is a newly organized association, which will have for its headquarters the gymnasium in Thirty-fourth street, formerly occupied by the Police Athletic Club.

PENINSULA CRICKET CLUB.—The officers of the Peninsula Cricket Club, of Detroit, Mich., for the ensuing year are: Pres., George E. Hland; Vice-Pres., R. B. Ridgley; Sec. and Treas., C. B. Calvert; Managing Com., Joseph Taylor, H. G. Habbie, E. C. Borrowman, J. McLoughlin, C. R. Calvert, F. C. Irvine, F. Bamford; Match Com., J. W. Waterman, William Milward, William White.

COACHING.—The Coaching Club will drive, May 4, from this city to Philadelphia, a distance of 95 miles, which will be made in 10 hours and 45 minutes, with nine changes of horses.

NATIONAL BASE BALL LEAGUE.—The following schedule was adopted at the meeting of the League, held at Buffalo, April 1: "Chicago opens at the Indianapolis grounds and Milwaukee at the Cincinnati grounds, both on May 1; Cin-

cinnati opens at Milwaukee, and Indianapolis at Chicago, both on May 14; Boston opens at Providence May 1, and Providence at Boston May 4. The Western clubs play three games all round before going East. Chicago and Milwaukee go East together, followed by Cincinnati and Indianapolis.

Answers to Correspondents.

No Notice Taken of Anonymous Communications.

A number of anonymous correspondents will understand why their queries are not answered, when they read the lines at the head of this column.

L. G., Pittsburgh, Pa.—No law for crow-blackbirds.

B. P., Pittston.—Copy of Catalogue and form of black entry sent you.

H. W. C., Attleboro.—For chilled shot mortis see previous issues of this paper.

F. C., Cleveland.—May is a close season for game. Bears and cats may be shot then, though.

H. H. A., Westminster Hotel.—We send you catalogue and blank. It contains full information.

J. W., Boston.—The price of the Orvis perforated reel is \$5. Other German silver reels vary from \$1 to \$10.

SRMS, Germantown.—For good snipe shooting go and inquire of John Kridler, Walnut and Second streets, Phila.

G. H. W., Titusville.—For glass eyes for natural history specimens write to Wallace, 19 North William street, N. Y.

G. H. T., Albany.—The auxiliary barrel is made precisely of the same material, and worked the same as the Winchester rifle barrels.

G. C. W., Canada.—We never guarantee the character of goods advertised by us, but the firm publishing the prints stands very high.

F. P. H., Syracuse.—For guide to New York write to Chas. J. Dillingham, 678 Broadway. Price, 50c. We can send you a map of the city.

M. A. S., Louisville.—Is there any such maker as — in Birmingham, England, or is it a fictitious name? Ans. Yes, and a celebrated one.

T. W. F., Rochester.—The killing of woodcock and other migratory birds by unwittingly flying against telegraph wires is of common occurrence.

G. McF., Long Branch.—Is there any way to prevent a cedar fishing boat from checking by the wind and sun? Ans. Would advise a coat of boiled linseed oil.

QUESTIONERS, Phila.—You will find Staunton, Augusta Co., Va., a good initial point for your fishing and hunting expedition. Write to Capt. W. L. Bumgardner, at Staunton.

T. H. M., Crown Point, N. Y.—What can I do for my English foxhound? He froze his foot last January and it does not get well. Ans. Wash regularly in strong salt and water.

C. E. W., Troy, N. Y.—When does season for wild doves open in Virginia? Ans. If by wild doves you mean wild pigeons there is no provision for them in the game laws of Virginia.

J. W., Pittsburgh, Pa.—What is the best time to go fishing for general fishing and gleaning on the Jersey shore? Is August, or September a good time? Ans. August and September are excellent.

R. O., Hackettstown, N. J.—Will the Remington revolving rifle take extra long 35 cal. copper cartridges? I have been using the "long," but would use the "extra" if the cylinder will take them. Ans. Yes, perfectly well.

Trek, Portland.—Will you please give name and price of best works on rifle shooting? I have Wingate's Manual. Ans. We know of nothing better and can advise you of no other sound work. Will be very glad to hear from you.

D. N. A., Fulton, Ill.—Is the — a gun that you would recommend to a purchaser? Is the manipulation as good as other makers? Ans. Excellent gun every way and has some peculiarities of breech-movement which we think very highly of.

Rocky, Animos City, Col.—Where and at what price can I get Prof. Hayden's reports on ornithology and fur-bearing animals? Ans. Apply to F. V. Hayden, U. S. Geographical Survey, Washington, D. C., or to Dr. Elliott Coues, same address.

ONTARIO, New York.—For snipe go to the Big Piece, N. J. See our game column this number. For ducks keep watch of our game reports from week to week. For glass ball shooting go to the Jersey City Heights Gun Club grounds, at Marion, N. J.

S. W. P., St. Louis.—Have a 10 bore breech-loading gun, 22 inch barrel pistol grip, London, five twist, marked —. Are any of — guns so marked? Ans. Yes, but the single name, though made by the firm indicates that it is not their highest grade.

C. M., Otsego Lake, Mich.—1. Can you inform me if the two-handed U. S. Springfield needle gun 50 cal, 70 grs. is now used by the U. S. regular army? 2. Do you know who keeps such guns for sale and price? Ans. 1. Yes. 2. Messrs. Remington & Son have them. Price, \$16.

G. J. B., Volcano, W. Va.—Englehardt's "American Rowing Almanac and Oarsman's Companion" contains a concise treatise on training, besides other matter of interest to you. Waters, Balch & Co. issued a more expensive work in 1871. Price \$5.50. Can procure either for you.

TAXIDERMIST, Lebanon, N. H.—Where can I send to get specimens of Canada geese, snow geese and brant in suitable condition for stuffing? I refer to the dead bird, not the dry skin. Ans. Better send to Robbins & Co., Fulton market, New York, or to some dealer in Faneuil market, Boston.

H. W., Georgetown, D. C.—How far from the muzzle of choke-bores does the choke begin? How far modified choke? Ans. Could not give an understandable explanation, as all makers vary so much. It may commence three to five inches from muzzle, or only in the last 1 1/2 to 2 1/2 of an inch.

D., Concord.—1. I have a \$65 breech-loading Remington shot-gun, weight 8 lbs. 14 ozs., 12 bore, barrels 30 inches. Tell me the best load for ordinary shooting and duck shooting? Ans. 1. For ordinary up-land shooting 3 1/2 dra. powder, 1 1/2 oz. shot; for ducks, 4 dra. powder, 1 1/2 oz. shot.

J. B. H.—Please inform me through your paper when weekfish and bass begin to run around New York, Newark Bay and New York Bay? Ans. The best season for weekfish is from middle of June until first of September; striped bass, June first to end of October; sea bass, all summer and early fall.

J. D. M., Ovid, Mich. 1. Will you forward the address of some dealer in taxidermist's supplies? 2. Would Texas be a good locality for a first-class gunsmith to open a shop, one who is used to fine work on breech-loading guns? Ans. 1. A. B. Chert, box 237, Ann Arbor, Michigan; A. M. Decker, 113 Third st., Chicago. 2. Texas offers an excellent opening for a good gunsmith.

W. T., Philadelphia.—My setter dog, 10 months old, never had distemper. As I hunt him he gets wet. When he comes home he seems drowsy. He seems to be passing blood, and strains a good deal. Ans. Give him small doses of castor oil and tannin; a teaspoonful of the former, and 20 drops of the latter.

A. J. J., N. Y.—1. Do you know of any shooting and fishing at Lake Hopatcong in New Jersey, if so what kinds and how is it? 2. Is a dog by a red Irish out of a Gordon a good dog? Ans. 1. Pickerel, perch and salmon trout are found there. We have had no advice of the sport there this spring. 2. Yes; it will make good a cross.

St. Louis, Mo.—One of our customers in Nebraska writes us that he wants the best book to be had on bass and salmon fishing. Could you give us any information on the subject and give price of such a work? Ans. "Hallow's Sportsman's Gazetteer," 900 pp. Price \$3. One hundred and eleven pages devoted to fishes.

St. Louis, Mo.—Will you please give me the address of responsible parties who have yearling trout for sale? What time does the law allow us to angle for black bass in New York State? Ans. H. P. DeGraff, President of the Bowery Bank, will furnish you all the yearlings you want. Black bass fishing allowed May 20.

F. H. S., Rochester.—Dixon Kemp's English work on yacht designing gives ample information in sails, their cut, etc.; price \$25. "The Yacht Sailing," by Vanderdecken, price \$1.75; "Yachts and Yachting," by the same author, price \$10.50, and "The Sailing Boat," by Falkner, price \$3.50, are all useful books on sailing and managing a yacht.

T. C. H., Philadelphia.—1. I have a setter pup about 4 months old; at what age should I have him broken? 2. Have also taken a piece of tail and it does not seem to heal, what should I put on it? Ans. 1. Summer woodcock and fall shooting will be the time for him. 2. The tail will heal in time if properly cut, if not cut it again properly.

Toi SNAP, Byron, Mass.—1. Please state how the numbers of Curtis & Harvey's powder run in regard to size? For instance, is No. 1 the largest or smallest grain? 2. What would be the right size grain of the above in use in a 10 gauge 32 inch breech-loader? Ans. 1. No. 1 is the finest. The numbers increase in size. 2. Either No. 6 or No. 7. Prefer 7.

W. P. A., Fagundes, Forest Co., Pa.—Do you know of any one that would like to have a pet bear? Is about one year old, weight about 150 pounds; is tame as a kitten, and about as playful. I will take no less than \$25, delivered at Truckeeville Station. Ans. An advertisement costing \$1 will probably bring a customer. By-laws for rifle club sent as requested.

Dexter, Albany.—In your "Gazetteer" you say that an able authority will soon give his opinion on the difference in the black and cinnamon bears, or rather that they are identical. Has he done so? Who is it? Ans. The authority referred to is Dr. Elliott Cones, whose "History of North American Mammals" is in progress. He has not yet treated the bear family.

Thicks, Sandy Spring, Md.—For Jackass-rabbit address W. F. Carver, Cheyenne, Wyoming Ter. He deals in wild animals, or did recently. Also, address Chas. E. Aiken, Colorado Springs, and J. P. Lower, Denver, Col. English rabbits are no good for coursing; they are burrowers, and not runners; their habits are much like those of our domestic rabbits.

MILLER, Milford, Wis.—What is first-class pattern for 10 gauge, 10 lb. gun, cylinder, medium choke, or full choke, 4 1/2 drs. powder, 1 1/2 oz. Tatham's soft shot, 40 yds., 30 in. circle, of Nos. 2, 4, 6, 7 and 8? Ans. For cylinder—No. 2, 42 pellets; No. 4, 60; No. 6, 101; No. 7, 139; No. 8, 157. For medium choke, one-half of counted shot; for full choke, two-thirds of counted shot.

M., High Point, N. Carolina.—I have a setter who for the last three days has acted unwell. Drooping saliva from the mouth, which he holds half open as though it hurt him to close it; eyes rather red and inflamed, and drowsy actions. He is an old dog passed distemper. Ans. Chain up your dog at once. Await further developments. Rabies may commence in way you describe.

R. A. C., Rockland, Maine.—I have a Gordon setter pup 13 months old. She was in heat in December and was kept in close confinement during the time. I see that her teeth have milk in them now, they are not very large. Can you explain this? Some say that she ought to be milked. Ought this to be done? Ans. The case is not an unusual one. She ought to be left alone.

C. F. M., Newark.—1. Which is the best part of Kansas for agriculture? 2. What kind of game will I find? 3. What can land be bought for? 4. What is the cheapest gun made by —, and is it a reliable gun? Ans. 1. For full particulars of Kansas farming lands write to J. D. Brown, Gen. Pass. Agt., M. K. and T. R. R., St. Louis, Mo. 2. Deer, turkeys, ducks, grouse, etc. 3. Fifty dollars, and very reliable.

C. L. S., New Haven, Conn.—While hunting grouse in the latter part of Dec. and first of Jan., although we had a good dog, he could do nothing because the grouse could not be persuaded to come from the trees. Is not this something unusual, especially in a place well hunted? Ans. In wet or threatening weather we have often known grouse to remain in the trees throughout the day. But does our correspondent shoot grouse in January?

H. C., Baltimore.—West Indian and other woods for fishing rods are usually sent to this city on consignment and find sale among the leading rod makers. You may be able to obtain small lots from the latter. The leading makers are J. B. Crook, Conroy, Bissett & Malleon, Fulton street, and Abbey & Imbrie, Maiden Lane. Cork floats are made from the root of the cottonwood tree. Mr. Terhune, to whom we referred you, we find has gone out of the business.

F. L. C., of Hone's Point Club.—I must be in Nelville, Clark Co., Wis., third Monday in April to attend Circuit Court, and would like to know the best and most likely hunting for shot-gun or rifle? Ans. There is no legitimate shooting in April, except ducks and migratory fowl. As there are plenty of bears and cats, would advise taking a Winchester repeating rifle. Plenty of bass and pickerel in interior waters, with trout in the northern part of the State.

WASBON SHOOTING CLUB, Ohio.—1. In off-hand shooting is it proper for the shooter to rest his elbow against any part of his body? 2. A ball strikes the circle between 4 and 5, Creedmoor, so that it cannot be determined that there is any more in the one than in the other circle; what does that count? Ans. 1. There is no objection to the elbow resting against the body, provided the little finger of the left hand is in front of the trigger-guard. 2. It counts to the higher score, and is a 5. We take great pleasure in sending you rules, etc.

C. P. C., Jr.—1. In cleaning a gun, when you have oiled it thoroughly, should you go over it again, and with a dry rag rub the oil off? 2. Are precautions necessary in mixing Dittmar powder with black? 3.

What is the best mixture in regard to pattern and penetration for the Dittmar and black powders? Ans. 1. Always rub down with a soft rag after cleaning. 2. and 3. If made uniform, which we suppose it is now, equal bulks of black powder and Dittmar will give the best results. (See F. and S. of Feb. 21 and March 21.)

O. D. H., Urbana, O.—What shall I do for my pup? He is five weeks old, and yesterday morning he appeared to be weak in his front legs, and they would not sustain his weight. I suppose he has sprained his ankle, but it has not swollen any as yet. Is there hope of recovery? He was not born in this condition. I have bandaged and splinted his legs. What else shall I do? Ans. Give him time and proper nourishment, and he will come round.

G. A. G., Danville, P. Q.—I have a pair of cocker spaniel dog pups, nearly six weeks old. Discovered to-day that one was ruptured, the latest pressing out about the size of a large English cherry. The pup has always been, and is now, apparently well and healthy, and full of play. Have separated the pups, and kept the ruptured one in the house, where he is pretty quiet. What shall I do for him? Ans. The operation for hernia can only be performed by a skilled surgeon. No other cure for the dog.

A. B., Manchester.—1. Please inform me in regard to the — breech-loader. Do they rank as first-class makers? Is the gun they make top-over, snap-action extension rib patent simplex, independent extraction, rebounding bar locks a first-class gun? 2. What is the price of the first and second quality? 3. Where can I buy the guns? Ans. 1. Yes, a first-class arm in every way and of a celebrated maker for shooting and high finish. 2. Messrs. John P. Moore's Sons, 500 Broadway, N. Y. 3. First grade \$300, second \$250; but an excellent gun can be bought for \$150 to \$200.

W. J., Richmond, Va.—In reducing a Creedmoor 300 yard target I find that a one inch bull's eye is proper at 25 yards. Will the margin around the bull's eye, when using an aperture sight, present the same appearance on both targets? Or in other words will the same aperture answer for both bull's eyes—8 inch and 1 inch at the 200 yards and 25 yards? Ans. As a general thing it will, but there are some men's eyes which require a special sight, say with a smaller or larger sight according to the eccentricities of their vision. It might require some experimenting on your part to get it right to suit you.

D. F. B., Strasburg, Va.—1. Is there any way to prevent moose from making the feet sweat? 2. A miller some miles below us has placed a high dam across the river without any fishway, thus preventing the bass ascending the river. Can he not be obliged to place a fish way in his dam? Ans. 1. A roomy moose should not make your feet sweat. This is, however, in great measure constitutional. Some persons are troubled in this way where others experience no trouble. 2. We know of no law in your State which can help you. Stir up your representatives to enact suitable statutes.

Bounces, Augusta, Me.—1. Please give a description of a pointer dog. 2. For what purpose are a cat's so called whiskers? Ans. 1. A pointer is a straight-haired dog, with a keen scent, used for discovering game birds. Will weigh from fifty to seventy pounds. We should think any fellow knew that. 2. Certain animals have such a growth of bristles in order to add to their sense of touch. It is said that a rabbit may be blindfolded and find his way out of a tortoise alley made out of books without throwing down any of them, but when his whiskers are shaved and he is blindfolded he blunders.

J. B. H., Plymouth, N. H.—Would it be asking too much of you to republish an article on dressing flies? I think it was by Thos. Norris, and appeared in F. and S. I think in May '74. You must have had dreeds of readers that it would be new to. Ans. The article referred to occupies fifteen pages of "Hallow's Sportsman's Gazetteer," and is illustrated with diagrams showing how to dress trout and salmon flies. It is too long to reprint in our paper, but parties wishing it can obtain the Gazetteer at this office, or the four numbers of the FOREST AND STREAM which contains it. It contains the most complete instructions yet printed.

H. M. S., Pittsburgh, Pa.—1. I want a gun and am tired of large bores. Can I get a good penetration out of a 7 1/2 pound 14 gauge as out of a 12 gauge same weight? Will pattern also be as good. I want said gun for upland shooting on y. 2. What would be proper pattern for such a gun with 3 drs. powder, 1 oz. No. 8 shot, modified choke? Would 175 and 200 be too much at 40 yards, 30 inch circle? 3. Would such a gun handle as well with 31 inch barrels as with 30 inch? Ans. 1. Relatively, taking differences of charge, the 14 produces excellent effects. Of course their being less shot in the diminished load there cannot be, at long distances, as high patterns. It is proportional. 2. It would be a good pattern. 3. Thirty inch the proper portion, over that out of balance.

T. A. S., Macon, Mo.—1. What make of gun does Capt. Bogardus use now, since he has laid aside his "old reliable" Scott? 2. Was the Daly gun exhibited at the St. Louis 'dog show? 3. How long would it take to have a gun made by Scott, Birmingham? 4. Do vents in breech of muzzle-loading shot-guns do any good? 5. I have a muzzle-loader 10 bore 30 inch barrels, 11 pounds. Could I trade it for an \$85 Remington second-hand gun? Ans. 1. Capt. Bogardus is still using his "old reliable" Scott gun and will continue until the new one, an exact duplicate of the one he is now using, is received. 2. Yes. 3. It requires from four to six months to have gun made to order by W. & C. Scott & Son. 4. Not thought to be of any use. 5. Could not tell you that.

W. F. S., Indianapolis.—1. Bought, or traded for, a dog some two weeks ago. She suddenly disappeared, and after a long search, I found her in the hands of a butcher. He says he bought the dog, and I guess he told him what he says. I want you to tell me how I can get her. I bought her first, and he bought my dog. Now, how can I get her with the least trouble? She is a fine dog, and I don't want to lose her. He says that he will let me have her if I will pay him what he paid for her and what she has eaten, but I won't do that. Ans. The butcher must return your dog, any court of law would make him do it. No one can hold stolen goods. If he has fed your dog that does not entitle him to remuneration for such board. Fairness and justice are all on your side. The butcher is the victim of his misfortunes, not of his faults.

J. L. H., Huntingdon, Tenn.—A friend's foxhounds are strangely and fatally afflicted. Four have died within two days. Symptoms—Dogs become restless, then begin to rub side of the head with his fore feet; then comes a violent itching, and he wildly claws his head and appears determined to tear it to pieces; suffering intense. In ten or fifteen minutes he becomes quiet and remains so for ten or twelve minutes, when the same symptoms return, apparently more violent with each successive return, which is kept up at tolerably regular intervals for about twelve hours, when the dog expires in the greatest agony. Food—Corn bread baked for the purpose. A few days before dying the dogs had eaten a hog which had died with the cholera which seemed to fatten them. General condition previous to attack, good; coat, glossy and fine. What is the matter? Ans. It may be that the dogs have been poisoned through the unhealthy meat, and this is probably the case.

W. E. L., Cincinnati.—1. Can a duck cloth suit be washed without spoiling it? 2. Please give me the charge of shot and powder for a muzzle-loading 12-gauge 7 1/2 lbs. shot gun? What is considered a good target at 40 yards with such gun? 3. How high should a glass ball be

when shot at out of a trap? 4. Did "—" ever write for your paper? 7. Is "D—" an Englishman? Ans. 1. Yes, but not in too hot water, not more than barely tepid. Do not dry in the sun. 2. As to your dog, shoot May probably. 3. Do not breed pointer, there are enough improved animals to be found at present. No harm in the cross, but it is better to keep the strains separated. 4. 3 1/2 drachms powder, 1 1/2 of shot, about 150 to 200 according to size of shot. 5. The trick to hit a glass ball is at the moment of apparent rest, at the height of its rise, and about to fall. Distance varies—about 25 feet high is usual. 6. Yes, and to the same person. 7. Think he is.

A. T. F., Oshawa.—1. In the first trial of my Creedmoor Remington rifle I was obliged to use at 600 yards 1 min. and 31 sec., whereas Remington's table of elevation says the elevation is 1 min. and 13 sec. I use 95 grains of F. B. Hazard, Weber's formula, made expressly for the Creedmoor Remington. Is this great difference of elevation owing to the formation of the gun, or is the powder not the proper kind? If not what brand is better? 2. How often can a Remington shell be used without cleaning? and give me a receipt for cleaning. Ans. 1. This greater elevation is owing to the difference in shape of gun with which table was made. Your powder is right as to quality and quantity. 2. Can be used over and over again, but must be cleaned every time. Use warm water in which bi-carbonate of soda has been dissolved. Would advise you to write to the Messrs. Remington who will send you an excellent treatise on rifle shooting, covering the whole subject of shells, rifles, etc.

O. E. S., Bloomfield.—1. How many leaves of a Harper's Magazine would be considered good penetration for a fine gun, 7 1/2 lbs., 12 bore, to break with charge 3 1/2 drs. powder, 1 1/2 oz. No. 6 shot, at 40 yards? Also, how many newspapers folded in a pad 6 1/2 ins.? 2. Some of your correspondents say small shot require more powder than large. 3. What would you consider correct charge of powder in shooting blue buckshot out of a 7 1/2 lb., 12 choke-bore? 4. Give first quality, shot 3 1/2 drs. powder, 1 1/2 oz. No. 6 shot, without any disagreeable recoil. Ans. 1. It is possible for us to give penetration with magazine. We have to give it up, because there is variation, depending on quality of paper, in fact, unless the Denmead pad is used, we can give no opinion. It is something like judging of size, when a man says, "About as big as a bit of chalk." 2. Our correspondents are in error, we think. 3. 4 drs.

C. E. F., Calawissa, Pa.—1. Describe, in a few words, the process of making laminated steel for gun barrels. How do laminated steel barrels differ from Damascus barrels? 2. Will tea lead answer for rifle balls? 3. How can I ascertain how much tin or other alloy the above metal contains? Ans. 1. Laminated barrels are made of what are called "mild steel scraps," such as saw cuttings, old springs; are cleaned and placed for fusion in a furnace. Blooms are made, then these blooms are forged, and, under the hammer, made into rods. These rods are bundled, welded, and drawn through a rolling mill. Damascus barrels are made of the finest quality of iron, and all depends on the twisting, bending and manipulation of the wire give the pattern. 2. It will. 3. Lead is insoluble in sulphuric acid, and is soluble in nitric acid; tin is soluble in sulphuric acid, and is insoluble in strong concentrated nitric acid. If lead is wanted, tin can be removed by alkali also.

Subscribers, Montreal.—Your question, we think, never came to hand in regard to St. Bernards. We hasten to reply. Two styles of St. Bernards are shown—the rough and the smooth. The rough-coated has the following characteristics: A large dog to weigh as much as 180 lbs., and to stand 34 inches high at the shoulder; head, resembling that of a Newfoundland, but with more crown; ears very little feathered, like those of a mastiff; lips penulous; eyes very thoughtful; the hair ashen, and the red portion of the eye, characteristic; body, massive and muscular; chest wide, deep, with strong loins; legs perfectly straight, this up and down of the leg a strong point; foot, large and flat; dog ought to have deer claws; coat, bridle or tawny, white blaze on the face not out of the way. The smooth-coat is generally of a lighter build, rather narrower at chest, and more leggy. We think that judging St. Bernards in the United States has not been strictly up to the English standard. We are afraid that before many years this superb dog will be lost as to purity, as the monks of the Hospice require his services no longer. It may be worth mentioning that the St. Bernard is slow of growth, some two and a half years must elapse before he matures.

F. M., New York.—1. Where does the authority come from, to call a sail-boat made of boards, a "canoe," as the Rob Roy canoe? On the American frontier there are "canoes" and "dog-outs," the former of bark, and the latter a hollowed log, although the last are sometimes spoken of as "log-canoes," or "dog out canoes." 2. In my boyhood, to scull a boat meant to use only one oar at the stern; within the past twenty years the oarsmen apply it to rowing. How can we tell what is meant if the speaker is not an oarsman, and why don't we have racing with a scull proper, a single oar? 3. Where do the poets in Faust and Schwan get their authority for rhyming coyote with wife? When I was on the frontier it was pronounced ky-o-te, with accent on the second syllable. Ans. 1. The Rob Roy canoe is not a "sail-boat" made of boards, but a boat propelled by a paddle instead of oars. It is the use of the paddle that distinguishes a canoe from a rowboat. The Rob Roy's sail is merely auxiliary. 2. An oar and a scull differ in size. Oars are so large that a man can pull two at the same time. A scull is so small that a man can pull two at the same time. A boat is rowed by either oars or sculls. Strictly speaking, it is sculled only when a single oar or scull is used at the stern. 3. As to kyote or ky-o-te, the latter with the accent on the penultimate is the proper pronunciation. Our correspondent, "F. M.," who is a poet himself, should understand that the Eastern rhymester, who has never seen a ky-o-te, might write

"On thee I dote,
My fond kyote."

Of course, blanchements lavished on the byena of the plains may not be strictly true, yet the verse, as he must confess, is highly melodious. Now, your Western verse-singer, never sacrificing sense to sound, might smash out something like the following:

"Thou mangy, sneaking ky-o-te,
Thou nasty canas—thou high old C!"

We invite a few rhymers, if not more than four lines, on ky-o-te, and challenge the poetical "F. M." to enter the lists.

FALL RIVER LINE.—The travelling public will learn with pleasure that this favorite line has placed upon the route their magnificent steamer "Providence." She has been thoroughly overhauled, and is now in splendid condition for her season's trips.

ELM CITY AND CONTINENTAL TO NEW HAVEN.—These fine boats, which run every day between the metropolis and the Elm City, are spacious, well fitted up, and admirably managed. Between the two points they go to and fro unceasingly, and keep up the time of arrival with the regularity of a chronometer. Now, that spring and summer are coming, there can be no more pleasant method of traveling. Perhaps there never was a captain more popular than the veteran of the Elm City, who has navigated the Sound, man and boy, for the last forty years.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INSTRUCTION IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

-AT-

No. 111 (old No. 103) FULTON STREET, NEW YORK.

[POST OFFICE BOX 2832.]

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Twenty-five per cent. off for Clubs of Three or more.

Advertising Rates.

Inside pages, nonpareil type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial columns, 50 cents per line.

Advertisements should be sent in on Saturday of each week, if possible.

All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

*Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, APRIL 11, 1878.

To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith and be addressed to the FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. No anonymous communications will be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of the mail service if money remitted to us is lost. NO PERSON WHATSOEVER is authorized to collect money for us unless he can show authentic credentials from one of the undersigned. We have no Philadelphia agent.

Trade supplied by American News Company.

CALENDAR OF EVENTS FOR THE COMING WEEK.

Thursday, April 11.—Miniature Yacht Race, Boston, Massachusetts Rifle Association; Amateur Series at Walnut Hill. Base Ball: Providence vs. Yale, at New Haven; New Bedford vs. Matesnet, at New Bedford. Running Meeting at Mobile, Ala.

Friday, April 12.—Oxford-Cambridge sports. Running Meeting as above.

Saturday, April 13.—Boston Bicycle Club Run to Arlington; New York Scottish-American Club Games; Oxford-Cambridge Race. Rossmore Rifle Club, at Staten Island. Creedmoor: Sharps Rifle Company Badge, at 11:30 A. M.; Turf, Field and Farm Challenge Badge, at 1:30 P. M.; Spirit of the Times Medal, at 3 P. M.; Seventh Regt. Rifle Club Match; Irish-American Mid-range Badge; Creedmoor, Jr., Prize Match. Base Ball: Harvard vs. New Bedford, at New Bedford. Running Meeting as above.

Monday, April 15.—English Amateur Athletic Championship Meeting, Empire vs. New York Rifle Clubs. Base Ball: Auburn vs. Picked Nine, at Auburn.

Tuesday, April 16.—Creedmoor, Jr., Prize Match. Auburn vs. Rochester, at Auburn; Harvard vs. New Bedford, at Fall River; Cricket vs. Hornell, at Hornellsville.

Wednesday, April 17.—Manhattan Cricket Club, at Prospect Park. Creedmoor: Ballard Rifle Mid-range Badge, at 1:30 P. M.; Appleton Prize, at 3 P. M. Base Ball: Rochester vs. Utica, at Utica; Auburn vs. New Bedford, at Auburn.

ANSWERS TO CORRESPONDENTS.—We answered last week one hundred and thirteen questions of seventy-one correspondents in fifteen States. There were besides these many which we received too late for insertion, and some rejected as silly. The space devoted to this part of our paper is constantly increasing to meet the pressure, and innumerable letters testify to the popularity and value of these columns.

—Capt. Ducaigne promises us copies of some unpublished autograph letters of Henry Wm. Herberth, which we shall frame in memory of the subject and the donor.

WHERE OUR PAPER CIRCULATES.—A Warsaw, Ill., subscriber wonders how the impression has got abroad that the FOREST AND STREAM circulates chiefly at the East, when he finds it all over the Western country. The impression is perhaps a natural one, because our publication office is at the East, but it is altogether erroneous, as a statement which we published last week shows. Leaving out the State of New York, where we are distributed among 300 post-offices, we find that our Eastern circulation, including Canada, embraces 701 post-offices, while our Western circulation reaches 725. It is quite likely, however, that we send more copies of our paper to the Eastern offices than we do to the Western, although if the Western clubs keep coming in as they have been doing the past two weeks, they will soon overhaul the East lap, and carry by—that's all.

By the way, our post-office circulation in Pennsylvania was given in our last issue as 61; it should have read 161.

ANOTHER LARGE ADIRONDACK PARK.—A MOVEMENT WHICH IS LIKELY TO BE BENEFICIAL.—Dr. W. W. Durant, President of the Adirondack Railway, with Messrs. Cheney and Rosekrans, of Glens Falls, N. Y., own and control about 700,000 acres of land in the choicest part of the Adirondack region, and they have a plan in mind to add enough more land to make 1,000,000 acres, form a club, get a charter, and make an effort to protect the game and fish. Then say to the guides, "You may hunt or fish on this land or these waters as much as you please in season. If you hunt or fish out of season, or we hear complaints from the people that you guide into the woods of overcharge for service, or anything else unbecoming a guide that will make the Adirondacks a by-word and reproach, you must seek other fields and pastures new. We'll have none of you." The move is to be for the protection of the game and protection of people who frequent the woods. As some some of the best fishing and hunting is on or in these very woods and waters, it would be for the interest of the guide to do right. It is not the intention to make a park in the sense of Blooming Grove Park, but rather a mutual protection society.

THE ALLIGATOR INDUSTRY.—We know not how many fortunes encased within the hide of the Florida alligator have been permitted to bask in the sun of summer and sleep in the mud of winter. But now that, like the unshapely casket pulled from the sea by the fishermen in the Arabian Nights, this ungainly monster's armor is found to contain gold—or silver—the alligator industry is assuming important proportions. It may be that the "Florida Swamp Crocodile Hide Tanning and Oil Refining Company, Limited" will be in the prime of its power when its northern prototype, the Hudson's Bay Fur Company, shall have become a thing of history. The hides bring seventy-five cents each, and the revenue accruing from the oil adds to the profit. Three men in Louisiana, last winter, killed 9,000, and will soon, we should suppose, retire from the business, and adopt for their family coat of arms an alligator rampant.

GOOD ORANGES TO BAN HOUSES.—Some of our correspondents have informed us that consignments of oranges, forwarded to certain parties in New York, have been reported by the receivers as having been all damaged, and returns for charges have been made. We have been the recipients of quite a number of packages of oranges from Florida this season, and all of the parcels came to hand in prime order. It is our duty to warn our Southern friends to be careful as to whom they ship their goods. It is wiser not to be carried away by flaming and specious advertising circulars. Find out reliable old houses—there are plenty of such—and make consignments only to them. The Sun exposes rascals on the consignment lay every week.

NOR SPORT.—Running a horse down at the rate of 100 miles in ten hours at the Prospect Park track, the pounding of a plucky man nearly to death by a superior antagonist, who scarcely received a scratch, and the shooting at an apple on a woman's head in a theatre, missing the apple and killing the woman—these doings are not sport, although so designated in the placard of announcement.

"ANOTHER STATE HEARD FROM."—Last week, in giving the number of towns to which the FOREST AND STREAM AND ROD AND GUN finds its way, the types made us say "Pennsylvania, 61." It should have been "Pennsylvania, 161," which looks better, reads better and pays better.

—In our issue of March 28 we printed an article from Dr. Kenworthy entitled, "Marooning," detailing a coastwise trip in Florida. The Doctor complains, with good reason, that the types made him say "lug a cruise" instead of "lay a course." In one place, where he wrote "eight miles to the east," the printers had it "to the west." Such is the bitter fruit which this author is made to pluck from his choicest planting.

—The first illustrated lecture of B. Waterhouse Hawkins, S. D., on Natural History and Art, is delivered at Chickering Hall this evening.

FOREST AND STREAM will be sent for fractions of a year as follows: Six months, \$2; three months, \$1. To clubs of two or more, \$3 per annum.

GAME PROTECTION.

MEETINGS OF STATE ASSOCIATIONS FOR 1878.

New Hampshire State Sportsmen's League, Manchester, April.
New York State Association for the Protection of Fish and Game, Buffalo, May—; Secty., John B. Sago, Buffalo.
Connecticut State Sportsmen's Association, Hartford, May 15.
Iowa State Sportsmen's Association, Des Moines, May 28.
Nebraska State Sportsmen's Association, Fremont, May 21st and 22d.
National Sportsmen's Association, Wilkesbarre, Pa., June 11.
Illinois State Sportsmen's Association, Quincy, June 11.
The Pennsylvania State Association for the Protection of Game and Fish, Wilkesbarre, June 11; Secty., Benj. F. Dowance.
Ohio State Sportsmen's Association, Cincinnati, June 15; Secty., Wiltbank, Toledo.
Tennessee State Sportsmen's Association, Nashville, Dec. 2; Secty., Clark Pritchett, Nashville, Tenn.
Wisconsin State Sportsmen's Association.
Massachusetts State Sportsmen's Association, at call of President.
Missouri State Sportsmen's Association.

MESSINA QUAIL.

Quite a number of letters having been received by us from clubs, members of which were desirous of importing the Sicilian quail, we have addressed a correspondent in Messina, who has kindly furnished us with the following:

MESSINA, March 21, 1878.

EDITOR FOREST AND STREAM:

Your favor of 2d to hand, in answer to which we beg to give you all information relative to quails. The cost is 50, each bird. They must be put in proper cages, which cost 12s. 6d. each, containing 100 birds. Feed for every hundred for at least thirty days' passage, about one bag and a half of hempseed, 2s. 18d.; freight for a cage, 2s.; fees to the steward of the steamer to feed them during the passage, 2s. If you wish any birds, please write to me at once, otherwise I cannot be in time, as the season is from the 10th of April to the 10th of May. You would have to deposit the amount of invoice to Messrs. Phelps Bros. & Co., of your city. I am, dear sir, yours truly, DR. BONANNO.

—The Waltonian Club of New Haven, Conn., offers a reward of fifty dollars for any evidence that will lead to the detection and conviction of any person or persons violating the trout law. All reliable information given to any member or the Secretary of the Waltonian Club, P. O. box 1613, New Haven, Conn., will be immediately placed in the hands of their attorney and suit brought against the offenders forthwith.

NEW YORK ASSOCIATION.—At the monthly meeting last Monday, Senator Alfred Wagstaff, Jr., of the Committee on Game Laws, reported that a bill in the Assembly in relation to the appointment of State Game Constables was progressing favorably. It was proposed to amend the law for the incorporation of associations of all descriptions by inserting the words, "Association for the Protection of Game." Mr. Whitehead drew the attention of the association to the fact that a number of bills providing for the modification of the game laws in the interest of certain localities had been introduced in the Legislature. They were detrimental to the general laws for the protection of game, which had been passed after so much labor, and should be condemned. The following were elected members: District Attorney Benjamin K. Phelps, J. Hanson Rhoades, Paul Thebaud, Dr. Frederick G. Winston and Perry Belmont. Mr. Whitehead made a satisfactory report on the condition of the lawsuits in progress. The proposition to establish a club-house and game preserve outside of the city was tabled.

PROTECTION IN KENTUCKY.—Through the energetic President of our State Commission, Mr. Wm. Griffith, of Louisville, and four accomplished Senators, Hon. Henry Bruce, member of State Fish Commission, an appropriation of \$3,000 for artificial propagation of fish in Ky., was made in the Legislature. Some wholesome and greatly needed amendments to our State Fish Law, were projected by those enterprising commissioners, and have been passed, we hope, asscining, netting and speoding have been practiced with impunity by many of the don't-care-a-damn ilk, because an affectionate regard for out-buildings, hay stacks and fine stock restrains riparian farmers from procuring warrants against violators whom they detected. An amendment which will develop violations before Grand Juries will work wonders in the protection of our streams by constraining to observance of the law through fear of the penalty of violation. KENTUCKIAN.

Stamford, Ky.

—The Howell, Mich., Shooting Club have rigidly enforced the game and fish laws and effectually stopped the wholesale spearing of pike and bass in the streams and lakes of that vicinity.

—The Grand Jury of Knox, Ind., have indicted parties for illegal seining.

The Rifle.

MASSACHUSETTS RIFLE ASSOCIATION.—The Massachusetts Rifle Association opened the season April 3, at Walnut Hill range, by a competition in the "shot-gun match," begun last fall. There were seven entries. The following are the scores, which are good for the first meeting:

W M Jackson.....	500-5 5 4 3 5 5 5 5 5 5 5 5 5 5-70
A H Hebbard.....	1,000-5 5 5 5 5 5 5 5 5 5 5 5 5 5-204
Salem Wilder.....	900-5 5 4 5 5 5 5 5 5 5 5 5 5 5-65
N Washburn.....	1,000-3 3 4 4 4 5 5 5 5 5 5 5 5 5-20
J S Sumner.....	900-3 5 5 5 5 5 5 5 5 5 5 5 5 5-64
C C Hebbard.....	1,000-5 5 5 5 5 5 5 5 5 5 5 5 5 5-177
H Tyler.....	900-5 5 4 5 5 5 5 5 5 5 5 5 5 5-66
	1,000-3 5 5 5 5 5 5 5 5 5 5 5 5 5-177

NEW HAVEN.—On the third the regular monthly meeting of the New Haven Rifle Association took place at the Quin-

niptic range. Major Stetson carried off both prizes. The following were the scores:

Military Match.		500 yds.	
200 yds.		500 yds.	
J E Stetson.....	4 4 4 3 4-26	4 4 4 5 5 1-30-56	
P O Connor.....	4 4 4 3 4-26	5 5 5 4 5 4-28-54	
F J Colvin.....	4 4 4 3 4-26	4 3 5 5 5 5-21-63	
S R Smith.....	4 4 4 3 4-27	2 3 5 5 4 4-25-62	
F Brown.....	4 4 4 3 4-27	4 5 5 3 0 4-25-62	
A Z Downs, Jr.....	2 4 3 4 4-25	3 2 3 4 4 5-25-63	
L O'Brien.....	4 4 5 5 3 3-23	3 3 3 0 5 0-17-45	
W F Smith.....	0 4 3 4 3 3-19	3 1 5 2 3 6-24-43	
S J Fox.....	3 5 4 4 2 4-25	5 2 2 3 3 3-21-48	
All-Comers' Match.			
J E Stetson.....	4 5 4 4 5 5 5 5-46		
W E Storey.....	5 5 4 5 5 5 5 5-46		
D A Rulickhoiz.....	5 5 5 5 5 5 5 5-46		
C Gordon.....	4 5 4 4 4 4 4 5-38		
Charles Gorner.....	4 4 4 4 4 4 4 5-39		
Frank Tiesing.....	0 4 4 4 4 4 4 3-34		

The team from the Second Regiment, which is to contest with the team from the First Regiment for the possession of the trophy won by a joint team from both regiments, in the inter-State match at Creedmoor in 1875, has been decided upon, its composition being as follows: Captain Kennedy, Sergeant Crampton, Privates Whitlock and Smith, Co. A; Corporal Walker, Privates Folsom, Tinkey, Jorey and Nicholas, Co. E; Sergeant Craig, Co. H; Lieut. Lane, Co. I; Sergeants Mix and LaBarnes, and Corporal Keene, Co. K. Of the above named, Sergt. Craig of Co. H, and Corp. Keane of Co. K, will act as reserves, the other twelve being the regular team.

MASSACHUSETTS RIFLE ASSOCIATION.—The competitions in the two unfinished matches of 1877 were resumed this week. Yesterday the long-range match, for a valuable shot-gun and other prizes, was contested, and on Saturday a score in the "no cleaning" match, at 200 and 300 yards, will be shot. On Thursday, April 11, there will occur the first competition at 200 yards in the "Amateur series," limited to those members who did not win first prizes in 1877. On the same day there will be a match at 600 and 900 yards, five shots at each distance. The dates of the spring meeting have been fixed for Wednesday and Thursday, May 8 and 9. On these days there will be six or seven matches, at various distances, the prizes in each match aggregating upward of \$100 in value. The official programme will be issued soon.

CONLIN'S GALLERY.—The distribution of prizes for the winter open tournament took place at Conlin's gallery, Saturday. The shooting for two months past was at the ready measurement targets, 110 feet, 22-calibre rifles. Ninety-six marksmen participated, making 400 targets. To the best forty, prizes were awarded. Ten rounds per man were fired, the score being determined by aggregating the distance of the points struck from the centre of the bull's-eye. Mr. Obasles E. Blydenburgh, of the long-range team, took first place with the low string of 8 15-16 inches. The prizes, consisting of revolvers, meerschaum pipes and ornaments, valued at \$200, were distributed to the winners. The following is the record:

Inches.		Inches.	
C E Blydenburgh.....	3 15-16	V Daly.....	6 15-16
D Banks.....	4 3-8	C Judson.....	6 5-16
Wm Hayes.....	4 3-8	L Bird.....	6 3-8
W M Farrow.....	4 7-8	C E Zettler.....	6 3-8
J B Blydenburgh.....	4 7-8	F O Dowd.....	6 7-16
M M Malby.....	4 7-8	W H Chadwick.....	6 7-16
Fred Adler.....	4 7-8	T Fitz.....	6 1-2
S W Sibley.....	4 7-8	C A Cheever.....	6 1-2
L M Riggs.....	5	A E Moore.....	6 1-2
P Fenning.....	5	J F Murch.....	6 5-8
Dr Dudley.....	5 3-16	N B Thurston.....	6 5-8
M B Engel.....	5 7-16	F A Dugan.....	6 13-16
A J Howlett.....	5 1-2	P Lorillard.....	7 1-16
M O'Donnell.....	5 1-16	J F Treackle.....	7 1-16
F H Holton.....	5 3-4	H D Blydenburgh.....	7 1-16
D E Vanneet.....	5 13-16	F Boorten.....	7 1-8
Jas Ross.....	5 15-16	E Holzmann.....	7 1-4
C H Johr.....	6 1-4	F A Greenburgh.....	7 1-4
F Kessler.....	6 1-4	A E Long.....	7 3-8
Jas Shand.....	6 1-4	H B Leckler.....	7 7-16

FISHERVILLE.—At a match made between teams of the Fisherville, South Cayuga and Selkirk rifle clubs, seven men in each team, on the 8d of the month, for a field glass, to be won three times, the following was the result. Conditions—Five shots at 200, 400 and 500 yards:

	200 yds.	400 yds.	500 yds.	Total.
Fisherville.....	123	99	105	327
Selkirk.....	123	81	116	320

ROSSMOOR RIFLE CLUB.—This club will hold matches on April 13, May 11 and June 8 and 22, July 20, Aug. 17, 31, Sept. 4, for a rifle badge presented by Mr. J. R. LeRoy. Distance, 200 and 300 yards; seven rounds; two sighting shots. Prize to be awarded to the competitor winning it three times (not necessarily consecutively) in any one year. Pool matches will take place on Oct. 12, Nov. 16.

Pool matches—Distance, 200 yards; position, standing; rifle, any; rounds ten, with privilege of two sighting shots. Entrance fee fifty cents. First prize, three-eighths of entrance money; second prize, one-quarter of entrance money; third prize, one-eighth of entrance money. The rifle badge and pool matches are open to the members of the club, and to all members in good standing of any rifle club or association in the world. The latter must bring with them proofs that they are members in good standing of their respective clubs or associations. Rifles to conform strictly with Section II (Rifles), paragraphs 1 and 2, of the regulations of the National Rifle Association, and of the Rossmoor Rifle Club. No previous practice allowed within 15 minutes of a match. In case any competition shall be prevented from any cause, the captain of the club may appoint a day, of which due notice will be given in the local and sporting papers. An officer of the club will be present at all matches, and will have entire charge of the range.

Range Committee—Geo. W. Ellis, C. Alfred Grymes, J. Rutgers LeRoy.

Train boats leave foot of Whitehall street, Staten Island R. R. Ferry, at 9 and 11 A. M. and 1 P. M., connecting with trains at Clifton or third landing for Huguenot Station. Range, eight minutes' walk from cars. Fare each way, 25 cents.

SEVENTH REGIMENT RIFLE CLUB.—On Saturday next, at 3 o'clock, there will be a competition for The Rifles. Distance, 200 yards; seven scoring shots, off-hand.

CREEDMOOR, JR.—The 100-yards range, at 260 Broadway, offers its patrons another prize match similar to the one which proved so popular last month; \$100 in gold will be divided as follows: First prize, \$20; second, \$15; third, \$10; five prizes of \$5 each, and ten prizes of \$3 each. The match began Saturday, April 6, and will be continued on each succeeding Tuesday and Saturday till completed. The

range will be open during the evenings of Tuesday to enable those who cannot compete during the day. Conditions—10 shots, position standing; competitors can enter any number of times, but can take but one prize; entrance \$1; 150 entries to fill.

A CORRECTION.—In our last issue we stated that the challenge of the Empire Rifle Club had been accepted by the N. Y. Rifle Club. The secretary informs us that such is not the case.

MEETING OF THE N. R. A.—At their last meeting the special committee on railroad transportation reported that the railroad company would run each day of the meetings trains at twelve o'clock noon, two o'clock and three o'clock in the afternoon, and more if necessary. As to rates of fare, the committee reported that the company would sell packages of 100 tickets at thirty cents each, which was a reduction of five cents from the rate of last year, but these tickets would only be good for members of the association showing their badges of membership and for members of the National Guard appearing in uniform. Major Henry Fulton, of the committee on the selection of the American team, reported, for the committee, progress, and requested that the committee be allowed to add two more to their number, thus making the committee consist of five members. The report was adopted, and Major Holland and Judge Gildersleeve appointed.

A letter having been received from General Ord commending the organization, Col. McKenzie, of the Fourth U. S. Cavalry, was elected an honorary member. Mr. Richard Oliver, of New York, offered to the association a silver trophy, worth \$100, to be shot for by teams of four men, non-commissioned officers or privates, from every company, troop or battery of the National Guard of this State. Seven shots (no sighting shots) to be allowed; position standing; to be shot for in both spring and fall matches. The offer of Mr. Oliver was accepted. The secretaries of the rifle associations of Ontario and Prince Edward Island notified the board that their associations had as yet taken no action toward the international match. Inspector of Rifle Practice Wingate moved the following:

"Resolved, That for the purpose of developing public interest in rifle association with military weapons an international rifle match be announced to take place at the annual prize meeting of this association to be held at Creedmoor in September next to be open to teams from each of the States of the Union, the Provinces of Canada, the kingdom and dependencies of Great Britain and from all other countries, each county having a national guard or militia distinct from the regular army to be entitled to send a separate team to represent each."

The resolution was adopted. Messrs. Frederick S. Young, Lloyd D. Waddell, Robert Johnston, G. Henry Wittbauss and Col. Robert Olyphant, of the Governor's staff, were elected life members of the association. Inspector of Rifle Practice Wingate moved that the convention of riflemen be held at Creedmoor on Friday, May 24, at two o'clock in the afternoon, and Major Henry Fulton moved that a committee be appointed to establish a basis of representation at the National Convention. Major Fulton's motion was carried.

NATIONAL RIFLE ASSOCIATION OF GREAT BRITAIN.—The Secretary of our N. R. A. of America is in receipt of a communication from E. St. John Midway, declining on the part of the N. R. A. of Great Britain the contest for the Centennial trophy at Creedmoor next September.

FOR THE SCHUETZVEREIN.—We are informed that at the great meeting of the German rifle clubs, to be held on June 16 to the 24, a body of Swiss riflemen, from Sant Gall, will be present, and will compete for prizes. We can promise them a hearty welcome. We are glad to mention that Gen. Dakin has been elected president of the committee of honorary members, and is already actively at work arranging the business of the contest.

MARYLAND RIFLE CLUB.—The following gentlemen were elected officers of this popular rifle club, at a meeting held April 2: President, Dr. W. H. Keener; Vice-President, Joseph S. Smith; Secretary, A. V. Canfield, Jr.; Treasurer, W. B. Oliver. Executive Committee, J. J. Turner, Jr., L. Warrington, Edward Melchoir, H. B. Coulson and Augustus Roeder. Rifle shooting will take place every Wednesday and Saturday at Patapsco range. The range will be opened for the season of 1878 on Saturday, April 13. At 4 P. M. the sixth monthly competition for the Remington revolver will take place. Glass ball shooting will be introduced on the range this season. A. V. CANFIELD, JR., Sec.

CALIFORNIA—San Francisco, March 27.—Practice for the regimental team for the match which is to take place at San Bruno on the 11th of April, has already commenced. Competitors are in charge of Capt. H. J. Burns of the Sumners, and Lieutenant A. Close of the Nationals. Shooting, 200 yards, off-hand. The following is the first practice score made:

Lieutenant J Robertson.....	4 5 5 5 5 4 4 5 5 4-40
W F Leeman.....	4 5 5 4 4 4 4 4 4 4-42
Sergt C P Le Breton.....	4 4 5 5 4 4 5 4 4 4-44

Lieut L R Townsend.....	4 4 4 4 4 4 4 4 4 4-36-63

—A friendly match between Messrs. Strecker and Farrow took place at Schuetzen Park, Alameda, the first named gentleman using a California-made muzzle-loading rifle, made by A. Browning, and Mr. Farrow firing with a Ballard breech-loader. Mr. Strecker won. Fifty shots each were fired at a target 36 inches in diameter, divided into 25 three-quarter inch rings—the bull's-eye counting 25 points—allowing of a possible 1,250. The distance was 200 yards; position, off-hand: Strecker.....1,002 Farrow.....971

String measurement gives Mr. Strecker 20 1/2 inches, and Mr. Farrow 24 1/2 inches.

SACRAMENTO PISTOL TEAM.—The team held their usual weekly match on Wednesday evening, March 20. Range, 60 feet; circular target, 10 1/2 inches in diameter, with rings counting from 1 to 11, and bull's-eye, one inch in diameter, counting 12. Out of a possible 120, the following scores were made:

Atkinson.....	10 10 10 10 7 9 9 8 8 9-92
Bullard.....	10 10 8 6 2 12 8 8 8 8-97
Brewer.....	11 11 11 10 12 12 11 9 7-106
Byers.....	11 11 11 11 7 10 10 10 10 11-102
Farrer.....	12 10 10 9 7 11 9 9 9 9-92
Gerber, H.....	5 10 9 8 8 11 10 8 8 6-82
Gerber, W E.....	6 10 10 11 5 1 6 10 11 7-77
Grimm.....	13 10 9 10 9 11 11 11 11 12-107
Kane.....	12 11 11 10 9 11 9 9 9 9-92

DR. CARVER.—A correspondent having asked us about the pull of Dr. Carver's rifle, a gentleman of Virginia City very kindly writes us as follows: "Dr. Carver does not use a set trigger nor a hair trigger. His Winchester pull off at about three pounds. His Ballard, .22 cal., pulls about four. Yesterday he shot glass balls with an army musket, .45 cal., six and a half pound pull; a gun he never saw before. It seems to make no difference with his shooting whether a gun pulls three pounds or ten pounds, so long as it pulls hard on the trigger, he claiming such studies him in sighting. Very respectfully, W. A. PARKINS.

"Virginia, Nev., March 30, 1878."

MINNESOTA—Minneapolis.—In the match reported in your issue of March 28, Quam and Slotten, who tied on the very fine score of 49 out of 50, made a second tie on one shot apiece, each making a bull's-eye; and on the third shot off, at 200 yards, Quam won, making a score of 36 to 35. M. B. R.

THE DENNISON TARGETS.—These targets are rapidly coming into use. The autumn shooting of the Massachusetts military at Framingham have used no other for the last two years. So with the "Independent Cadets" and other organizations of the kind too numerous to mention. The targets made by Messrs. Dennison & Co., of Boston, are of the same class of stock that is used in the construction of paper boats, and if properly put on to the target board will last the season through if required to.

ALL ABOUT EXPRESS RIFLES.

EDITOR FOREST AND STREAM:

In reference to the questions asked by J. N. B., in your issue of the 28th of February, with reference to the trajectory of the Express rifle, I would say that from an experience of seven years' big game shooting, using three Express rifles of different calibres, I have ascertained that the point-blank range of the .45 Express is 100 yards; that of the .50 Express 140 yards, and that of the .577 120 yards, requiring no raising of sights whatsoever up to those distances; beyond this a full front sight is sufficient up to 200 yards, the range of an Express bullet. If the Express be required for longer ranges, a reduced charge must be used and a solid ball, and then of course it ceases to be an Express. The .45 uses a charge of 4 1/2 drachms, the .50 a charge of 5 drachms, and the .57 a charge of 6 drachms, without any unpleasant recoil. So much so that I have run buffalo with an Express rifle, and used it with one band. The 12-bore Express, mentioned in the issue I have referred to, is, in reality, not an Express at all, but simply one of the large rifles used in India before Express rifles were invented; indeed, it does not carry as much powder as they did, seven drachms having frequently been used in a 12-bore rifle. If it were a true Express it would require a light hollow bullet, and from 14 to 16 drachms of powder, and must therefore weigh some twenty pounds for this reason. No Express is made of larger calibre than .577, the bore of the Sneider rifle. The very fact of its using a round ball is sufficient to prove its not being an Express, as a round ball, having a very slight hold on the grooves, requires a very slight twist in the rifling, or it will strip and lose all accuracy with a large charge, whereas an Express, hollow, conical bullet requires a rapid twist and an immense charge. For this reason a rifle cannot be made to shoot both conical and spherical balls with equal accuracy, if both are used with their proper charges. In India, where many men devote their lives to big and dangerous shooting, the Express rifle has almost entirely superseded the 12 and 10-bore, which were formerly used there, and I have been assured by a friend who has killed over 200 tigers, besides many bears, that he never owned a perfect rifle for dangerous game till he got an Express. The expanding bullet seems to paralyze an animal instantly, doubling a tiger up like a rabbit. For American shooting I consider the .45-bore large enough, there being no really dangerous game shooting, grizzly bears being so slow that they only require a man to be cool to make a certainty of killing them. I have killed about thirty with the old style of rifle, and have been told by a friend, who killed one in Utah with a small Express, that there was no fun in it, as the bear died instantly after one shot. Let me advise those ordering Express rifles to do so from a rifle-maker, and not from a gunmaker. Almost all the latter advertise Express rifles, but I have learned, by sad experience, that not one in twenty can make such a weapon. Let me explain, in conclusion, that when I say that 100 yards is the point-blank range of a small Express, I mean that from twenty yards up, no rise or fall of any consequence will be discovered up to that distance; and this cannot be said of any other rifle in the world. I hear there are some Express rifles being made now by Turner, of Fisher & Co., Birmingham, which carry much larger charges than those I have mentioned, though they are of the same calibres; and in this case they will have even a longer point-blank range, but not having as yet tried one I cannot speak of them from experience.

I am much obliged to your correspondents, "G. S." and "Parmagan," for their letters in answer to my inquiry as to the efficiency of the Winchester rifle for big game shooting, etc. I should very much like to know whether the cartridge mentioned by Mr. Winchester can be obtained from any gunmaker. I think that "Parmagan" cannot have used an Express rifle, or he would not speak of it as he does. In the first place, not one deer in twenty, when struck by an Express bullet with 120 grains of powder behind it, requires a second shot. A friend of mine, who killed sixteen tigers in a fortnight's trip in India, told me that no one took a second shot, and a charging tiger, which must be not only mortally wounded, but annihilated on the spot or he will kill you, is a much more dangerous animal than a grizzly bear. No conical ball rifle made in America would be of any use for tiger shooting; and before Express rifles were invented, 12 and 10-bore round-ball rifles were used with charges of six and eight drachms of powder, and even then were not as effective as a 45-bore Express. "Parmagan" seems to think that, if required, an Express bullet could be used in a Winchester rifle, whereas neither is the rifling suitable nor the charge of powder sufficient. A great deal of game is missed, as H. W. C. says in your paper of the 14th, from over and under shooting, and all this is avoided by the use of the Express, which has a practically level trajectory up to 200 yards, requiring only a full or fine sight up to that distance. I shall hope to report the effect of Express bullets on grizzly bears some time before next Christmas. I may say, in conclusion, that I hit a panther (or rather, puma) with an Express ball in Texas, and on removing the skin I found it on the opposite side of the neck, making only one hole (another advantage of the Express rifle).

[Though holding the Express rifle in high estimation, we must differ from "Viator" when he states that, "No conical-ball rifle made in America would be of any use for tiger shooting." We have now in type a most interesting communication from India, which shows how a tiger was done for with a ball from a Maynard, .40 calibre.—Ed.]

The Game of Chess.

NOTICE.—Chess exchanges, communications and solutions should be addressed "Chess Editor FOREST AND STREAM, P. O. box 54, Wolcottville, Conn."

Problem No. 13.
Tourney set, No. 9. Motto: E pluribus duo.

White to play and give mate in three moves.

Game No. 44.—PETROFF DEFENCE.

This game was the first of a match between two amateurs at the Athenaeum, Philadelphia:

White.	Black.	White.	Black.
Dr. J. W. Knox.	Gen. J. A. Congdon.	Dr. J. W. Knox.	Gen. J. A. Congdon.

18—Kt-K3	18—B-K3	37—K-K2	37—B-B7
19—Q-K5	19—Kt-Q4		

NOTES BY MR. D. M. MARTINEZ.

(a) Thus far every move is classical. The Philadelphia chess players are so fond of this move that it is hardly possible to find one of them not acquainted with the leading variations of this opening. The 7th move of Black is a novelty. (The best authorities advise 7—Castles, or Q-Kt B3.) It strikes us very favorably. We cannot pronounce at once on its merits, although at first sight it looks sound; and, at all events, it is not easy to find the correct way to sustain the attack.

(b) Too defensive at this moment; it gives the attack away. I would prefer R-K3 or P-B4.

(c) B-K3 would be better, in conformity with that principle of putting our pieces early in action, and leaving the adversary's cramped.

(d) This move is made with the purpose of placing, subsequently, the Kt at Q-K3, to strengthen the centre; it was first adopted, in an almost similar position, in a consultation game that Messrs. Whitman and Elson lost, against Messrs. Reichel and Congdon (*Schach Zeitung*, 1872).

(e) Lost time; Q-Q3 would have been more effective.

(f) Why not 27—R-K3, and after 28—Kt-K3, 29—Q-K3 Q-P ch; 29—K-B3 (if any other mate in a few moves), 29—Q-K3 B5 ch, taking the White R next move, with winning position. The game was then virtually lost for White.

(g) From this point the game might possibly have been drawn by White with perfect play, as the B's are of opposite colors.

Game No. 45.—KING'S BISHOP'S GAMBIT.

Played between Messrs. Andersen and Keiseritzky:

White.	Black.	White.	Black.
Herr Andersen.	Mr. Keiseritzky.	Herr Andersen.	Mr. Keiseritzky.
1—P-K4	1—P-K4	13—P-R6	13—Q-S4
2—P-K B3	2—P-K B3	14—Q-B3	14—S-S1 (f)
3—B-Q4	3—P-Q S1 (a)	15—B-K3 B P	15—Q-B3
4—B-K3	4—Q-K5	16—B-Q4 (g)	16—Q-K3 S P
5—K-B1	5—K-B3	17—S-Q3 (h)	17—B-K3 R
6—S-K B3	6—Q-K3	18—B-Q6 (i)	18—Q-K3 R
7—P-Q1	7—S-R1 (b)	19—P-K5 (j)	19—Q-K3 R
8—S-K4 (c)	8—P-Q B3	20—K-K2	20—S-Q R3 (k)
9—S-B3	9—Q-S1	21—S-K3 S P	21—K-Q1
10—P-K S4 (d)	10—S-K B3	22—Q-P6	22—S-K3 Q
11—R-S1 (e)	11—P-K3 B	23—B-K7 mate (l)	
12—P-K R4	12—Q-S3		

NOTES BY G. H. SELKIRE.

(a) This is the "Keiseritzky Defence" to the King's Bishop's Gambit. The object of the sacrifice of the Pawn is to prevent the attack of the Bishops upon the K B P, and eventually by P-Q B3 and P-Q1, to break up White's position in the centre.

(b) Intending S-S6 f, and whether P-K3 S or not, winning the exchange.

(c) If S-S6 f, P-K3 S supporting S; and if Black then reply P-K S4, White moves R-R3, with the advantage.

(d) Finely played, commencing a beautiful combination.

(e) To protect the Pawn. The object of the sacrifice of the Bishop soon becomes apparent.

(f) To save the Queen, otherwise lost.

(g) Hoping White would pause in his attack, to save the Rook, giving time for S-K2, allowing Black to Castle in safety.

(h) Time is everything now. White dare not relax, even for one move, and Black in turn is compelled to defend himself.

(i) A splendid continuation of the attack.

(j) A most admirable move, effectually shutting out the adverse Queen. Black's position is deplorable.

(k) This, of course, is intended to prevent B-B7-mate, but it enables White to finish the game in a beautiful style.

(l) A fitting termination to, perhaps, the most brilliant game ever played.

CHESS IN ENGLAND.

Game No. 46.—COUNTER GAMBIT—K T'S OPENING.

A pretty little game played in London between Dr. W. and Mr. Boden:

White.	Black.	White.	Black.
Dr. W.	Mr. Boden.	Dr. W.	Mr. Boden.
1—P-K4	1—P-K4	14—Q-R4	14—Kt-K3 Kt (a)
2—Kt-K3	2—P-K B3	15—P-K3 R	15—Kt-K3 Kt (b)
3—Kt-K5	3—Q-K B3	16—P-K R3 (c)	16—P-K5
4—P-Q4	4—P-Q3	17—P-K3 Kt	17—P-K3 P ch
5—Kt-Q B4	5—P-K3 P	18—K-Q S4 (d)	18—B-K3 P ch
6—P-Q5	6—B-K3	19—P-K2	19—P-B3 (Queen- ing) ch
7—Kt-Q B3	7—B-K3	20—R-K3 Q	20—B-K3 B ch
8—Q-K2	8—Q-K3	21—R-K3 B	21—Q-K3 P ch
9—Kt-Q3	9—Kt-K3	22—K-K3	22—Kt-K3 R ch
10—Q-Q Kt5 ch	10—Q-Kt Q2	23—Kt-K3 R	23—Kt-B3 ch
11—Q-K3 Kt P	11—Castles K R	24—K-Q S4	24—Q-K3 Kt checkmate (e)
12—Q-K3 Q B P	12—Q-R B3		
13—Q-K5	13—Kt-K4		

NOTES BY CHESS EDITOR "LAND AND WATER."

(a) A beautiful sacrifice, which initiates a remarkably fine combination.

(b) Black could not have entered upon this attack before capturing the Kt, as White in reply could have taken off K P with the Kt.

(c) If White rejoins with Q-Q1, Black plays B-B3, threatening to win the Queen.

(d) If he takes the P with K, he evidently loses the Queen.

(e) A pretty ending to a singularly brilliant little game.

CHESS DIRECTORY.

The following is the locale of the several chess clubs and chess rooms of New York and Brooklyn:

New York Chess Rooms.—101 East 11th st., corner of Union Square; Captain McKenzie, Manager.

Turner Hall Chess Club.—Nos. 65 and 63 East 4th st.

New York Chess Club.—Cafe Cosmopolitan, No. 14 Second ave.

Manhattan Chess Club.—Cafe Logelien, No. 49 Bowery.

BOAT AND YACHT BUILDING.—A KEEL YACHT.

By NAUTICUS.

DIAGRAMS 42, 43 and 44 give the model of a keel yacht twenty-four feet long on the water-line, twenty-six and one-half feet long over all, eight feet beam, and two feet six inches draught of water. The dimensions may be larger or smaller to suit individual requirements. This model presents some peculiarities of form, and is designed for speed. The midship section is small when compared with the area of the load water-line and the general dimensions of the vessel, thus giving a small hull under water and small direct resistance, enabling the yacht to sail close to the wind. The ballast must be carried as low down as possible, and is best of iron, cast to fit between the timbers and fastened securely in place so that it cannot shift its position. A lead or iron keel may be used with advantage. Diagram 45 shows the method of fastening a lead or iron keel. A is a longitudinal timber—called a keelson—fitted on top of the floor timbers; iron bolts are run through the iron or lead shoe and the keel, and fastened on top of the keelson. The keel shown on the sheer plan is curved on its lower edge, and is called a rocker keel. The centre of lateral resistance is marked on the sheer plan by a dot enclosed in a circle. The centre of gravity of the displacement is just back of the centre of lateral resistance, between it and cross section number nine. The inclined water-line for an inclination of

ten degrees—is marked on the half-breadth plan by dotted lines, the dotted line B represented the immersed and the dotted line C the emerged side of the vessel. The dotted lines on the body plan show the method employed to obtain the inclined water-lines on the half-breadth plan, measurements of width being taken on each cross-section of the body-plan—along the dotted lines—and transferred to the corresponding sections of the half-breadth plan and a batten bent to take in all the points in its curve. The area of the midship section is about nine and one-half square feet for the dimensions of the yacht as given above, requiring a sail of six hundred and fifty square feet area, equal to seventy square feet of sail to every square foot of midship section. Centre of mast seven feet nine inches, to eight feet back of the rabbet of stem; rake of mast one half inch to a foot; the sail measures on boom twenty-seven feet; along gaff, eleven and one-half feet; hoist, twenty feet; lurch of sail, thirty-one feet and three inches; from mast to point of bowsprit, eighteen and one-half feet; rise of the outboard end of boom, two feet and nine inches. These measures will bring the centre of effort of the sails from nine inches to one foot back of the centre of lateral resistance of the vessel. The reefs should be arranged in such a manner that the centre of effort of the sails will preserve its proper position, and I may be pardoned if I add that reefs are made to be used; do not let fool hardness or the fear that folks will think you are afraid deter you from reefing

sail when necessary, if the vessel inclines to such an extent that water comes on deck, or if the wind is flawly reef. Indeed, if speed is an object, I would not let the vessel incline more than fifteen degrees, and a less inclination would be desirable. The planking for this yacht may be three-fourths or seven-eighths of an inch thick; ribs from one to one and one-fourth inch thick, two inches wide at keel and one inch wide at deck; ribs placed nine or twelve inches apart; the other timbers in proportionate size. The keel may be five or six inches thick at the mid section and tapered toward the ends—if a lead or iron keel is used—otherwise, as shown on the diagrams. The stern of the yacht is represented in the diagrams as round. If the ordinary yacht stern is preferred the alteration is easily made. If the keel and lower part of the model is cut off at the water-line marked D on the body-plan, and an eight-foot centre-board provided, the yacht would be suitable for Florida waters and would draw but one foot of water; the area of the midship section would be reduced and the sails must be reduced in like proportion. This model has more sheer aft than is usual, the high stern giving better form to the inclined water-line and not adding much extra weight to the top side. Another peculiarity is the shape of the ribs or timbers, straight or nearly so under water with the greatest curves at the bulge, consequently easily formed. The water-lines run out at the stern without any hollow, and the planks are easily fitted. This model will make a good schooner by placing the cross-sections farther apart so that the proportion of width to length will be about one to four; very little alterations in the lines will be required. To calculate the area of the midship section, the load water-line, or any irregular figure, divide the enclosing parallelogram into squares of one foot, one inch, or any known measure, and the sum of the squares and fractions of squares—enclosed by the figure of which the area is required—is the area. This is the simplest method for an amateur. Another easy method is described in the

paper on drawing, viz.: by weighing paper or thin sheet lead, cut to the outline of the figure of which the area is required, and comparing the weight with a square foot or inch of the same substance. If a delicate balance is used this method is very accurate, for very irregular figures more accurate than any method of calculation. Diagram 45 will serve to explain some methods of finding areas by calculations: The triangle A, B, C represents the half section of a vessel, and its area is found by multiplying the length of the side A C by the length of the side C B, and dividing the product by 2, this gives the area of the triangle A B C. If the half-section nearly approaches the triangular form, and the curved side from A to B is nearly straight, the following rule may be used: Divide the section into a number of equidistant ordinates, add half the sum of the first and last ordinates to the sum of the remaining ordinates, and multi-

ply their sum by the distance between the ordinates. Applying this rule to the diagram we divide the side C B of the triangle into four equal parts by parallel lines; these lines are called the ordinates, and are numbered 1, 2, 3, 4 and 5. No. 1, as shown in the diagram, is a point without lineal length, but in practice its length would be equal to the half thickness of the keel; to simplify the diagram and calculations thereon it is represented on the diagram as a point. The length of ordinate No. 1 is 0; of No. 2, is $\frac{1}{4}$ ft.; of No. 3, is 1 ft.; of No. 4, is $1\frac{1}{4}$ ft.; of No. 5, is 2 ft. The distance between the ordinates is one-half a foot. Apply the rule and we have: one-half the sum of No. 1 and No. 5 ordinates equals one foot; the sum of ordinates Nos. 2, 3 and 4 equals three feet, which, added to the half sum of ordinates 1 and 5, equals four feet; four feet multiplied by one-half foot, the distance between the ordinates, equals two feet, which is the area of the triangle A B C. When the sections

have considerable curve the foregoing rule is not accurate, and we employ Chapman's rule: Divide the section into an odd number of equidistant ordinates (five in the diagram) and to the sum of the first and last ordinates add the sum of the odd ordinates multiplied by two, and the sum of the even ordinates multiplied by four. Multiply the sum by one-third of the distance between the ordinates and the product is the required area. Applying this rule to the diagram represented by the curved line in the diagram we have ordinate Nos. 1 and 5 equal two feet; ordinate Nos. 2 and 4 equal two feet, this multiplied by four equals eight feet; ordinate No. 3 multiplied by 2 equals two feet; the whole amount equals twelve feet, which amount multiplied by one-third the distance between the ordinates (one-sixth of a foot) equals two feet, which is the required area. This diagram shows by mere inspection the correctness of the results of the different methods of calculation. The diagram also shows the comparative difference between a section triangu-

lar in shape and one similar to the curved line, the stability in either case being about the same; the triangular section carries the ballast lower down, while the curved section has more width near the water-line. The area of direct resistance is the same for both sections, but the resistance due to friction of immersed surface is about six per cent. less in the triangular section. The triangular section is the easiest and cheapest to build, and will make the strongest hull. To calculate the displacement of a vessel after the areas of cross-sections are calculated (the cross sections must be odd in number as 5, 7, 9, etc.) to the sum of the areas of the first and last section add the sum of the remaining even

numbered sections multiplied by four, and the sum of the remaining odd numbered sections multiplied by two, and multiply the sum of the whole by one-third of the common interval or distance between the sections, the product equals one-half the displacement of the whole vessel in cubic feet. Multiply by two for whole displacement, to which must be added the area of the keel and deadwood; this last sum divided by thirty-five will give the displacement in tons, not the tonnage which is an arbitrary and variable measure of no accuracy or utility except as a measure of comparison. The builder's measurement is to multiply the length, breadth and depth together, and divide by ninety-five, the product being the tonnage. To calculate the distance of the centre of gravity of the displacement from number one section: Multiply the area of each section by the number of its place from number one section; if then the sum of the areas and the quotient is multiplied by the distance between the sections the product will be the distance that the centre of gravity of the displacement is back of number one section. Note—Number two section is one remove from number one section, and is therefore multiplied by one; number three section is two removes from number one section, and is multiplied by two, etc. Other centres are calculated on the same principle. As before intimated, calculations of stability are lengthy and of little practical use. The most important calculations in yacht construction have now been given. In the next paper various details of rigging, sail making, etc., will be given, also the model of a yacht with a midship section similar to that of the celebrated yacht Sappho.

CENTENNIAL YACHT CLUB.—A new club just organized in Jersey City with twenty-five member has adopted this patriotic name. May it live for a hundred years to come.

NEENAH YACHT CLUB.—On last Tuesday, April 2, the Neenah Yacht Club elected officers as follows: S. F. Henry, Commodore; Alex. Billstein, Vice-Commodore; E. W. Clark, Fleet Captain; Chas. H. Colton, Secretary; Hugh Wilson, Treasurer; H. O. Clark, Measurer; Regatta Committee: J. N. Stone, Geo. Kingsbury, Geo. Kellogg. The annual cruise will commence about May 14 and continue one week or more. The first regatta will be about July 4, and the annual regatta will come off the first of August. The exact day was not decided on. The prospect is very good for a splendid season for yachting, as there have been eight or ten fine yachts built on the lake, and all others are under repair and improvements, which will make yachting very lively on Lake Winnebago. C. H.

SAVANNAH, GA., YACHT CLUB.—The officers and committees of this club, whose membership, we are glad to learn, is rapidly increasing, are as follows: Com., Geo. L. Appleton; Vice-Com., Wm. Hone; Sec. and Treas., F. C. Wyly; Stewards: S. P. Goodwin, J. C. Haskell, R. B. Mahersham, John W. Anderson, C. M. Cunningham, T. M. Newell, T. D. Bertody, T. L. Kinsey, C. G. Eglinger, J. Raters, J. W. Schley, Jas. T. Stewart. Finance Com.: Vice-Commodore W. Hone. Chairman; T. D. Bertody, J. Raters, John W. Anderson, C. G. Eglinger, James B. West. Sailing Com.: S. P. Goodwin, Martin Tufts, T. C. Wyly, T. L. Kinsey. Timers: L. H. Gibbs, D. C. Bacon. Measurer: J. C. Haskell.

NOTES

Capt. McClelland will be in charge of the Skylark steamer, Mr. E. S. Jeffrey owner. Commodore Baker, of the Columbia Y. C., has altered his sloop Emily. She is now 55 ft. long and 14 ft. beam. Desmond, of Peck Slip, will furnish a gig for her. Desmond is also to build a racing sloop for Mr. Richards, of 71 Wall st. She will be an open jib and mainsail craft. Length, 22 ft.; beam, 9 ft. 6 in.; hold, 2 ft. 6 in. Minum, of Gowanus, has finished Mr. James Smith's sloop. She is 33 ft. long over all, 13 ft. beam and 3 ft. 6 in. hold with 5 ft. 6 in. between decks. The amount of cabin room in this boat is something remarkable. About 3 tons of ballast will be needed to bring her down to her lines. Dr. May's new ship Julian has been put overboard. It will be remembered that her lines were furnished by A. Carey Smith, Esq., and that in general she resembles the once famous Comet turned out by Archie Smith of former days. She is deeper than usual, and will have to stow away something like $4\frac{1}{2}$ tons of pig. Her performance alongside of sister vessels will be watched with interest. Our readers will be somewhat relieved to learn that the new marine railway now building at the foot of Court st., Brooklyn, will not be allowed to fill in across the inner harbor known as Gowanus Basin, but that the city authorities are now clearing away the wreck which so long obstructed the fairway, and are also dredging out a regular channel of entrance. Yachts will therefore find as snug a harbor as before about the same old grounds. Capt. Jones, of the Intrepid, has been putting together some boats for her. Richard Wallen has in frame his seventh order this season—a racing clipper 25 ft. long. Sawyer is getting out a suit of muslin for her. She is to join the new trial Hudson River Y. C., and make things warm for the Brown, Fidget and others. Gorman's biggest undertaking, a yacht for Mr. Pearce, of the A. Y. C., will be turned out of the shop this week. Steam yacht Vedette, Philip Phoenix, Esq., was successfully launched by Ward & Stanton, at Newburgh. Fitting out—Sloops: Alice, B. Y. C., II. F. Steers, Esq., at Providence, R. I.; Kate, B. Y. C., Geo. F. Randolph, Esq., at Greenport, L. I.; Active and Gracie, at Wallabout Bay; Addie Voorbis, altered to schooner at Northport, L. I.; Alert, fitting out at Greenport; Chrystine, at Nyack; Elaine, at Providence; Eugenie, at Hoboken; Onward, at Islip; Vision, at Nyack; cutter, Volante, at Port Jefferson; Windward, at Islip; Regina, at Gowanus; Dudley, at Hyde Park; Sadie, and Vindex, cutter, will not go into commission. Schooners fitting out: Sea Witch, Frank S. Stott, Esq., at Greenport; Tidal Wave, Daniel Cook, Esq., of San Francisco, foot of Sixth street; Alarm, at Fair Haven, will be shipped; Ambassador, at City Island; Clif, at Islip; Clytie, at Stamford; Eva, at Bordentown, N. Y.; Louisa, at Hyde Park; Madeleine, at Essex, Conn.; Nettie, at Eight street, Brooklyn; Rambler, at South Brooklyn; Restless, at New London. The Columbia will fly the broad pennant of the commodore. B. Y. C. Comet will not race this season. Estelle will come out in racing trim again. Faustine, built by Poillon of Brooklyn, is receiving her engines at Cowes, Isle of Wight. Idler will go into commission to retain, if possible, the Brenton's Reef and Cape May challenge cups. Nereid is having her right lung doctored at Bergen Point. Nettie will go to Enrope. Resolute is for sale at Newport. Vesta will not go into commission. Steam yachts this, Ideal, Lurline, Skylark, Ocean Gem, Vedette, and many smaller ones, will form the steam fleet for the year. The proposed match for catamarans, at the New York Bay regatta, has received favorable attention, and quite a fleet of these double-barrelled performers will assemble.

—The Nereid Boat Club, of Brooklyn, composed of some of the best young men of Brooklyn, gave their opening entertainment April 6, at their club house. Their entertainments are always looked forward to with pleasurable anticipation, especially by the ladies.

Sea and River Fishing.

FISH IN SEASON IN APRIL.

Speckled Trout—*Salmo fontinalis*. Land-locked Salmon—*Salmo gairdneri*. White Perch.—

FISH FOR APRIL.

BLACK GNAT, OR MIDGE.—No. 13.—Body and feet black, wings subhyaline.
DARK CLARET GNAT.—No. 13.—Body dark claret, feet black, wings subhyaline.
BRIGHT CLARET GNAT.—No. 13.—Body bright claret, mixed with red fox face, feet ginger, wings of one sex hyaline, the other ochraceous.
GRAY GNAT.—No. 13.—Body dark fox, mixed with dark claret, feet gray, wings hyaline.
DARK FOX.—Nos. 10 and 11.—Body and feet dark fox, mixed with lemon colored mohair, wings subhyaline, tail three fibres of dark gray hackle.
POOR MAN'S FLY.—Nos. 9 and 10.—Body and feet, hare's ear and yellow mixed, wings slightly mottled gray, tail the mottle of the wood duck.
OLIVE GNAT.—No. 13.—Body dark olive, mixed with bright claret, feet ginger, wings hyaline.
RED FOX.—Nos. 10 and 11.—Body fox cub face, mixed with yellow, feet red (chicken red), wings pale gray or subhyaline, tail mottled feather wood duck.
BRIGHT FOX.—Nos. 10 and 11.—Body and feet brightest part of the fox, mixed with yellow, wings brightest hyaline, tail pale yellow.
BLACK HACKLED FLY.—Nos. 9 and 8.—Body orange, ribbed with gold linsel, hackle black wings, tail of the American partridge.
GENERAL FLIES.
IRIS.—No. 8.—A hackle fly, ribbed with silver tinsel, body black, wings and tail scarlet.
PEACOCK PALMER.—No. 8.—Body peacock herls, hackle black and red mixed.
GRAY PALMER.—No. 8.—Body peacock herl, dark gray hackle.
PROFESSOR.—Nos. 8 and 9.—Body bright yellow, feet golden brown, wings wood duck and mallard, dyed yellow, mixed, tail varlet tle.
QUEEN OF THE WATER.—Nos. 8 and 4.—A hackled fly; body orange ribbed with gold tinsel, hackle chicken red, wings bright mottle of the mallard.
GRIZZLY KING.—Nos. 8 and 9.—A hackle fly; body green, hackle dark gray, tail scarlet ibis, wings mottled feather of the pin-tail.

FISH IN MARKET.—RETAIL PRICES.—Our quotations are as follows: Striped bass, 20 cents; large do., 15; smelts, 15; blue fish, 15; frozen salmon, 35; green do., \$1; mackerel, large, 25; Southern shad, 50; native, 60; Connecticut River, \$1; white perch, 15; Spanish mackerel, 35; green turtle, 15; halibut, 15; badlock, 8; codfish, heads off, 8; do., heads on, 6; black fish, 15; flounders, 10; do., small, 8; eels, 18; lobsters, live, 8; do., hoiled, 10; sheepshanks, 25; turbot, 25; scallops, \$1.50 per gallon; soft clams, per 100, 30; do., large, 60; whitefish, 18; pickerel, 15; salmon trout, 15; Canada brook trout, 25; Long Island do., \$1; pike, yellow, 10; hard crabs, per 100, \$3; soft crabs, per dozen, \$3.

Of Connecticut River shad very few caught as yet. Catch of North River shad very light, and it looks as though there was to be a very slimy season. A few fresh mackerel were taken off Cape Henry last week. Large arrivals are expected daily. A monster cod, weighing sixty pounds, taken off Sandy Hook, and a salmon trout, from Wethersfield, Wyoming County, N. Y., were received by Blackford, and forwarded to Professor Baird at Washington.

The past week has been an extremely good one for business in the fish trade, the trout display having brought thousands of visitors to the fish market, and provoked an appetite for fresh sea food. Large bass, weighing from thirty to seventy pounds each, have been taken in great numbers during the past week in the Chesapeake Bay.

MOVEMENTS OF THE FISHING FLEET.—Bank arrivals at this port the past week, 13, bringing 545,000 lbs. halibut. Prices fair, but much less than in previous years when the receipts were no larger. The George arrivals, 53; catch small for the season; receipts about 1,325,000 lbs. round. The codfish do not seem to visit their old haunts in such numbers as formerly, and we have nothing to show in the way of the big stocks that used to mark the March trips.—*Cape Ann Advertiser*, April 5.

CONNECTICUT.—Hindsford, April 7.—A salmon was caught in the Farmington River in a net, which weighed about 3 pounds, this last week. No shad have been taken here yet, but one was taken in Wethersfield cove that weighed 4 pounds. A good many lamprey eels are taken in nets, which to-day are selling for fifteen cents each, retail.

LONG ISLAND. April 9.—I had the pleasure last week of a day's good trout fishing on Long Island. I arrived at the pond at 6 p. m.; weather cool and cloudy, and the water rough. To my surprise a few trout were yet rising at that late hour. As it was all but dark, I only made the circle of late hour. The pond with the boat, taking one fine fish on the "Professor," weighing 7 lb., my friend with me also taking one. Next day we commenced fishing at 8 a. m., taking sixty-four fish of fair size, but none very large. Weather clear, but very windy, varying from west to north. The favorite flies were the "Grizzly King," Coachman, Golden Splendor, Brown Adder, the "Grizzly Hackle" and Queen of the Water. They took best from 10 a. m. till 12 o'clock in the morning. The fish were bold and easily hooked, but in the afternoon they were shy and rose short. The fishing this season on the island is excellent and all report fish large and in good condition. Next month though, it will be much pleasanter. W. HOLMSTON.

—Mr. Seaman, of Ridgewood, Long Island, (not New Jersey, as was printed in our fish report of last week) has some fine speckled trout for sale; also, fishing privileges to let.—[See advertisement.]

KRESEVILLE.—Essex Co., April 5.—The Saranacs are still firmly blockaded with ice, and although the outside world

has a touch of gentle spring, its balmy breezes have not reached the Adirondacks yet, and I do not think but that we will have to wait until about May 10 before we can seek the trout safely without freezing to death. As usual, I will notify the impatient readers of the *FOREST AND STREAM* when I learn that the ice is out of the Saranac. DR. J. R. ROMEYN.

THE TROUT SEASON FAIRLY OPENED.—Ludlow Trout Co., in Ludlow, McKean County, Pa. *FOREST AND STREAM* Publishing Co., in New York city. Express. Box of trout. Thanks.

VIRGINIA—Leesburg, April 3.—Bass are being taken now daily with red worm and with the minnow by men fishing for suckers. T. W.

Strasburg, April 3.—Bass are thick ten miles below here. One man caught forty, but they often catch (i. e., one person), fifty or sixty. D. F. E.

HOW THEY SUFFER IN KENTUCKY.—Our Stanford, Ken., correspondent gives this diagnosis of the afflicted ones in his vicinity:

"Angling has broken out in these 'regional round about' in a form of mania, which is startling to the old front-door loafers, whose energy rarely inspires a rash venture into the wilds (?) beyond the town limits. Balmy west and south winds, accompanied by sunshine, have produced an epidemic of spring fever, which would, without doubt, result fatally in many cases, but for heroic treatment—large doses of country air being specific and inevitable—rod and minnow-bucket betray an intent to blend fun with physic. A few nice strings of small fish have been exhibited, but a large majority of the sportsmen find the rear entry more convenient on return, and have carefully deposited their tackle and doffed old clothes before exhibiting themselves. While a party of young anglers were lurching to-day, their valet, a negro lad, banded to be convenient to a rod when a black bass seized the bait, and he yanked out a fourteen incher—by far the largest catch of the day. One of another party submitted to our inspection a tinmouth which measured sixteen inches, and weighed two pounds—the largest we ever saw, save one captured from Cumberland River. KENTUCKIAN.

TENNESSEE—Nashville, April 4.—Rain fell last Wednesday, and the rivers and creeks are in first rate condition for fishing, parties are putting out. Big Harpeth, Turnbull and White Oak are excellent localities. The latter stream is said to be well stocked with trout (bass) and black perch, and from its inaccessibility is but little fished. There have been some good catches in the South Harpeth, including a trout weighing 2½ pounds and one of 3½ pounds. Our market is abundantly supplied with buffalo, drum, suckers and catfish from the Cumberland, and bass and perch from Reelfoot Lake, besides a good supply of salt water fish. J. D. H.

Knoxville, April 6.—Our principal sport hereabouts is with black or striped bass, which abound in the tributaries of the Tennessee River. We have mountain, or speckled trout, in the little mountain streams on the border of North Carolina, but the fish are too small to afford much sport. Mr. E. S. Sanford, of this city, and myself, spent three days in the mountains last June, and captured upward of 800, varying from 2½ to 13 inches long. We take black bass (fishing with line bait) from one to five and six pounds. MoC.

Columbia, March 30.—The creels taken of trout at Astor's Dam, in Duck River, half mile north of city, are unusually large and numerous. In three mornings' fishing (about two hours) there were taken somewhere between thirty and fifty trout, one gent catching eight, another seven, another six, weighing from one to two and a-half pounds. VAL.

FLORIDA—St. Augustine, April 4.—Drum fishing has been the sport for two weeks past. Other finny prey give us much sport. W.

—Mr. S. B. Miller has taken charge of the Minnewanken House, of Spirit Lake, Iowa, and offers extra inducements to sportsmen to visit him. Good fishing and shooting all around.

—The bone of international contention is a fish bone.—*Boston Post.*

GUT FROM NATIVE SILK WORMS.

EDITOR *FOREST AND STREAM*:

I noticed in two of the late numbers of your paper a letter from Prof. James H. Richardson, of Toronto, also one from Dr. E. Sterling, of Cleveland, in reference to silk gut made from native silk-worms, both letters referring to conversations with me on this subject. I had entirely forgotten that I had ever spoken to either of these gentlemen on this subject. I have drawn silk gut from four to six feet long, sufficiently strong for salmon fishing, from one of our native silk-worms—the larva of the *Atticus cecropia*, the largest of our native silk-worms. The moth (which is the perfect insect) is very large, the female often measuring full six inches across the wings when spread out, and of great beauty. As Dr. Sterling says, the larvae feed on the leaves of the button bush, *Cephalanthus occidentalis*, which is a favorite food for it, no doubt, as the cocoons are found in great abundance on these shrubs. But it feeds equally well on the leaves of any of our cultivated or wild plum trees, as it does on the leaves of some other shrubs and trees. But the button bush and plum, I think, are its favorite food; but it never feeds on the leaves of the sassafras, as stated by Dr. Sterling. It is another native silk-worm, and a very fine one, that feeds on the sassafras, the *Atticus promethes*, named after one of the fabled Cyclops of the Greeks. The larva, or worm, of the *Atticus cecropia*, spins an immense cocoon, the inner shell of which could be reeled. The outer shell is rather thin, and the space between the outer and inner shell is filled with strong floss silk.

This moth has a wide and extended habitat. I have found its cocoons from Vermont to Ohio, and, no doubt, they are abundant in Canada, as Dr. Sterling states. In order to rear this silk-worm, the cocoon should be secured in the fall of the year, and kept in a cool room until the leaves of such trees as you wish to feed the worms with begin to make their appearance, at which time the moths will leave the cocoons. As soon as the sexes conjugate—which will take place very soon after they leave the cocoons—the females (which are known by being the largest, with smaller antennae) should be placed in pasteboard boxes, where they will deposit

their eggs, and the young larva will make their appearance in ten or twelve days, the incubation being hastened or retarded as the weather is warm or cold. They should be fed for some time in the pasteboard boxes, but after they attain considerable size they may be placed on such trees as you intend they shall feed on. I much prefer the plum tree. Just before they spin their cocoons, they cease to feed, which is the time to spin, or draw, the silk gut, the process being the same as in drawing it from the ordinary Italian silk-worm. That process has already been described in your paper.

Very truly yours,
Bedford, O., March 30, 1878.

T. GARLICK.

THE BLACK BASS ROD.

CYNTHIANA, Ky., March 14, 1878.

EDITOR *FOREST AND STREAM* AND *ROD AND GUN*:

Several years ago, while living in Wisconsin, I wrote a series of articles on black bass fishing for the *FOREST AND STREAM* over the nom de plume of "Oecumomoc," and I then expressed the opinion that the black bass would eventually become the game fish of the United States. In order to divest the sport of black bass fishing—as it then existed—of some of its disagreeable features, and give it a higher place in the catalogue of noble sports, I described at some length the proper rod, reel, line, hook, etc., and mode of using them in order to render this not only feasible but practicable.

The said articles were afterward revised for Hallock's "Sportsman's Gazetteer," under the head of "Black Bass," in the chapter devoted to Western Fishing, and I am constrained to say, right here, in strict justice, that no lover of the rod, gun or dog, or student of natural history, should be without this invaluable hook: it is an inexhaustible mine of information pertaining to these subjects, and information, moreover, of an entirely practical nature.

At the time when the articles mentioned were written not much attention or importance had been given to the subject in the various hooks on fishing, and it was an impossibility to purchase a suitable rod at the tackle stores. This was the more surprising as the black bass inhabited so many of the waters of the Union, from New England to Florida, and from Maryland to Missouri. He was, moreover, the acknowledged peer of the brook trout for gaminess by those who knew him best; and it was "a consummation devoutly to be wished," that as much skill should be displayed in his capture, and as elegant and suitable tackle employed for the purpose as in the case of his speckled rival. I therefore took some pains to describe, under the caption of "The Coming Black Bass Rod," what I considered from long experience to be the proper rod. Mr. C. F. Orvis, of Vermont, an ardent fisherman, at once saw the point and began the manufacture of the rod from those suggestions, and I understand that he has sold a very large number of them. Other manufacturers seeing the necessity for a "new departure" from the old beaten path, also began to make a short and light black bass rod, more in accordance with the spirit of the age, and the demands of their customers. This, I consider a great triumph for the *FOREST AND STREAM*, for to its columns alone is due the credit of completely reconstructing the black bass rod and of replacing the former long, heavy and clumsy affair by the elegant, light, short and pliant rod of the present day. The black bass rod for bait fishing should be from 8 to 8½ feet long, and should weigh from 8 to 9 ounces—no more, and not much less. It should be well balanced, pliant (not withy) and elastic. Practically it would, of course, be better if constructed of one entire piece, but this could not be done with any kind of wood and preserve the requisite conditions of weight, balance, pliancy, strength and elasticity. The natural cane or bamboo is the nearest approach to it, in its natural and entire state, but this lacks balance, pliancy and elasticity, three of the most important factors. The rod for general convenience, portability and ease of being repaired, should be made in three pieces, with ferruled joints; the butt should be ash, and the second piece and tip constructed of lancewood; this forms the best known combination of material for a durable and satisfactory rod. The standing guides on the butt and second piece should be light and made of brass wire, either nickel or silver plated; there may be guides of the same on the tip or rings, I incline to the latter. For my own use I prefer a rod made of two pieces, each about four feet long, the hut of ash and the top of lancewood; this, however, adds somewhat to the expense. I am also partial to the spliced joint, but this necessitates too much carelessness in putting together for most anglers. Mr. Orvis, however, makes the best ferruled joint I have seen, in the fitting of which he discards the dowel and boring entirely. He is the only rod maker, so far as I know who agrees with me in this respect. The boring not only weakens the joint, but the tapering dowel, acting like a wedge, will cause the joint to separate by the continual springing of the rod.

A few years ago a gentleman in this State, living, I think, in Lexington, proposed in the columns of the *FOREST AND STREAM* the "parasol" joint, which occasioned some sarcastic and humorous remarks and comments. This, however, is "not so bad as it seems," for if the connecting hinge was nicely fitted, and the single, investing ferrule properly adjusted, it would be as good as any ferrule joint for use; still I do not fancy it, and a rod would be rather more difficult to repair than with the usual style of joint.

Mr. Orvis informs me that some of his customers ordered rods, with the butt extending below the reel clamps a foot or more, so as to reach under the elbow and thus form a *point d'appui*. This demand is founded upon laziness, carelessness, or pure eussedness, which was first induced by using the old style rods, which were so heavy and long as to require either this support, or, what was worse, the holding of the rod with both hands. Now, the object of the modern black bass rod is to dispense entirely with this ungraceful and clumsy style, and enable the rod to be used with the hand alone as in trout fishing. I sincerely hope that my brother anglers will not thus handicap their skill, nor encourage this needless extension of hut. It will be well to remember in this connection, that no excellence is gained but by great labor, and no skill attained but by careful practice. There may be born poets, but I doubt if there are born fishermen—the love may be innate, but its confirmation requires patience, perseverance and elbow grease. J. A. HENSHALL, M. D.

FISHING REELS.

EDITOR *FOREST AND STREAM*:

A fishing reel is made in accordance with the special service required of it, the objects of said service being two-fold. The first and most important is the proper delivery of the bait in a manner and at a distance commensurate with the mode of fishing; and the second is to play and land the fish after he is

hooked, or to reel the line for another cast. The reel which practically fulfills these conditions with the greatest ease and facility—in the method of fishing practiced—is the best reel to use; thus in fly-fishing

THE CLICK REEL.

is unexcelled. It is the simplest form of reel, from the fact that the service required of it is simply a slow and gradual lengthening of the line with each subsequent cast; the delivery of the fly being accomplished by pulling off from the reel a few additional feet of the line after each cast until the desired or maximum distance is reached, while the click offers just enough resistance to the reeling of the line to allow this to be done without confusion or over-running. The handle or crank is connected directly with the axle or shaft, and, consequently, "reeling in" the line would be slow work were it not obviated by the reel being made very narrow so that the coil of line upon the shaft enlarges rapidly, and the reeling is thus accomplished with greater facility. As the click reel is intended to "take care of itself" in casting, it is very properly placed at the extreme end, in which position it adds much to the balance and working of the rod. The click reel should always be used underneath the rod.

THE ORVIS REEL.

This is a click reel, but narrower, and therefore takes up line more rapidly. It is perforated freely to make it lighter, and to favor the drying of the line and the escape of sand or dirt. It answers admirably for fly-fishing, and it is just the reel in bait-fishing for black bass for those who cannot control the casting of a multiplying reel; the click exerts just the right amount of resistance for short casts, from 30 to 75 feet, though the click should be evenly tempered to stand this rapid work. I consider it the best reel manufactured for the price.

THE MULTIPLYING REEL.

This reel is a decided improvement on the old single action English reel or winch. It is made of metal or vulcanized rubber, and of various styles and sizes, from a striped bass reel to a perch reel. In shape and construction it differs materially from the click reel, having a different office to perform, or rather the same object—the delivery of the bait—to perform in a different manner. Being intended for natural bait-fishing it requires an easy running and freely rendering action in order to deliver the bait as far as possible at a single cast. As there is no click to control the running off of the line, the thumb must be used for this purpose, by effecting a gentle and even pressure upon the spool, and for this reason the multiplier is made much wider than the click reel, or of the barrel or drum shape. In its construction a small cog or spur wheel is placed at one extremity of the axis or shaft, into which a larger cog wheel is fitted, and to the latter is attached the handle or crank. One revolution of the handle produces two or more revolutions of the central shaft. The reel most generally known and used is the "New York Multiplier," which is manufactured for the trade in large quantities, with the retailer's name stamped on one end. It is called by some of the correspondents of the *FOREST AND STREAM* the "balance reel," from the fact, I presume, that it has a balanced handle, which by some is thought to add to the rapid working of the reel; but this fancied advantage exists in the imagination only; it causes the gearing to wear out, and the handle soon becomes shaky and wobbling. A simple crank handle is better.

THE FRANKFORT REEL.

This reel is made by B. C. Milan at Frankfort, Ky., and is frequently referred to as the "Meek," "Meek and Milan" and "Kentucky" reel. It has been manufactured to a limited extent for thirty years, and has been used by many of the best anglers of the South and West for that length of time, but it has only been brought to the general notice of the angling fraternity through the columns of the *FOREST AND STREAM*, and first, I believe, through a communication of mine a few years ago. It is as great an improvement on all multiplying reels as they are upon the old single-action reel. It multiplies four times, is perfect in its action, and with it an expert can cast a minnow from 75 to 150 feet. In shape it is not a bit too wide (as has been suggested) and those who cannot cast without tangling or snarling the line, or who cannot reel the line evenly upon the spool, must look for the fault in themselves and not in the reel. *Me judice*, I consider it the best reel in the world. The "alarm" is intended for an alarm only, and should not be used as a click to retard the rapidity of the reel's action, for this it can do to a very limited extent only, and that to the eventual detriment of the reel. By using the drag or rubber, it answers tolerably well for fly fishing. Indeed, I know some veteran anglers in Cincinnati who have frequented the Nepigon for the past ten summers, who prefer it to any other reel, and they are good fly fishers, too.

NO REEL.

Those who from any cause cannot manage a multiplying reel might adopt the "Nottingham" style of angling, which is much in vogue in England, in which the reel is dispensed with. The line is made fast to the butt of the rod, and carried through the guides or rings. When ready for cast, the line is pulled back through the guides and laid in coils at the feet of the angler, leaving twelve or fifteen feet of line hanging from the tip of the rod. Our angler then grasps the line a few feet from the sinker and bait, and gives it a few rapid whirled around his head and casts it as far as he can, the rod in the meantime being held firmly in the left hand, and pointing toward the water. Longer casts can be made in this manner, and the line retrieved more rapidly, than by the aid of any reel, but to the expert reel angler the game would not be worth the candle. We can teach England something in regard to reels as well as rifles.

POSITION OF THE REEL ON THE ROD.

In order to allow the thumb to be used in controlling the cast, a multiplying reel should never be placed less than six inches from the extreme butt of the rod, and should be so placed as to be underneath when reeling up the line. I am aware that some prefer it on top, but the former mode is preferable for the following reasons: The weight of the reel naturally takes it under the rod, enabling the rod to be held steadier when reeling the line or playing the fish; the strain of the line falls upon the guides, causing a uniform working of the rod; the line is more easily reeled up, and it was intended to be used in this manner. The left hand should grasp the rod immediately over the reel, the thumb and forefinger embracing the rod above the reel and as close to it as possible, the ring and little fingers clasping the under surface of the reel, while the middle finger is left free to guide the line on the spool and prevent bunching. I have noticed that all anglers who prefer to have the butt of the rod extending a foot or more below the reel, always use the reel on top, and when reeling in a fish, they invariably rest the butt against the stomach. *Ohe! jam satia.* J. A. HENSHALL, M. D.
Cynthiana, Ky., April 2, 1878.

Tiffany & Co., Silversmiths, Jewellers, and Importers, have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they prepare special designs for similar purposes. Their **TIMING WATCHES** are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. **TIFFANY & CO.** are also the agents in America for Messrs. **PATEK, PHILIPPE & CO.**, of Geneva, of whose celebrated watches they have a full line. Their stock of Diamonds and other Precious Stones, General Jewelry, Artistic Bronzes and Pottery, Electro-Plate and Sterling Silverware for Household use, fine Stationery and Bric-a-brac, is the largest in the world, and the public are invited to visit their establishment without feeling the slightest obligation to purchase.

SPORTSMAN'S SCORE-BOOK FOR GLASS-BALL TRAP SHOOTING

In the spring traps now used to throw glass balls for practice shooting, sportsmen have a mechanical contrivance which should entirely do away with the "shades" which arise in trap-shooting, as the glass ball goes far more rapidly in the direction desired by the trap puller, or in which the trap is set. In bird shooting from a trap—which many dislike on account of the well-known objection to it—there is a large element of chance, as one man may have good, slow quartering birds, while his opponent may get strong "in-coming" or "tail-birds," making the match uneven, simply because the one has much easier shot than the other, and is not liable to miss or have his birds drop outside the boundaries. In order to derive the greatest possible benefit from trap shooting, and at the same time test the marksmanship of any number who may be engaged, it is necessary. First, that not only should the trap throw balls in different directions, but that each person shooting should have in every ten shots the same angles at which the others shoot, so that no one may be favored by chance or by the trapper. Second, that a record be kept of each person's hits and misses and the angles on which they occur, so that one may practice intelligently, knowing on what angles he needs more proficiency. (It is believed that the plan adopted for scoring, which has been copyrighted, together with all arrangements, whether of letters, or figures, characters or plates for recording shooting by angles) will be found all that is desired.)

For good practice the trap should at all times be bid from view of the person shooting—by screen or otherwise.)

This system not only records the angles so that each person competing scores the same shots as all the others, but it also records the angles on which he fails to break his balls, so that he may practice alone and perfect himself where he fails most.

We have carefully examined "The Sportsman's Score-Book for Glass Ball Trap Shooting," by D. E. HOLMES, and can confidently recommend it as being the most perfect system we have seen for keeping a complete record of a shooting match, and equalling the object of those engaged in regard to the direction in which the balls are thrown, by giving each person the same angles at which all the others shoot. The book is well printed on good pencil paper, and contains full instructions together with—

BY CHARLES HALLOCK,

EDITOR OF "FOREST AND STREAM," AUTHOR OF THE
"FISHING TOURIST," "CAMP LIFE IN FLORIDA," ETC.

NEW YORK:

The book is a complete manual for sportsmen. It gives every sportsmanlike method for capturing every known game animal, bird and fish in North America.

It designates the proper charges for guns for each kind of game, the various kinds of decoys and blinds, and baits and tackle for the fish.

It gives over 4,000 localities where game and fish may be found, specifies the game found in each locality, the best accommodations and the best route to get there. (The preparation of this Directory was in itself a work of great magnitude.)

It gives the scientific name and specific characteristics of each species it describes, with the *Habitat* and breeding season of each—a most valuable contribution to science.

It describes 297 varieties of edible fish alone, that may be taken with the hook; 50 varieties of ducks; 50 varieties of snipe or waders, and the different methods of shooting each.

Its instructions for capturing large game are very minute, and the chapters on woodcraft, outfitting and camping have been pronounced by "El Cazador," of Los Angeles, California, to be simply complete.

Every kind of dog used for sport is designated, and his points for bench judgment fully given. The chapters relating to selection, breeding, rearing, breaking, care and diseases, comprise a seventh part of the volume. There are 71 prescriptions and recipes given under the revision of the best modern canine therapeutists.

It is in itself the most concise, accurate, instructive, sensible and comprehensive work ever written upon the dog and his diseases. Any physician can administer the prescriptions with perfect confidence in their safety and efficacy.

It contains very useful recipes and remedies for wounds, bites, poisons, illness, and emergencies of all kinds; for cleaning, repairing, and preserving every implement used for sport; for selection and use of every kind of boat, employed by sportsmen; a reference list of several hundred books in request by sportsmen, and a directory where to buy outfitting goods.

It instructs in taxidermy, and tells how to preserve and mount specimens of animals, birds and fish.

Dog Paths to Success.

A PRACTICAL GUIDE FOR SPORTSMEN AND TRAINERS.

FULL INSTRUCTIONS FOR BREAKING AND TEACHING DOGS FOR THE FIELD.

To which are added the standards for judging Pointers, Setters and Cocker Spaniels, with various hints concerning the Cooker, with other miscellaneous matter.

CHOKE-BORE GUNS,

Tried on Game in America.

Supplied by H. C. Squires, American Agent,
1 CORTLANDT ST., NEW YORK.

The Gun of the Future.

Samples of the Hammerless Gun now on exhibition, and orders taken by our agent. Guns to be delivered June 1.

See the Following Testimonials:

SEN—It is a pleasure for me to inform you of my high appreciation of the 10-lb. Greener breech-loader purchased of you last winter. I consider choke-boring, if skillfully done, as the greatest improvement in fowling pieces since the introduction of the percussion cap. It gives the maker complete control of the pattern, and greatly increases penetration. To prove this, I will give you the performance of this gun. The 32-inch 10-gauge barrels, charged with 4½ drachms of powder and 1½ ozs. No. 6 English chilled shot, give patterns ranging from 235 to 330 pellets in 30-inch circle at 40 yards. The same charge of powder and 1½ oz. No. 4 American shot given 160 to 175 pattern, with penetration which kills ducks at 60 to 70 yards like a stroke of lightning. It is a characteristic of the choke-bore to show its greatest superiority in the large sized shot. What I am about to say will perhaps surprise you as much as the performance surprised me. On trial of the 12-gauge 32-inch modified choke-bore barrels, with 3½ drachms of powder and 1½ oz. of shot, I got about the same pattern and spread of shot at 25 yards as with the full choke 10-gauge barrels at 40 yards, with tremendous penetration. This is just the performance required of a gun for thick cover, in which you generally find ruffed grouse, woodcock and quail, these birds being killed, with few exceptions, at from 15 to 24 yards.

Gunpowder.

THE HAZARD POWDER CO., MANUFACTURERS OF GUNPOWDER.

Hazard's "Electric Powder."

Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. only.

Hazard's "American Sporting."

Nos. 1 (fine) to 6 (coarse). In 1 lb. canisters and 6½ lb. kegs. A fine grain, quick and clean, for upland prairie shooting. Well adapted to shot-guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. canisters and 6½ and 12½ lb. kegs. Burns slowly and very clean, shooting remarkably close and with great penetration. For field, forest or water shooting, it ranks any other brand, and it is equally serviceable for muzzle or breech-loaders.

Hazard's "Kentucky Rifle."

FFG, FFG, and "Sea Shooting" FG, in kegs of 25, 12½ and 6½ lbs. and cans of 5 lbs. FFG is also packed in 1 and ½ lb. canisters. Burns strong and moist. The FFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard rifle powder of the country.

Superior Mining and Blasting Powder. GOVERNMENT CANON & MUSKET POWDER. ALSO, SPECIAL GRADES FOR EXPORT, OF ANY REQUIRED GRAIN OR PROOF, MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's Agents in every prominent city, or wholesale at our office.

85 WALL STREET, NEW YORK.

Lafin & Rand Powder Co.

No. 26 MURRAY ST., N. Y.

Sole Proprietors and Manufacturers of

Orange Lightning Powder.

No. 1 to 7, strongest and cleanest made, in sealed 1 lb. canisters. Higher numbers specially are recommended for breech-loading guns.

Orange Ducking Powder,

For water-fowl, strong and clean. No. 1 to 5 in metal kegs, 6½ lbs. each, and canisters of 1 and 6 lbs. each.

Orange Rifle Powder.

The best for rifles and all ordinary purposes. Sizes, FG, FFG and FFG, the last being the finest. Packed in wood and metal kegs of 25 lbs., 12½ lbs. and 6½ lbs., and in canisters of 1 lb. and ½ lb.

All of the above give high velocities and less resumption than any other brands made, and are recommended and used by Capt. A. R. BOGARDUS, the "Champion Wing Shot of the World."

BLASTING POWDER AND ELECTRICAL BLASTING APPARATUS. MI ITARY POWDER of all kinds on hand and made to order.

Safety Fuse, Frictional and Platinum Fuses.

Pamphlets, showing sizes of the grain by wood cut, sent free on application to the above address.

H. M. QUACKENBUSH, Patentee and Mfr, Herkimer, N. Y.

Hart's Sportsman's Favorite Metallic Shells. FOR BREECH-LOADING SHOT GUNS.

These Shells are easily loaded, and the caps easily extracted from inside. Head solid and much thicker than any Shell now made, giving a solid seat for cone or snail, which prevents it from driving through or springing away, thereby causing misfires. The Cone is made of nickel, and fastened solid in its place. Neither rusts nor corrodes fast, like movable snail made from steel. The Nickel Cone also prevents misfires when a cap has been left on shell for a few days, which is liable to occur either in steel or iron. These Shells are finely finished, and made any length ordered, from 2½ to 3½ inches. Shells and Loaders and Descriptive Price-Lists can be obtained from all the leading Sportsmen's Houses throughout the country.

FROM CAPTAIN BOGARDUS, CHAMPION WING-SHOT OF AMERICA.
MESSRS. GEORGE E. HART & Co.—Gentlemen: The fifty Shells I received from you to-day suit me better than any I have ever used. They are stronger and better in every respect, and I shall use them in all my shooting hereafter.
Yours truly,
A. H. BOGARDUS.

NORRIS RODS

Parties wishing to procure one or more of the above make of Rods can do so by applying in person or by letter to

RICHARD NORRIS, 2,550 Cray's Ferry Road, Philadelphia

Comprising four Selmon Rods, two Trout Rods (Trout), thirty Trout Rods of Split Bamboo, Lance and Iron Wood and Greenheart, with extra tips of split bamboo and extra middle joints. Some of the above in Red Cedar cases; a convenient form of carrying them to prevent injury to the tips. Any information in regard to the above will be furnished on application to the above address April 14

Auxiliary Rifle.

SHELTON'S Auxiliary Rifle Barrel for Breech-Loading Shot-Guns.

This barrel can be placed in a gun ready for use in a second of time with the same ease as a cartridge, and can be removed just as expeditiously. There is no wear on the rifle barrel, nor on the shot-gun, and it cannot get out of order. With this Auxiliary Barrel, which weighs about one pound, almost instantly a breech-loading shot-gun can be converted into a most accurate rifle. The AUXILIARY BARREL will fit any standard make of gun of 10 or 12-calibre—calibre of rifle 32, 38, or 44, as desired. Length of barrel, twenty inches. Any central-fire metallic cartridge can be used. Also, the EVERLASTING SHELL or shells can be loaded by the person using the rifle. Send for a Circular and Price List.

Musical Instruments.

HIGHEST HONORS

AT THE

Centennial World's Fair, 1876!

THE

SHONINGER ORGAN

PRONOUNCED UNANIMOUSLY AS THE
Best Instruments.

Their comparative excellence is recognized by the Judges in their Report, from which the following is an extract:

"The B. SHONINGER ORGAN CO.'S exhibit as the best instruments at a price rendering them possible to a large class of purchasers, having a combination of Reeds and Belts, producing novel and pleasing effects, containing many desirable improvements, will stand longer in dry or damp climate, less liable to get out of order, all the boards being made three-ply, put together so it is impossible for them to either shrink, swell or split." THE ONLY ORGANS AWARDED THIS RANK.

There are 56,000 of our instruments in this and the European countries in use, and they are so made that they will keep in tune, and stand any climate. They contain a magnificent Chime of Bells, tuned in perfect harmony with the Reeds, producing wonderful effects. The Music Rack, when tuned forward, will make a splendid writing desk, with our Book Closets and Swinging Lamp or Flower Brackets, with a fine stool boxed free with each Organ, makes the SHONINGER ORGANS the most substantial, convenient and perfect Organ.

ESTABLISHED 1856.

"THE FISHING LINE."

Brook Trout, Grayling and Black Bass Fisheries
 of Northern Michigan,

VIA THE

Grand Rapids & Indiana RR

(Mackinaw, Grand Rapids & Cincinnati Short Line.)

Sportsmen who have cast a fly, or trolled a spoon
 in the

Grand Traverse Region

will come again without solicitation. All other lovers
 of the Rod are invited to try these waters, wherein
 the fish named above, as also Muscalonge, Pike and
 Pickerel abound.

In no other streams east of the Rocky Mountains
 is the famous AMERICAN GRAYLING found in
 such numbers.

BROOK TROUT Season opens May 1.
 GRAYLING Season opens June 1.
 The Sportsman can readily send trophies of his
 skill to his friends or "Club" at home, as ice for
 packing fish can be had at many points.

TAKE YOUR FAMILY WITH YOU. The scenery
 of the North Woods and Lakes is very beautiful.
 The air is pure, dry and bracing. The climate is
 peculiarly beneficial to those suffering with

Hay Fever and Asthma.

The Hotel accommodations are good, far surpass-
 ing the average in countries new enough to afford
 the finest of fishing.

On and after June 1 Round Trip Excursion Tickets
 sold to Points in Grand Traverse Region, and attrac-
 tive train facilities offered to tourists and sportsmen;
 also Mackinaw and Lake Superior Excursion Tickets.
 Dogs, Guns and Fishing Tackle Carried Free, at
 owner's risk.

Camp Cars for fishing parties and families at low
 rates.

It is our aim to make sportsmen feel "at home"
 on this route. For Tourist's Guide, containing full
 information as to Hotels, Boats, Guides, etc., and
 accurate maps of the fishing grounds, send to

A. B. LEET, G. P. A.,

 and Sportsmen's Association," for an unusu-
 ally fine display of Duck, Mole-skin and
 Leather

HUNTING SUITS,

which attracted great attention and were
 much admired by all Sportsmen.

THE BOSTON

SHOOTING SUIT.

Manufactured only by

G. W. SIMMONS & SON,

BOSTON, MASS.

NEW YORK AGENTS:

Fowler & Fulton,

300 BROADWAY,

The Best in Use.

ONLY ONE QUALITY MADE, AND THAT IS
 THE VERY BEST.

Flexible Waterproof, Tan-Color Duck.

Each article—coat, trousers, vest and hat
 cap—has the name and manufacturers' ad-
 dress stamped upon it, and no suit is genuine
 without it bears this imprint.

We make no discount except to the trade.
 The price of the suit complete is \$13.

The material is of the best quality of duck,
 waterproofed by a patent process. The color
 is that known as "lead grass shade."

The seams and pocket corners are copper-
 riveted, and nothing is neglected to make the
 whole suit complete in every way.

This is what one of our best sportsmen says
 of it, writing from camp: "Although I had
 been nearly eight months under incessant rain,
 laboring and striving along under adverse
 circumstances, yet I found myself compara-
 tively dry, and my clothes without a tear. For
 the benefit of our brother sportsmen, let me
 advise one of Messrs Simmons' (of Boston,
 Mass.) Waterproof Suits. Oh! what a relief
 it was to find one's tobacco was dry, and that
 one could light a pipe; that you could laugh
 at your miserable friend, who stood shivering
 and shaking as if he had the palsy; and then,
 next morning, oh! what fun it was to see him
 mending his clothes, while I had not a tear to
 complain of! Ventilation, that great bugbear
 of waterproof suits, is legislated for in the
 most ingenious manner. No sportsman should
 fail to supply himself with a suit which is at
 once cheap, practical, and will last an almost
 indefinite time."

Our Flexible Tan-Colored Water-Proof
 Leather Coats, Breeches, Vest, Leg-
 gings and Caps are considered the finest
 things ever made.

SCHUETZENFEST

The FOREST AND STREAM AND ROD AND GUN having given a gold medal for team shooting at the

SCHUETZENFEST

of the Sharpshooters' Union of the United States of North America, the Executive Committee of this Union takes pleasure in informing their American friends that they will make all arrangements for team shooting for this medal. The match will take place at the Schuetzen Park, Union Hill, on

Monday, June 24, 1878,

at 11 A. M. Each team to consist of eight men. Entrance fee, \$15 per team. The team making the highest score to win the Forest and Stream and Rod and Gun Medal. The entrance fee may, after deducting cost of markers, will be divided among the teams, pro rata. All the members of such teams must be of the same society, and must have been members of it for ninety days previous. The entrance fee is to be paid on or before June 10, 1878, to Mr. F. BARNBURG, Treasurer of the Sharpshooters' Union, No. 100 Greenwich street, N. Y. Any rifle club or shooting society of the United States will have the privilege of sending their teams without being members of the Union. Any communication directed to the secretary will be promptly replied to. GEO. AERY, President, J. H. BEHRENS, Cor. Sec., 31 Bowery, New York.

Send for Illustrated Catalogue.

FOWLER & FULTON, General Agents, 300 Broadway, N. Y.

Fisher's Muzzle-Loading Long-Range Match Rifle.

Interchangeable Grip and Heel Verner Scale, and Wind-Gauge Front Sight, with Spirit Level. Fine English Walnut Pistol-Grip Stock.

This Rifle requires no patent muzzle to load it. Uses the same bullet as the Sharps and Remington rifles. Loads the same as breech-loaders, where they do their best work, viz., from the muzzle. As Perry's Score-book says: "No shells to cart around and pay for. Can be used at one-half the expense of the breech-loader. With powder and balls always ready for a day's sport." Every rifle guaranteed. Breech-loading rifles at manufacturers' prices. All long-range rifles sighted and tested at Creedmoor without extra charge. Agent for P. WEBLEY & SON'S BREECH-LOADING SHOT-GUNS. Send for Circulars. H. FISHER'S Illustrated Catalogue and Score-book for Rifle Practice, price 25 cents.

HOMER FISHER, 260 Broadway, Cor. Warren St., New York.

Bogardus' Patent Rough Glass Balls and Glass Ball Traps.

These Traps are the only ones that give satisfaction, as they are simple of construction, easily set, and not liable to get out of order, and they throw the ball in a manner that more closely resembles the flight of a bird than any other trap in the market. The Patent Rough Glass Balls are made of uniform weight and thickness, and have a corrugated surface that strengthens the ball for shipment to any part of the country, prevents the glancing of shot, and thereby insures the breaking of the ball when hit. CAPTAIN BOGARDUS was the first to introduce the ROUGH BALL, and at a price far below the smooth ball at that time.

Balls and Trap can be ordered through all Gun Dealers. Liberal discount to the Trade. MY IMPROVED TRAP (warranted), which will throw a ball in any direction from the shooter at the option of the puller, is now ready for the market. Price \$8. Old style, \$6. Parties buying glass balls will receive, in each barrel containing 300 balls, score book and rules for glass ball shooting, containing 40 pages.

HEADQUARTERS FOR BALLS, HAGGERTY BROS., 10 Platt Street. FOR TRAPS, HART & SLOAN, Newark, N. J.

Second and enlarged edition of "Field, Cover and Trap Shooting," by A. H. BOGARDUS, containing instructions for Glass Ball Shooting, and chapter on breeding and breaking of dogs by Miles Johnson. Price \$2, by mail, postage paid. Address, Capt. A. H. BOGARDUS, Elkhart, Logan Co., Ill. Dec 6 11

IRA A. PAINE'S

FEATHER FILLED GLASS BALL.

PATENTED OCTOBER 23, 1877.

The "Standard" Ball.

The Bohemian Glass Works would respectfully call the attention of all dealers in Glass Balls to the fact that the Paine Patent Filled Ball is the STANDARD AND ONLY BALL MADE TO A SCALE, therefore we would respectfully caution the dealers against laying in a stock of unsalable articles for the Spring Trade, when you can purchase the Best Ball ever made at prices less than is charged for other inferior balls.

No other ball affords the PLEASURE of the Feather Filled Ball, and no other Ball is as beautifully made. It will break in every instance when hit by shot, and is sufficiently strong to prevent breakage either by transportation or falling on the grass.

Every ball is weighed and examined, then packed with the greatest care, in barrels of 300. Send for price list. Special inducements to the trade.

HEADQUARTERS BOHEMIAN GLASS WORKS, 214 Pearl Street, N. Y.

W. W. Greener's Champion Treble Wedge Fast, Breech-Loader.

THE WINNING GUN.

At the International pigeon shooting, Monaco, Feb. 1878, the Grand Prix de Casino, an objet d'art valued at £103, and a money prize of £105, the greatest prize ever shot for at Monaco, was competed for by sixty-six of the best shots of all nations, and won by Mr. Cholmondley Pennell, with a full-choke bore Wedge-Fast Gun by W. W. Greener, killing 11 birds out of 12 at 28 yards and 1 foot and 2 1/2 yards. He also won the second event, killing 6 birds in succession at 33 yards, making a total of 19 birds out of 20. This is acknowledged to be the best shooting on record. The winning gun at the choke-bore match, 1877, beating 17 guns by the best London makers, and winning the silver cup, valued at 50 guineas, presented by Mr. J. Purdey, the gunmaker.

The winning gun also at Philadelphia, 1876, in the pigeon shooting match between Capt. Bogardus and Mr. South for \$500 a side, South killing 86 birds out of 100, using one barrel only.

The winning gun also at the great London Gun Trial, 1875, beating 102 guns by all the best makers of Great Britain and Ireland. THE PATENT TREBLE WEDGE FAST BREECH-LOADER is the strongest and most durable ever invented, and the most successful gun of the period. Patented in the United States, Oct. 3, 1873; No. 163,328. BEWARE OF IMITATIONS OR IMITATIONS.

19 Beaver St., (up stairs) N. Y. City. For his lists of TROUT FISHING OUTFIT offered for

FIVE DOLLARS, (\$5), Retail Price from \$5 to \$10 TEN DOLLARS, (\$10), " " " \$10 to \$20

To clubs who may desire to purchase either of the lists offered, or any amount equal to either of them I will donate, as follows, an extra package for every 10 lists sold:

\$17 Trout Fly Rod for every 40 of the \$5 Lists sold.

\$17 " " " 20 " " \$10 "

\$30 " " " 40 " " \$20 "

The best assortment ever offered for the money.

Every article guaranteed. Sent by mail to any address on receipt of money, or expressed C. O. D.

MANN'S

Trolling Spoons.

Our Trolling Spoons have been sold by the Trade, and used by the best fishers in the United States for fifteen years.

We have continually added, year by year, new spoons, such as by actual experiment and trial have proved the best Spoons for taking fish. We now manufacture 50 different kinds.

OUR PERFECT REVOLVING

has proved to be the best Trolling Ball ever manufactured.

Dealers will please send for catalogue. We prefer the dealers to sell these Spoons at retail, but if not to be found at your fishing-tackle stores they will be sent by mail for one dollar each by address.

JACK IN THE SADDLE.

"My Kingdom for a Horse, Sir."

I'm a sailor and I've pitched and tossed upon the troubled ocean
For several years and visited the shores of many a land,
And wind may blow, and storm may rage, I care not for the motion,
But how to ride on pony-back I cannot understand.

Not long ago I thought I'd try, and having found a stable,
"I want a horse," said I, addressing one who chewed a straw,
And why all hostler men do that, to find out I'm not able.
"Here's one," says he, "a pretty thing that hasn't got a flaw."

How to get upon his back at first I was quite puzzled,
For he kept going round and round and throwing out his feet,
But soon I seized the leather thong with which he had been muzzled
And sprang aloft and off he flew full gallop down the street.

"Look out," cried all the people, "here's a sailor on a filly,"
"Stop," shouted out the hostler man, "your stirrups are too long;"
But I could neither stay nor speak, but went on willy nilly,
Like some good ship without a helm when tide and wind are strong.

I rushed into the market and upset a woman's stall there,
And scattered all the butter, fowls and fruit about the place,
I clung hard to the horse's mane or I'd have had a fall there,
But as it was the noise did but increase my charger's pace.

I next dashed through a herd of swine, young piglings and old grun-
ners,

And drove into a crockery shop a pair of blundering sows;
Then having gained the country I beheld some hounds and hunters,
And hoped that they would pass in time to clear my pony's bows.

Alas! he heard the "Vlew hallo" and turned the chase to follow,
Fast bolting on the starboard tack, and clearing hedge and ditch,
As swift as wind through meadow, shady copse and ferny hollow,
While every moment from his back I feared that I should pitch.

My hat was flying far behind, my stirrups idly swinging,
Like drowning man to floating wreck I held on by his mane,
The hounds did merrily give mouth, the huntsman's horn was ring-
ing,

And every step my gallant steed upon the pack did gain.

"Come back, you sailor chap, come back," I heard a farmer calling,
"Be's you a going to trample down the hounds beneath your feet?"
'Twas all in vain, they might have spared their shouting and their bawling,

I could not stay my fiery steed, I could not check his heat.

For all this time with all my might the hridge I'd been sawing,
But 'twixt his teeth he'd got the bit and didn't care a fig,
I'd coax'd him and I'd yelled at him, he didn't mind my jawing,
But seemed to think it a great joke to lead me such a jig.

At last he tried a flying leap across a ditch, but stumbling,
He reached land with his foremost feet, while I slid off his back,
And wallowing in the nasty mire I had good cause for grumbling,
And do declare I'd had enough to satisfy, yours

—Bermuda Royal Gazette.

JACK.

Leaves from My Journal.

MY FIRST DEER IN THE SNOW.

IT was a score of years ago, in the northwestern part of
the State of Maine. It had been a cold winter night in the
month of March, when the snow laid on the ground to the
depth of four and a half feet in sheltered places, but less
over tracts exposed to the wind, when Nay Bennett and I
clambered out of our pit below the crust under the lee of
Emery Mountain, where we had passed a very comfortable
night, with our feet at a good log fire, and slipping on our
snow shoes, commenced our journey toward Parmachene Lake,
in search of moose.

We had not proceeded more than a couple of miles over
the crisp, sparkling crust, which was sufficiently firm to sus-
tain us, and were about entering a tract of black-growth tim-
ber, near the summit of a moderate hill, when we observed
numerous deer tracks and fresh-bitten shrubs, which indi-
cated that we were in a deer yard. It is the habit of these
animals, as well as of moose, in northern latitudes, when the
snow is deep and crusty in the month of March, to atop and
yard until the snow melts away, or becomes soft enough for
them to travel about without cutting their legs. This is
done by selecting a spot where there is an abundance of un-
dergrowth and shrubbery, which, in the warm days of that
month, throw out their swelling buds in anticipation of more
favorable weather. Upon these sweet and tender buds the
deer will browse contentedly until the snow is nearly gone.
By running over the snow as the crust begins to form in the
spring, and by depressing it, a firmer crust is formed than in
the surrounding forest, which enables them to run about
more readily in quest of food. Sometimes the area of a yard
is more than two or three hundred acres, but generally less,
depending upon the number of deer yarding together. In
this instance we found the yard to be a large one, and although
we were in search of moose, we concluded, in the absence of

venison or other fresh meat from our larder, to take in some,
if possible. We therefore prosecuted our search up and
down and across the yard until nearly two hours had passed,
and we were seemingly no nearer our game than at the com-
mencement of our search, although the signs were most en-
couraging.

As we had been traveling briskly, we concluded to take a
short halt, and let our dog Zip make the search alone for a
while. Zip was a veteran in this line of exertion, and im-
mediately put himself out vigorously at the order from Nay.
Hardly had he disappeared in advance before his quick run-
ning yelp announced the finding of our game. We speedily
followed, and found that we had halted in close proximity to
a number of deer, which Zip had started from their beds in
the snow. We saw plainly the hollows or resting places from
which they had been so suddenly startled, and down the hill-
side we saw the road or plowed furrow by which they had
escaped. It was wide and deep, and indicated the hurried
passage of a dozen or more. We could plainly hear the
yelping of Zip not far ahead, who apparently was not mak-
ing very rapid progress.

I hastily gave Nay my pack and gun, and rushed down the
hill in pursuit as rapidly as my snow shoes would allow me,
leaving Nay to follow as soon as he could with his increased
burden.

An important object after starting deer in this manner is to
hurry them up as much as possible at first, which increases
their alarm and occasions more floundering and fatigue than
would result from a slow following. Deer, when closely
pursued at first, will soon lose courage and strength if the
traveling is difficult; but if allowed to get over the first
fury, will settle down into a more cool and steady exertion.
I soon came up with Zip, who was doing all he could with
his short legs, but who found the crust too soft to fully sus-
tain him. I left him behind, which annoyed him very much,
as evinced by his redoubled exertions and yelping. A mile
more of rapid traveling brought me in sight of the deer—a
splendid drove of thirteen—led by a large buck, which I
mentally resolved should be mine.

At my near approach their exertions were increased, but
only to still more hopelessly flounder in the snow; and upon
my reaching them they separated from each other, as usual in
such cases, each taking care of himself. Singling out the big
buck, I brought him to bay, the others soon being lost to my
sight. The old fellow would turn and face me upon my near
approach; but, finding himself let alone, would exert himself
to escape until again crowded. My object was to detain him un-
til Nay or Zip should come up. Finally Zip arrived and im-
mediately commenced a furious onslaught, after the manner of dogs
of his class, which, being trained to hunt moose, do not close
in but keep up a perpetual springing and barking which serves
to annoy and hold the game at bay until the hunter arrives
with his gun. A dog of good metal and hold-fast qualities
would most likely lose his life in endeavoring to seize and hold
a full grown moose, owing to the effective manner this ani-
mal has of striking out with his fore-feet; and the dogs em-
ployed by moose hunters in these latitudes are of an ordinary
character, and are effective in their way. Zip was one of this
sort, and, although the animal we had at bay was much in-
ferior to a bull moose, I could not get him to lay hold, while
the buck was gradually working his way to a hill side not far
distant, where the snow was partially blown away, which I
feared he might reach and perhaps escape before Nay came
up with the gun.

I therefore kept very close and urged Zip on continually.
The buck would start on as speedily as possible until Zip's
running nips would bring him around, when he would charge
in a gallant manner, but Zip's ability to keep out of harm's
way was only too evident. In vain I urged him to hold, but
hold he would not, though most noisy and persistent in his
peculiar warfare. The buck finally became very furious at
this continual goading, and employed nearly all his time in
charging and striking at Zip, giving out in his fear and rage
an angry, hissing sound. In the excitement I had approached
within ten or twelve feet of him, when suddenly, disregarding
Zip, who as usual made good his escape, came upon me so
quickly that in my efforts to retreat I locked my snow-shoes
and came down upon my back.

I saw his leap, and his body coming down upon me with
his fore feet close together in striking condition. I had barely
time to twist my body a little on one side, when down in the
snow close beside my waist, came his cleaving feet. I had in
my right hand a buck-horn-handle knife with a thirteen-inch
double-edged blade running to a point. I had drawn this out
on my near approach to the buck, and as I felt his breath on
my face, I suddenly threw both arms around his neck to de-
tain him from coming down upon me again with his sharp
feet; but his strength was so great that he instantly rose in
the air with myself hanging to his neck, while Zip, now more
courageous grown, seized him firmly by the rear. The buck
was now in a decidedly bad fix, which fact he seemed
well aware of, and I was very much astonished at the rapidity
with which he leaped up and down, despite the heavy burdens
he carried in the front and rear. I came to the immediate
conclusion that his strength would outlast mine, unless abated
by some extreme action. So finally compressing my left arm,
which was hooked over his neck, and rapidly seizing his
throat with my left hand, I liberated my right arm and brought
my knife blade down to the hilt in his neck; it seemed like
butter, it slipped so readily. Down came buck, dog and my-

self in a confused sort of way, myself underneath; but the
buck had ceased to struggle, and I pushed aside his head to
keep off the hot red blood which spurted from his wound and
nostrils and rose to my feet. The buck was dead and I had
not received a scratch. Nay soon arrived, and we dressed
and hung up the buck in a tree above the reach of animals.
Cutting from him enough meat to supply our immediate
wants, we pursued our way toward Parmachene lake. When
we returned, two weeks later, we found his frozen carcass
hanging as we left him. Nay rigged up a rough sled and
hauled him out to the settlement, where we found his weight
to be one hundred and eighty-nine pounds. WHITSEY.

For Forest and Stream and Rod and Gun.
NICARAGUA.

FROM several long interviews with an acquaintance just
returned from Nicaragua, whose experience and travels
extend over a period of nearly three years there, we have
gathered the following facts:

It lies between Honduras on the north and Costa Rica on
the south, extending from latitude 10 deg. 35 min. to 15 deg.
north, and from Caribbean Sea on the east to the Pacific Ocean
on the west, with an area of 50,000 square miles. The country
is traversed by two nearly parallel ranges of mountains, run-
ning almost due northwest and southeast. These are the cor-
dilleras or main backbone of the isthmus, and the coast range or
volcanic mountains of the Pacific. The latter range extends
from Guatemala through San Salvador and Nicaragua, termi-
nating in the great mountain group or nucleus of Costa Rica.
This range does not vary from more than ten to twenty miles
from the Pacific coast. Between the two ranges of high moun-
tains is formed a great interior basin of nearly 300 miles in
length by 100 in breadth, in the centre of which is situated
the broad and beautiful lakes of Nicaragua and Managua. The
first named is about 130 miles long, and from 20 to 30 miles
wide, interspersed with a number of large islands, many of
them rising several hundred feet above the water, and perpe-
tually clothed in tropical verdure and affording range for large
herds of cattle. The whole country is considerably elevated
above sea level, if we except a small strip lying along the
Pacific, and about 20 miles inland from the Caribbean Sea,
which has a rather humid and unhealthy climate, but the re-
mainder of the Republic is entirely healthy. The Segovia
country, lying north of Lake Nicaragua, is elevated and moun-
tainous, and enjoys a delightful climate throughout the year.
Wheat has been successfully raised here, and corn grows
throughout the country. Bordering on the shores of the lakes
and Pacific, are to be found plantations of coffee, cocoa,
sugar, indigo and vanilla. Many residences are embowered
with a rich profusion of flowers, vines, shrubs and tropical
trees, and near by are to be found growing pineapples, oranges,
bananas, coconuts, limes, plantains, guava and other fruits
unknown to the more temperate climate of the United States.
There are two seasons—the rainy and dry. The rainy season
lasts from May to October; yet, during the whole of this sea-
son, rain rarely falls until late in the afternoon, continuing
through most of the night. During the dry season but little
rain falls. The thermometer throughout the year varies only
from about 68 deg. to 86 deg. F., but seldom reaching 90
deg. in the shade. A greater portion of Nicaragua is covered
by dense growth of forest, including mahogany, logwood,
lignum vitae, gutta percha, Peruvian balsam and numerous
dry woods, gums and drugs. All kinds of wild animals are to
be found, and birds and reptiles in profusion. Deer are plenty,
and are only killed for their hides.

The population of the Republic is chiefly confined to the
towns and villages, with the exception of the different Indian
tribes living in the remote districts bordering on Honduras and
the eastern shore. The smallest and better class are made up
of native Spanish and their descendants; the balance are
largely composed of Indians and mixed races. All good citi-
zens from the United States are gladly welcomed in Nicaragua,
and but little trouble is experienced in acquiring sufficient of
the Spanish language to be understood. The inhabitants are
mostly indolent, as is common with all tropical countries.
They dress in linen or other cool material, and are fond of
spending the heat of the day swinging in their hammock in
some cool shaded spot. The Indian and other laborers em-
ployed on coffee, sugar and other plantations, go naked from
the waist up, and wear broad Panama hats. The country has
been that of a cattle raising one for upwards of two hundred
years, and fine herds of stock that would do credit to many of
our Western prairies are to be seen grazing along the lake
shores and throughout all Segovia. Many thousand hides are
annually exported, while the meat is cut in slices, jerked or
dried, and sold at a good price far down the coast to South
America.

The outlet of Lakes Managua and Nicaragua are through
one river—the San Juan—whose length from the lake at Fort
San Carlos to the Caribbean Sea at Greytown, in its windings,
is one hundred and fifteen miles. It is a beautiful river, but
is obstructed by the rapids del Castillo, de los Valos, Ma-
ebuca and others of less note that are a serious impediment to
navigation, except with canoes, which the Indians pole around
by keeping close to the north shore. There are two small
steamers that ply above and below the rapids, which are con-
ducted as a monopoly from the government by a rather pompous
Frenchman residing at Greytown, who, from the privilege of

his monopoly, charges exorbitant rates of passage from the port of Greytown to the inland towns on the lake. Greytown was made a free port by the English some years ago. All import duties to Nicaragua are collected at St. San Carlos at the head of the San Juan, and go toward sustaining the general government. The duty imposed on all foreign goods entering the republic are from 45 to 55 per cent., and there is a reciprocal duty between the other States of Central America of 4 per cent. The religion is a liberal Roman Catholic—all monasteries have been abolished by a voice of the people—and there are a number of instances where the priests are married. Strangers arriving in the country worship after their own form without fear of molestation. The whole of Nicaragua is a grand study for the naturalist, and for a party of several sportsmen no finer or more pleasant place for a few months' vacation could be found in the whole of North America.

SELTHAR-BOZNAL.

ON THE LOWER RIO GRANDE.

THE MEXICAN METHOD OF HUNTING DEER.

YOUR very interesting paper keeps me informed as to the sports in other portions of the land, and I am constrained to give a short sketch of how we do it on the lower Rio Grande. The game along the river consists of deer, turkey, chicalaca, peccary and duck and goose, with quail of two kinds in the back country. The chapparal, for some ten miles back from the river, is very dense, in some places positively impenetrable, every bush heavily armed with strong, sharp thorns. Occasionally one finds an open glade, but they are not frequent. Turkey have been quite plenty, and we have had some good sport. They are much more shy here than in other parts of the State, and we do not make the large bags mentioned by "Bushwhacker"—who, by the way, does not locate Fort Clark properly. It is west, not south, of San Antonio. About the middle of January, the moon being full, Lieutenant W. and I left camp about 7 P. M., to look up some turkeys W. had seen in the afternoon of the same day. They were supposed to be roosting in a grove of large hackberry trees, and when near the spot we separated some fifty yards and entered the wood on parallel lines. In the midst of the grove is a beautiful grassy dell, devoid of underbrush and surrounded by tall trees, their branches heavily hung with gracefully drooping moss. On this moonlit night the scene presented was sufficient for the moment to make me forget my errand, but I was brought back suddenly to mundane affairs on perceiving a huge form approaching me from out the shadow of a tree. If elephants were to be found in this country I would have been positive that this was the largest of his kind. At first it seemed immense, but as it came nearer dwindled down to a large sized peccary. Raising my carbine to fire, I caught sight of another moving object on my right. Thinking it better to look to the rear in case I wished to move in that direction, lo! there was another within ten feet. Knowing that the squeals of a wounded pig would bring the whole herd upon me, I hesitated a moment before firing. There was a tree not far off on my left which could be reached easily, so selecting the nearest peccary, I fired, executing an instant after a "vault to the rear," in anticipation of a charge; but piggy was "very dead," and the rest scampered off. While cleaning and hanging him up I heard the report of W's gun, followed a moment after by the dull thud of a dead turkey as he struck the ground. The flock scattered about through the wood; one of the birds alighting on a tree near me was soon hanging alongside of the peccary. We hunted diligently, but killed no more birds that night. It is very difficult to distinguish them from the bunches of moss.

The flesh of a young peccary is very excellent if the animal is skinned soon after killing. About the first week in January we tried the Mexican method of hunting deer during the rutting season. Provided with a pair of buck's antlers, which had been sawn apart, and armed with carbines, we struck out through the brush until we came to a small glade in which were two or three large mesquite trees. Selecting one easily climbed, we mounted up, one on either side, seated ourselves comfortably as possible and facing in opposite directions. With our hunting-knives we clipped off all little twigs that might interfere with our guns. We were about twenty feet from the ground. All around the glade the chapparal was quite thick. W. then took the horns, one in each hand, and struck them together after the manner of bucks fighting. One or two hard clashings together, and then the scraping and twisting of tangled horns. After resting a minute this was repeated. The sound can be heard a long way off, and, if the imitation is perfect, any buck hearing the noise will come up on a run. If he suspects anything wrong he will steal around to leeward and come up against the wind. We had been in the tree some fifteen minutes when I caught sight of a pair of horns moving along above a bush some distance off. A word to W., who very quietly dropped the horns and took his gun. The buck came on slowly, moving around to leeward and stopping occasionally behind a bush. He seemed to see us, but did not connect us with the noise. When about forty yards away I covered him, and, as he came in full view from behind a cactus plant, let him have it.

Hanging him up we went on further, tried a number of trees, but failed to call up any deer until near evening, when a fine young buck came up with a grand rush—mad—full of fight. He was within twenty yards of us before he discovered his mistake, and then it was too late. Four hundred and five grains of lead through his heart was more than he could stand and live.

This seems murderous work, taking advantage of the chivalrous instincts of the animal—shooting him down at the moment when he is prepared to do battle against all odds in order to gain favor in the sight of some soft-eyed doe. But it is no worse than calling moose or imitating the turkey-hen and slowly coaxing the proud old cock-bird within rifle shot. Then, too, it is only during the rutting season, which down here begins about the 15th of December and ends the 15th of January, though the bucks do not shed their horns until the latter part of February. Besides, in this part of the country, the chapparal is so dense that it is almost an impossibility to shoot bucks unless some advantage is taken of them. The does do not suffer—they never come up at the call, and the number of deer is not materially decreased. As with calling the turkey, the imitation must be exact, the hunter must be still as death; the slightest movement in the tree, if detected, will send the buck off. I have never heard of the above method being tried elsewhere than along the lower Rio Grande. Would like to know from the readers of your paper whether it is new to them.

In the FOREST AND STREAM for January 31st I noticed, in "Answers to Correspondents," the question as to whether Kit Carson served during the rebellion. In justice to the memory of a brave man, I wish to say that Kit Carson was colonel of a New Mexico regiment of volunteers, and, though he took part in none of the great battles of the war, was ready and willing to do his share. "He also serves who only stands and waits."

"HIDALGO."

For Forest and Stream and Rod and Gun.

HOW A QUAIL SAVED A MAN'S LIFE.

OLD UNCLE JOHN SMITH, who was one of the most famous Indian fighters and trappers on the plains of by-gone days, was once saved by a quail. "Uncle John" was acquainted with almost every creek and canyon from the Yellowstone to the Red River, and it was while a party was camping with him one evening in 1868, on the Washita River, that he related the story in question. Some of the party had shot several quail during the day, which had been cooked by being spitted on willow twigs over a bed of hot coals; but much to the surprise of all, Uncle John declined to partake of them, though he had often said he could eat anything from dried buffalo hide to a tender antelope steak.

"Boys," said he, "I don't touch quails. I haven't touched one for nigh twenty-five years. One of the little cusses saved my life once, and I swore then I would starve before I would ever eat one, and I have kept that oath ever since, though I've seen the time when I could 'a killed 'em, when all I had to chew on was the soles of a pair of greasy moccasins."

Of course, all were anxious to know how the old trapper's life had been saved by so small a bird, and, after supper, gathered round the fire to listen to old Uncle John's story.

"Well, boys, it was a good many years ago—I think in June of 1847—I was coming in from way up the Powder River country where we'd been trapping, and war on our way to Independence with our pelts. There was with me a man by the name of Thorp, one named Boyd, two more whose names I don't remember, and a nigger wench we had for cook. Everything went on all right till we got down on the Arkansas, somewhere near Pawnee Rock. The next morning before we broke camp, Thorp and Boyd started out for the horses, which war picketed a little ways off, and while they war gone I seen some buffalo a little off to their right, and picked up my rifle to go after one. The grass war pretty tall on the bottoms, and I got in easy shooting distance and pulled up my rifle to take a shot. Just as I war running my eye along the barrel, a quail jumped up from the grass under my feet and lit right on the front sight, and, of course, I couldn't get aim. We didn't shoot reckless in those days, and every shot had to count or a man war the laughing stock of his comrades for a month if he missed his game. So I shook the little critter off and brought up my rifle again, when the durned bird lit right on the same place, and at the same time my eyes kind of got hazy, and I couldn't see anything for a minute. But when I came to the quail was gone, and right in front of where the buffer had stood, and close to Thorp and Boyd, half a dozen Indians jumped up and fired at them, killing Thorp instantly and wounding Boyd. He and I, however, got to camp, and with the other two men, kept the Indians off, who soon went away. Thorp was, of course, scalped and his body left for the wolves, as we couldn't get it, because we had to pull out as soon as the Indians left. Boyd died, and we buried him there. You see, if I had fired at the buffer the Indians would have had me before I could have loaded my rifle again, and as they knew I had not fired, they kept at a respectable distance. That quail saved my life by interfering with my sights, and that's the reason, boys, why I never eat quail."

GEORGIA.

Fish Culture.

MIGRATION OF FISHES.—No. 3.

BY G. BROWN GOODE—READ BEFORE THE AMERICAN FISH CULTURAL ASSOCIATION.

CONCLUSION FROM STRUCTURE AND KNOWN HABITS OF THE FISH CRITICISED.

Professor Hind lays much stress upon the presence of a "film" over the eyes of the spring and the autumn mackerel and upon their alleged capture in winter in the waters of the Dominion, and also quotes arguments for hybernation, based upon the resemblance of the mackerel to the batrachians (which are known to be capable of hybernation) in color, and upon its resemblance to embryonic forms of other fishes, which is supposed to "prove him low in the scale of intelligence" (Part I., p. 79). To the latter it is needless to refer. The so-called "film" on the eye is not peculiar to the mackerel. Many fishes, such as the shad, the alewife, the menhaden, the bluefish, the mullet, the lake whitefishes, and various cyprinoid fishes, have a thick, tough membrane covering the anterior and posterior angles of the orbits, narrowing the opening to the form of an ellipse, with a vertical major axis. This possibly becomes somewhat more opaque in seasons of decreased activity. It has never been observed to cover the whole eye. Until the fact has been established that "a skin forms over the eye" in winter, it is quite unnecessary to propose the theory that such a skin "is probably designed to protect that organ from the attacks of the numerous parasitical crustaceans and leeches which infest the external portions of the bodies of fishes, and are also found internally, as in the gills of codfish" (Hind, op. cit., Part II., p. 11.)

A number of instances are cited to prove that the mackerel schools remain on the Dominion coast throughout the winter season. If this can be well established it is a very strong argument in favor of hybernation. Let us analyze this testimony.

Dr. Gilpin is quoted to the effect that, during some seasons, they linger on the Nova Scotian coast until December, and allusion is made to a mackerel obtained by him at Halifax, Oct. 27, 1875 (Part I., p. 79.) Mr. John Rue remembers that his father used often to speak of mackerel "coming on shore like squid, with scales on their eyes and blind, about Christmas," about forty years ago (Part I., p. 78.) Mr. Jabez Tilley states that they have been taken in November in Trinity Bay. Prof. Hind also states that they are to be found on the whole coast from Quirpon to Cape Spear during November and December. He gives no authority for this statement, and it is to be inferred that it is founded upon personal observation. Then there is the vague statement of Mr. Ambrose, already quoted, that mackerel have been speared on muddy bottoms under the ice.

Now, this testimony does not, by any means, tend to prove that the mackerel remain near the coast in winter. In the first place, there is no satisfactory proof of their occurrence later than Oct. 25, since that is the only evidence fortified by a memorandum of date, and the memoranda of fishermen are not more certain than those of other men. In the second place, it is not impossible that mackerel linger in these waters until November, or even December, in the case of a warm autumn. The temperature necessary for the menhaden cannot be many degrees below 50 deg., while the mackerel appears to endure a temperature of 40 deg. or less. Menhaden linger in Maine waters till November, and in Massachusetts Bay and the Vineyard Sound till December.

Finally, the undoubted capture of many individuals in winter on the coast of Newfoundland, would, by no means, prove that the great school were there throughout the season. Disabled, blind or diseased individuals would naturally be unable to accompany the departing school. Such fish would naturally grovel on the bottom in a helpless state, and might easily become impaled on the eel-spears, or might occasionally be accidentally detained. Mr. Peter Sinclair, a well-known fisherman of Gloucester, stated to Prof. Baird that, some years ago, a school of mackerel were detained all winter in a small river in Nova Scotia and were speared out of the mud. This is, doubtless, hearsay testimony, and is given for what it is worth. I do not doubt that there have been individual cases of this kind, but I maintain that no generalization should be founded upon them.

The preceding paragraph is devoted to the refutation of the idea that sea-fish hybernate. This is regarded as the least probable of the three hypotheses stated in paragraph 83. In paragraph 84 it is stated that the sea-herring and many other fishes have two kinds of migrations, one bathic or from and toward the surface, the other littoral or coastwise. Now in some species the former is most extended, in others the latter. The anadromous species very probably strike directly out to sea without coasting to any degree, while others, of which the mackerel is a fair type, undoubtedly make extensive coastwise migrations, though their bathic migrations may without any inconsistency be quite as good as those of the species which range less. Upon this point I cannot do better than to quote from a manuscript letter written by Professor Baird to the Hon. Hamilton Fish, Secretary of State, dated July 21, 1873. Having expressed the views concerning the migration of the herring and shad already quoted in paragraph 84, he continues:

"The fish of the mackerel family form an exception to this rule. While the herring and shad generally swim low in the water, their presence being seldom indicated at the surface, the mackerel swim near the surface, sometimes far out to sea, and their movements can be readily followed. The North American species consists of fish which as certainly, for the most part at least, have a migration along our coast northward in spring and south in autumn, so that of the ordinary pleasure seeker, and their habit of schooling on the surface of the water enables us to determine this fact with great precision. * * * Whatever may be the theories of others on this subject the American mackerel fisherman knows perfectly well that in the spring he will find the school of mackerel off Cape Henry, and that he can follow them northward day by day as they move in countless myriads on to the coast of Maine and Nova Scotia."

It is difficult to estimate to what extent the advocates of the hybernation theory have been influenced by patriotic motives in their efforts to prove that the mackerel remain in the waters of the Dominion of Canada throughout the entire year. It is certain that all recent treatises on ichthyology by Canadian writers have appeared in the form of campaign documents, apparently intended to influence the decisions of Diplomatic Commissions.

I am by no means prepared to maintain that mackerel do not pass the winter in the American domain of her Imperial Majesty. It seems important, however, that the subject of the migration of fishes should be restored to its proper position as a question of abstract scientific importance. Let us glance at the argument of Mr. Whiteher and Professor Hind against what the former is pleased to style the "American Theory."

In the report of the Minister of the Marine and Fisheries for the year ending the 30th of June, 1871, Mr. W. F. Whiteher, Commissioner of Fisheries, published a paper entitled "American Theory Regarding the Migration of the Mackerel Refuted" (pp. 186-189).

Mr. Whiteher opens his letter by claiming that the theory of north and south migration was invented solely in support of a claim advanced by citizens of the United States to participate in the Canadian inshore fisheries. "This ingenious but traditional theory of annual migration having gained local credence amongst some of the Nova Scotia fishermen engaged in United States fishing vessels, has been sagaciously indorsed and circulated by American Authors." He also refers to evidence "supposed to have been procured among the fishing population of the New England States."

I need only say that these claims are unjust, and that the theory of the annual north and south migration of the mackerel is time honored, and was held conscientiously by ichthyologists of the United States and the Provinces long before the question of fishery treaties assumed its present aspect. It is manifestly unfair to state that while the theories which prevailed respecting the habits of herring and mackerel were formerly similar, that, "in the former case it is probable that traditional and imperfect information formed the basis of error, while in the latter instance it is most probably founded on misinformation dictated by sectional interests." Mr. Whiteher's own paper upon migration is the only one of American origin in which I have seen scientific method sacrificed to partisan spirit.

Having read Mr. Whiteher's introduction, one might readily predict what sort of an argument he will wrench out of the statements of "such disinterested authorities as may be readily quoted." First he gives extracts from Mitchell and the Edinburgh Encyclopedia regarding the habits of the herring. Granting all that is claimed about the herring,

without reference to the reliability of these authorities, what do we find? Merely a *petitio principii*! The habits of the herring and the mackerel are not known to be the same. In many particulars they are diametrically different, for the former loves cold water, the latter warm water.

Various provincial writers are now quoted: Mr. Perley, who says that "naturalists now tell us," and "it is now considered settled," that the mackerel is not migratory, but draws off into deep water at the approach of winter; and Mr. Knight and Mr. Forbin—though the reason for these quotations is not apparent, since no reference to the winter habits of the fish can be found therein. He does not refer to the writings of Mr. Ambrose and Mr. Johnston, Canadian writers, who advocate the migration theory. Yarrell and Couch are next quoted, but neither of them ventures to give a decided opinion. Finally, we have a paragraph compiled from five French Encyclopædias, good and bad, no means being afforded of distinguishing the opinions of Cuvier from those of Cuvier's literary staff. Mr. Whitehead's conclusion is this: That "it is clearly neither necessary nor accurate that mackerel should perform the migrations ascribed to them by American writers." The migrations of the mackerel are neither proved nor disproved by special pleadings of this description.

The spirit of Prof. Hind's publication is very different. He writes from the standpoint of an investigator, and his book is an important contribution to our knowledge of the habits of fishes in relation to temperature and currents. I feel obliged, however, to call attention to a very serious flaw in his chief argument against the annual migration of the mackerel. In the chapter on the "Relation of the Supposed Migratory Movements of Mackerel to Isothermal Lines" (Hind, op. cit., Part II., pp. 15-17), it is claimed that a migration to the north in the spring "presupposes the movements of bodies of the same great schools of mackerel" which are alleged to pass Massachusetts Bay from the waters of the coast of Virginia and New Jersey, not only through from ten to twelve degrees of latitude, but it assumes that they are able to cross in the early summer, and frequently before spawning, numerous isothermal lines in descending order. He then refers to the article upon the Gulf Stream in "Petermann's Mittheilungen" for 1870, in which the marine isothermals for the different months are shown by means of a chart. A table is given showing the isothermals for July. That of 68 degs. would touch the coast at Delaware Bay; that of 63 degs. 5 mins. at Long Island; that of 59 degs. at Boston; that of 54 degs. 5 mins. at Cape Sable, N. S.; that of 50 degs. at Cape Race, and that of 45 degs. 5 mins. at the Straits of Belle Isle.

From this he concludes that "a school of fish moving rapidly from Delaware Bay to the Straits of Belle Isle, would pass in July from a mean temperature of 68 degs. to a mean temperature of 45 degs., a difference of more than 22 degs. Fahrenheit."

This theory would be very satisfactory if it could be admitted that the isothermals for July indicate the actual temperature of the sea from day to day. In reality the marine isothermals are constantly varying, and in this respect are different from those printed upon a chart, as no one knows better than Professor Hind. A glance at the tables in appendix F, and the conclusions deduced from them in regard to the menhaden (paragraph 85) will show that schools of fish do not find it necessary to force their way through walls of sea temperatures, but that their movements from south to north are exactly correlated with the seasonal rise of temperatures. As soon as the water at a given point reaches a certain temperature, which for the mackerel on our own coast appears to be as much as 45 degs., the fish make their appearance, and with the advance of the season they appear further and further to the north. Mackerel do not appear on the coast of Maine until the water there is as warm as it was off Cape Hatteras at the time of their first arrival. This is the case whether we suppose their general movement to be parallel with or vertical to the coast line.

I have entered the discussion of this question, not with any idea of attempting to prove that mackerel migrate south from the Gulf of St. Lawrence, but to show that a comparatively rapid northward movement in May and June does not necessitate a "sudden plunging from high to low zones of temperature."

(Concluded in our next.)

BROOK TROUT IN NEBRASKA.

NORTH PLATTE, Nebraska, April 5, 1878.

EDITOR FOREST AND STREAM:

Mr. Editor: At our last regular monthly meeting of Our Sportsmen's Club we proposed to stock the streams and small lakes near here with trout. As no trout has ever been seen here, I should like first to ask: First, do you think they will grow here? If so, of whom can we procure trout spawn, and at what price? Should like to purchase them as near home as possible. We would like you to publish this letter, as it may attract the attention of some one who will answer us by return. You will confer a favor upon us if you will answer by letter. Respectfully,
W. W. CONKLIN,
Sec., North Platte Sportsmen's Club.

[We cannot tell whether trout would thrive in Lincoln County; but probably they would if you can change those natural conditions which have hitherto prevented trout from thriving in the rivers after they leave the mountains. Overflows, shifting sands, deposits, change of temperature, and especially the three former, totally prevent the reproduction of trout from the ova (after the rivers enter the plains), while the *Cyprinidae* inhabiting the river will prey upon the fry. You can, however, set aside and confine the water so as to raise trout artificially, but this will not stock the rivers. If your tributaries are not subject to the same contingencies, to an appreciable degree as the main river is, you may succeed then. The experiment is worth trying. The nearest place would be in Iowa. Apply to the Fish Commissioners, say, to B. F. Shaw, of Anamosa.—ED. FOREST AND STREAM.]

GRUBS AND WORMS IN FISH.—Almost every living creature has its peculiar parasite, and the fish family are not exempt. Indeed, almost every variety of fish is liable to be infested with some kind of external parasite at certain seasons of the year, though it does not follow that such parasite damages the health of the fish or its edible qualities. There are also internal parasites in fish, which seriously affect their bodily health and comfort, and doubtless impair their fitness for

food. The *tenia*, or tape worms, are not uncommon, especially in the *salmonidae*. Only last week a gentleman of this city, known as a naturalist, discovered five tape worms of several inches in length in the stomach of some pond-raised fish, which came from Pennsylvania. He reported the fact to us. What we have said is corroborated by that careful observer, Seth Green, Esq., as well as all students of science. Quite recently a Mr. St. John, of Port Jervis, mentioned having found small grubs, or worms, in the black bass caught in the Delaware last season, and applying to Mr. Green for information, elicited the following reply:

C. ST. JOHN, JR.

Dear Sir: It is not a very uncommon thing to have small worms or grubs in fish. I have often seen them. They do not do any harm if you do not see them. They are like skippers in cheese. It is all cheese, if you do not see the skippers. Because they are affected last year it is no sign they will be this year. Yours
SETH GREEN.

One of the most noteworthy examples of wormy fish was reported in our paper last week (and previously) referring to the wormy trout of the Yellowstone. These worms are in the flesh, just as the *trichino spiralis* infest pork. We do not know that their presence has been scientifically accounted for by Professor Leidy, or any one else.

CRAWFISH CULTURE.—The following note from a recent number of *Nature* is not only very interesting, but also supplies some information for which we have long been waiting. Will our California correspondent who asked for information on this subject please take notice:

"The Piscicultural Institution of Schwerin has recently made some important experiments, with a view to ascertain whether the artificial culture of the river crawfish (*Astacus fluvialis*) is possible on a large scale. The experiments are entirely successful. In the spring of last year some seven hundred crawfish, with ova, were placed in two circular ponds, of only six feet in diameter, and for each animal a separate hole had been constructed. At the end of November the ponds were drained in order to separate the young crawfish from the old ones. It appeared that of the latter only three or four were crawling about at the bottom of the pond, while all the others had occupied their respective dwellings. The young were of the size of a bee, and extremely lively; they were taken out of the ponds, and already on the following day could be fed artificially with carrots and meat. Many a land or garden proprietor could thus make crawfish-culture a lucrative pastime at very little cost, particularly since the consumption of these crustaceans increases largely every year."

FROM MR. WILMOT.—G. S. Page, Esq., Vice-President of the American Piscicultural Association, has communicated to us the following from a letter just received by him from Sam'l Wilmot, Esq., of Newcastle, Ont.:

"I have been most successful this year in my Dominton operations, having already turned out upward of twenty-five millions of whitefish fry, mostly in the Detroit River. So, you see, your people will get equal benefit from this great crop, as I am doubtful whether I have infused into them Canadian sentiments sufficiently strong to induce them all to come back on the Canadian side of the lake again. We shall turn out very shortly some seven millions of salmon and salmon trout fry."

ANOTHER SALMON IN THE DELAWARE.—We are indebted to Major E. J. Anderson, Commissioner of Fisheries of the State of New Jersey, for the interesting communication that a fine salmon was caught last week in the Delaware River, some two miles above Trenton. Major Anderson writes:

"This settles the question as to whether salmon will live in our waters. The fish was three feet six inches in length, and weighed twenty-three and a quarter pounds. This salmon undoubtedly owes its origin to young fish placed in the Delaware some four or five years ago." It would materially assist the Commissioners, Messrs. E. J. Anderson, of Trenton, N. J., and Theodore Morford, of Sussex Co., in case other salmon were caught in the Delaware or its tributaries, if these gentlemen should immediately be apprised of the fact. This salmon was caught in a shad net by Mr. Jacob Booz, of Trenton.

FISH FOR THE SUSQUEHANNA.—A. T. Clapp, Esq., of Sunbury, informs us that 3,000 salmon trout, and the same number of brook trout, were deposited in the streams adjacent to Sunbury. A plant of 8,000 California salmon has also been made recently in the upper waters of the west branch of the Susquehanna, above Renovo, and 2,000 in Paddy's Run, a tributary near that place.

SHAD PROPAGATION IN VIRGINIA.—The United States Fish Commission commenced the work of shad propagation in the Albemarle Sound last week, having distributed nearly a million young shad in the rivers and streams of Virginia, North Carolina and Alabama. For a month to come the work will continue on equally as large a scale. The apparatus for shad hatching is more extensive than the Commission ever used before.

THE SUSQUEHANNA FISHERIES.—The committee appointed by the Legislature to report on the Columbia dam have reported that the only possible way to restore the fish to the Susquehanna is to remove this dam.

—Theo. Morford, Esq., cashier of Sussex National Bank, Newton, New Jersey, has just been appointed Fish Commissioner of the State. His coadjutors are E. J. Anderson and B. F. Howell, the latter reappointed.

LAND-LOCKED SALMON IN CALIFORNIA.—San Francisco, Cal., March 28, 1878.—I learned to-day through Maj. E. W. Leonard that they have land-locked salmon in Clear Lake, Lake Co., Cal., which weigh from one and a half pounds to

seven pounds, and that they are an exact counterpart of the land-locked salmon in Maine. They take them with a spoon bait, therefore they will not have to look for land-locked salmon spawn for this State from the East any more. The State Commissioners have just put in the lake a large number of land-locked salmon fry. They are taking whitefish from their spawning beds in Lake Tahoe that were put in two years ago. They are also taking shad from five to eight inches long here in the Bay of San Francisco, supposed to be one year old—they take them while seining for herring. This should not be done.
B. B. P.

THE PRUSSIAN FISHERY LAW.—Although the Prussian fishery law has been in force for four years and a half, its clear and distinct regulations are nevertheless transgressed in many places, not only because the privileged fishermen and local authorities themselves are the transgressors, but chiefly because people seem loth to abandon the old accustomed way of fishing, leading to the final extermination of fish. It is especially paragraph 50 of the law, which imposes a fine of \$35.70 for fishing during the season of protection (Schonzeit), which has been transgressed, and great damage has undoubtedly been inflicted on the fisheries by the neglect of firmly upholding the letter of the law in this matter. No less damage has been inflicted by the frivolous destruction of young fish. In view of these evils the committee of the German Fishery Association has undertaken to do all in their power to further a strict observance of the fishery law, and at its last session, of the 4th inst., it was resolved to promise a reward to all those persons who would show special zeal in detecting such transgressions, and thus enable the authorities to punish the transgressors. The report should be made to the Fishery Association and examined by them, and, if necessary, the reward might be certified by the local authorities. All information regarding transgressions of the fishery law should be addressed to the German Fishery Association, Berlin, W. Leipziger, Platz 10, and all the necessary steps will be taken for punishing the transgressors.

Natural History.

DEER SHEDDING THEIR HORNS.

NEWPORT, Ky., March 18, 1878.

EDITOR FOREST AND STREAM:

In reference to the shedding of deer horns, and the statement of Mr. W. H. Cassell, Superintendent Park Police, Baltimore, I beg leave to venture the following remarks, based on experience which was gathered in Europe (Germany), where I, from earliest youth, had ample opportunity to study the habits of deer there existing—*Cervus rufus*, *C. dama* and *C. capriola*. As to the manner of shedding their horns I fully coincide with the opinion of the contributor signed "Pennsylvania," expressed in the last number of FOREST AND STREAM, and wish to add that I myself have shot, and have seen others shoot, deer with their old horns at a season when other deer commenced again to rub off the velvet of the fresh horns. Disease, or partial loss of the genital organs was, in every instance, found as the cause of this irregularity. I have no reason whatever to doubt the correctness of Mr. Cassell's observations regarding the hurrying of the shed horns, having witnessed the same operation in small enclosed parks, and, compared with the habits of deer in the unbounded forest, or in large parks, extending over an area of 5,000 to over 15,000 acres, as exist in Europe, and where in the deer cannot feel the imprisonment, this action appears as a display of *craze* or ill-temper, which the deer in confinement will show toward anything strange or in his way. So will the deer only in small parks—buck as well as doe—abrade the bark from trees with their teeth, not for the purpose of eating it, but to dispel *craze*, often causing great damage to the woods. Frequently I have observed deer in parks playing with their shed horns, pounding them with their feet, even turning up the ground, but I never witnessed the actual burying of the horns. This would have been often a matter of but small exertion in soft ground and under decayed leaves.

More circumstances, based on observations, prompt me to contradict the assertion that deer bury their horns, viz.: In the deer parks of Europe, within a short time after the shedding of the horns, they are sought for, mostly with good success. A small gratuity is paid to the finder for each pound of horn delivered. Hundreds of pounds are thus collected, and the cash realized by their sale forms an item in the keeper's accounts. I myself have searched, morning after morning, on grounds where the herds nightly used to feed. I have searched the path of animals with uncommonly large or irregularly formed horns (especially *Cervus capriola*), and I found those freshly shed horns lying openly on the top of the ground, sometimes nearly together and sometimes a mile or more distant from each other. I have seen deer drop their horns—in most cases only one at the time—either in consequence of a jump or a violent motion of the head, sometimes coming accidentally in contact with some obstacle, as a branch of a tree, but I never observed that the animal was looking after the horn, or tried to conceal it. Such is my observation in the open forest and in large parks. The reason why not all shed horns can be found, may be easily accounted for. The separation of the horns from the head in consequence of absorption causes pain and irritation. The animal, therefore, seeks during the day, in that season, the retirement of the most isolated places—when in mountainous regions, the summits; when in a populated country, the thickets, and when in the quiet forest, the high woods. In the first two places named the hunter will seldom intrude nor have a good chance to find the lost burden, while in the last mentioned place the horn will soon disappear in the soft ground, under moss, decayed grass or leaves. The observing forester can tell you how soon a broken down branch of a tree will become invisible.

Finally, I can state the correctness of the remark, that the spike buck will, in every instance, get out of the way of a buck with larger horns.
PETER SUELL.

[We regard the above as a most interesting addition to the literature of this subject, and admire especially its mild and fair tone.—En.]

THE BOSTON BUCK.—Editor *Forest and Stream*: Since my note in reference to the buck on Boston Common, I have watched his lordship, and perhaps your readers might wish to learn that he dropped his horns on the 23d and 24th of March.

* Das Fischereigesetz für den Preussischen Staat, from a Berlin daily paper; translated by H. Jacobson.

The buck is six or seven years old, weighs about one hundred and fifty pounds, and is a very good specimen, although in confinement he seems to lose none of the characteristics of his race, having killed last fall no less than six of his companions during September and October. When once his relations were established with one of the flock, his jealousy and rage were unbounded at the approach of any other, whether buck or doe. Being confined in such close quarters, they were unable to protect themselves by flight, and if they once lost their footing they seldom got up under his fierce onslaught. In this condition, one doe, two years old, was literally disemboweled by him.

Bromfield House, Boston, April 3, 1878.

DANVILLE, Quebec, March 22, 1878.

EDITOR FOREST AND STREAM AND ROD AND GUN:

My three year old cow caribou has just dropped her horns. Her six months old buck calf still carries his two little pegs. It seems they do not shed their horns as early as deer. Yours truly. M. W. OLARK.

PROF. JORDAN ON CHARACTERISTICS OF TROUT.

BUTLER UNIVERSITY, Irvington, Ind., April 5, 1878.

EDITOR FOREST AND STREAM:

I thank you heartily for the suggestion to your Western correspondents to send on specimens of the Idaho redfish to Prof. Gill and myself for identification, and to enlarge on the suggestion. I hope that whoever catches, not only a red trout, but any singular trout, or any common trout in a singular place, or any "sparring" in Canada or speckled trout in Texas, or, in general, any fish anywhere, will think it as important to send a specimen to the Smithsonian as to send an account of it to the FOREST AND STREAM, and will attend, with equal faithfulness, to both duties. I have some time suspected that the Idaho and Oregon redfish were *Salmo kennedyi* (Suckley), *Hypisifario kennedyi* (Gill), but I do not know. May not the Texas speckled trout be *Salmo pleuriticus* (Cope)? That species ranges from the headwaters of the Arkansas and Snake rivers to the San Joaquin. By the way, the silver trout of Dublin Pond or Monadnock Lake, New Hampshire, somewhat noted among anglers, seems to be a silver-gray variety of the common *fontinalis*, not visibly different except in color. The statement in the report of the U. S. Fish Commissioner for 1872-73 (p. 373), that it belongs to the group of lake trout, probably closely related to what Dr. Prescott called *Salmo symmetrica*, is erroneous. The so-called species of lake trout, *namaycush*, *amethystus*, *pallidus*, *confinis*, *adarrondacus*, *symmetricus* and *toma* are, beyond any reasonable doubt, forms or varieties of *Salmo namaycush*, differing in some trifling respects in the different waters.

Very truly yours,

D. S. JORDAN.

[We have a full length portrait of the Rio Grande trout, to which scientists have assigned the name of *Salmo splivus* (Cope); but it may prove to be a well-marked variety of *S. pleuriticus*, both being found in the same streams. It has a blood-red band on each side of the chin.—ED.]

BLACK BEAR HABITS.—The following interesting record of personal observation adds more testimony to the curious fact noted by a correspondent, Corp. Lot Warfield, in our issue of Feb. 7:

"These hot days remind old hunters that the bears are about awakening out of their long winter sleep. They go into den at different times in different years, according to the abundance or scarcity of berries. In years of plenty, they prowl about until the last of December, and even the first of January; at other times they have been known to den up in November. Sometimes they make their quarters in a nice, snug room in a ledge; at others, in hollow logs, in hollow standing trees, under the bottoms of trees partly turned up by the roots, and even under large brush heaps, after the snow gets deep. They often come out in mid-winter, in a heavy thaw, and take a round turn of a mile or more and return to their old quarters again, thus showing that it is the warm weather which brings them out, and not because they have got their nap out. I have often seen where the bear has camped on the snow crust by breaking bows of evergreen or tearing dry-rotten logs to pieces for a nice, warm bed. They sometimes leave their winter quarters early in March, and make some other place a temporary abode until spring opens. I have known them to lay themselves away for six months at a time in a cave in a ledge in the deep recesses of the forest, in utter solitude, where the dampness of the rocks only added to the dismal surroundings. They are supposed by many to suck their claws during their long isolation, but they do not; neither do they require any nourishment, for the exhaustion of the system is so little, that they usually come out in the spring in as good condition as they enter their dens in the fall—generally fat.

"Before going into den, they eat but very little for some time, and so prepare themselves by degrees for their long fasting; and, when they come out in the spring, they are very dainty for a long time. They first eat spears of green grass, then frogs and fish as soon as the little brooklets open.

After the snow is gone and fish work up the little streams in the woods and herbage begins to spring up, the bears begin to follow the shore of ponds and streams in search of food and other bears. At this season they rub their feet deep into the ground and make deep steppings, and all other bears that happen along in these paths will step in the same foot-marks. So hunters set their traps in one of these deep tracks and cover it so that they all look alike, and they are sure of the first bear that comes along. At this time, which is about the first of June in Northern Maine, the bears will stretch up against a fir tree and bite large strips of bark and wood from the tree. Some people suppose this is to obtain balsam to heal their toes which they have sucked all winter, and so made tender. I suppose it is done because they feel savage and want to try their teeth. Others suppose it is done to let other bears know that they have been there. The next move they make, after a week or two of this tramping, is to traverse second-growth land, or where a few years before extensive forest fires have destroyed the original trees, and much down timber is the result. Here they finish up the summer tearing rotten logs to pieces for the ants and grubs they can find, until berries begin to ripen.

"The female bears naturally drop their young in the month of March, but they never leave their den before they drop them. If they are disturbed in mid-winter they will then drop them

before coming out. They seem to have the power to disencumber themselves of their young on the first scare. They naturally carry their young seven or eight months, and while the cubs are small the mother is very dangerous to intruders. She will defend her young with her life. They have from one to three at a birth, and sometimes four, but not often; the more common number is two.

"The cry of the bear varies according to the circumstances which occasion it. If in a trap, the adult will make a grunt, squeal or coarse noise, very loud and long; if calling their cubs from some distant point where they have left them, the sound is like the voice of a woman calling loudly, and if they are merely giving notice to each other while feeding or in company and not far apart, they whistle quite sharp and loud, and if suddenly startled by man or beast, they usually make a loud snort, which is like three or four coarse whistles together.

Bethel, Me., March 12.

J. G. RICHL.

SCIENTIFIC EXPEDITION AND SUMMER TRAMP.—The Butler University expedition, which was so successful last year, as may be read in *Harper's* for March, will make another trip this summer, leaving Indianapolis June 20, going by rail to Livingston, Ky., then on foot via Rock Castle River, Wild Cat Mountain, Cumberland Gap and Clinch Gap to Morristown, Tenn., exploring the caves and seining the rivers; thence up the Big Pigeon River, over the Great Smoky and Great Balsam Mountains, summits higher than the White Mountains and far more beautiful and wild: thence over the mountains of Chilowee and Nantahala (see Christian Reed's "Land of the Sky"), up the Little Tennessee River to Estatoah Falls, through Rabun Gap to Tollulah Falls, the wildest and most beautiful series of cascades east of the Rocky Mountains. At Toccoa Falls, Georgia (about July 17), the party will divide, a portion "marching through Georgia" to collect fishes, the others remaining in the mountains, returning as they please. The directors are Professor D. S. Jordan and Messrs. A. W. Brayton, and C. H. Gilbert, of Irvington, Ind.

THE ENGLISH SPARROW.—Prof. Baird has kindly called our attention to a published letter from Mr. John Akhurst, of Brooklyn, which is the strongest bit of evidence lately brought forward in support of this bird's usefulness. It is suggested that precisely the same diversity of opinion, in regard to the value of the sparrow's services, has existed in Europe, but at present, on the whole, the sentiment is in his favor. Mr. Akhurst is well known to all ornithologists and entomologists of New York as a careful and painstaking observer. He dislikes the sparrows because they destroy insects and he cannot procure specimens of the larvae of *Lepidoptera* to rear for his cabinet. At present we think the case hardly proven against the sparrows, although the weight of evidence is certainly against them. Mr. Akhurst, as will be seen by his letter, an extract from which we print below, evidently dissents from the verdict of the Nuttall Ornithological Club. He says:

"In regard to the sparrows destroying insects and larvae, I am surprised that any one claiming to be a student of ornithology should deny that the English house sparrow feeds on insects and caterpillars. Especially in the breeding season insects are its principal food, and when it has young almost any caterpillar is greedily sought after, except those thickly covered with hair. Spiders they are very fond of, and during the last few warm days every nook and corner has been explored in search of them around my two-story workshop.

"In a large Ailanthus tree in my yard I have a number of boxes, each having a tenant; I therefore have a large number constantly under my observation; many species of *Lepidoptera*, formerly plenty in Brooklyn, have very nearly disappeared, among these the ones which feed on the Ailanthus, and which nearly destroyed the foliage of that fine shade tree, have been nearly exterminated by the sparrows.

"I believe the sparrow to be a very useful little bird, and I should be very sorry to see him destroyed. I am now speaking only of the city. If it should become very abundant in the country it may do some damage to the grain crops. But that is the only harm it will do.

"In regard to its driving away native birds from the city, we never had any remain in it except a few chipping sparrows, martins and swallows, and these are all as plenty now as ever. A chippy built its nest last summer in my tree within two feet of a sparrow house. JOHN AKHURST."

Another friend of this much-talked of bird, writing from Houston, Texas, over the signature "Noranside," asks us:

"Will some of your naturalists please explain why the English sparrows do not drive away small British birds as they do American ones (or are said to)? I must confess to being a little skeptical. I was raised where there were hundreds of sparrows, and certainly there were more small birds of other sorts than I have seen close to dwellings anywhere in America. They are destructive to small grain, also to suburban birds. Fruit buds they did not trouble; at least, if so, I never found it out, and I made my living by fruit. Bullfinches were very destructive to fruit buds, and the thrush family to fruits."

FELINE INSTINCT.—A correspondent who writes from Northern New York sends us the following interesting note:

A few days ago some corn meal mixed with arsenic was set in my yard to exterminate the many rodents which were infesting it. The plate of poison was soon surrounded with rats, each one eager to obtain its full share. At length one much larger and apparently much older than the rest made his appearance, walked cautiously around the festive group, sniffed the air, then advanced closely, tasted the morsel, and by a significant wave of the nose caused the other members of the party to withdraw to a respectful distance until his appetite was satisfied.

The next day a neighboring cat took her accustomed position on the dividing fence, where she had been frequently seen to pounce upon the unwary vermin and carry them across the fence to her family. She was not stationed long before her tail began to twirl nervously from side to side, and every muscle in her system seemed to be in motion. She

glided softly down the side of the fence and across the yard until she confronted a rat; with their heads not more than eight inches apart both cat and rat stood motionless and coolly surveyed each for a minute or two when the rat started for its hole unpursued. The rat showed signs of sickness by its ruffled coat, and there is no doubt but that the feline's instinct was sufficient to warn her of the danger of taking the poisoned rat.

DOMESTICATED WOOD DUCKS.—A correspondent, "Tonic," of Berlin Heights, Ohio, takes exception to a statement made by "B." of Shakopee, Minnesota, to the effect that wild ducks will not live long in confinement, and then adduces as evidence to the contrary two wood ducks, which he says he has kept in confinement for two years. Without entering into the merits of the question here, we will say that wood ducks are very unlike most wild ducks, their habits being entirely different, and their habitat local. Strictly they do not migrate in our latitude. What our correspondent states with regard to his own experience in raising wood ducks is very interesting. We know of parties who raise wood ducks for sale. He writes:

This pair came into my possession when quite small, and were raised in a broad pen about 20 feet square. W. H. Todd, the noted breeder of land and water fowl of this vicinity, amputated the right wing of each at first joint when about two-thirds grown. I have them in a park about 50 feet in diameter with a pond in the center supplied by a spring, and though migratory in habit they stand the severest weather without shelter. Last year one pair nested in a hollow log which was provided for them and let to project a couple of feet over the water, and hatched four young, which, however, soon died, I think from eating or being stung by bees. When but two days old they would leave the park and wander in search of insects in the field adjoining. I consider the wood duck one of the most beautiful of birds, and I shall be proud indeed if I succeed in raising them. Have any of the readers of FOREST AND STREAM had any experience with them?

TONTIO.

THE FUR SEALS OF THE ISLANDS OF JUAN FERNANDEZ.—Prof. Baird has kindly brought to our notice a long published account of the seals of Juan Fernandez, which is very interesting and certainly seems worth calling attention to again. The splendid animals of this family, once abundant almost everywhere on the west coast of America, have been so persecuted by man that at present they are nowhere found in considerable numbers, except in Alaska, where they are carefully preserved. They belong to the *Otariidae*, or eared seals, which differ widely from the common hair seal of the Atlantic, and include, besides the fur seals, the sea lion, sea elephant, etc. The note is as follows:

"Mr. Selkirk says that, in November, the seals come ashore to whelp and engender, when the shore is so full of them that it is impossible to pass through them, and they are so surly that they will not move out of the way, but, like an angry dog, run at a man, though he have a good stick to beat them. So that at this and their whelping seasons it is dangerous to come near them; but at other times they will make way for a man, and if they did not it would be impossible to get from the water's side. They lined the shore very thick for above half a mile of ground all round the bay. When we came in they kept a continual noise day and night, some bleating like lambs, some howling like dogs or wolves, others making hideous noises of various sorts, so that we heard them ahoard, though a mile from the shore. Their fur is the finest that ever I saw of the kind, and exceeds that of our otters." An account of the sea lion follows. All that is said of birds is this: "We found no land bird on the island but a sort of blackbird, with a red breast, not unlike our English blackbird, and the hummingbird, of various colors, and no bigger than a large humble-bee."—*Harleian Miscellany*, Vol. II., p. 44, 45, 8vo edition, London, 1810."

It is most interesting to compare this account with those of recent writers on the same subject and to note their close agreement. See especially Captain Seamon's *Marine Mammalia* and Mr. H. W. Elliott's *Monograph of the Pribylov Islands*.

INABILITY OF AMERICAN QUAIL TO FLY ACROSS WIDE RIVERS.—A correspondent of the *Scientific American*, writing from a town in Louisiana, situate on the Mississippi, where the river is about 1,200 yards wide and about fifty feet above tidal water-mark, says that he has seen whole coveys of quail (or partridges as they are termed in some of the States) go down into the water at 600 yards, though while shooting he remarks that he has seen single birds go nearly as far to windward, until they rose to the height of forty feet, and then follow the wind to cover. In one instance he observed a covey starting from immediately below Natchez, Miss. (an altitude of 260 feet) to fly across the river, at that point 1,000 yards wide. They came "like a shot," almost describing a "bee line" from the altitude to the bed. They were unable to perch, and what were not killed by striking the houses were picked up exhausted. This was in month of October, and the birds were of the May hatch. The writer adds that he has seen coveys fly from drift pile to drift pile, and accomplish their migrations in that manner.

[We are very much disposed to doubt the accuracy of the above statement, but if it is true that a quail cannot fly 1,000 yards from an elevation of a tenth of the distance, the fact is certainly worth knowing. Have any of our correspondents anything to offer on this point?]

WE MOURN HIS LOSS.—Obayseh, the hippopotamus at the London Zoo, is dead. This fine beast made his first plunge into the White Nile in the spring of 1849, and was caught as a gentle suckling by a party of hunters sent out by Abbas Pasba, then the Viceroy of Egypt. Obayseh first smiled on an English audience in 1850, when he was the lion of London. In 1853 the pretty Adhela was brought to him as a spouse, and several young hippos was the result of this happy union. But the majority or part of them could not stand British institutions, so but one hippo, born in November, 1872, is now living.

ANIMALS RECEIVED AT CENTRAL PARK MENAGERIE FOR WEEK ENDING APRIL 13, 1878.—One purple Gallinule, *gallinula martinica*, from Brazil, presented by Mr. J. L. G. Cannon, Westport, Conn.; one hybrid fowl, presented by Mr. Edmund Orgill, Brooklyn; one larger kill roynah, *Gracula intermedia*, presented by Mr. Chas. S. Wright, N. Y. City; one red-wing blackbird, *Agelaius phoeniceus*, presented by Mr. J. B. Ambrose, N. Y. City; one prairie wolf, *Canis latrans*, presented by Dr. A. Lantard, N. Y. City; one black-eared marmoset, *Hapale pentadactyla*, presented by Mr. W. R. Tice, Brooklyn; one megapode, *Megapodius pritchardii*. W. A. CONKLIN, Director.

ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDEN, FAIRMOUNT PARK, APRIL 9, 1878.—Two white rabbits, *Lepus cuniculus*, presented; eight garter snakes, *Eutania sirtalis*, presented; two water snakes, *Tropidonotus aspidon*, presented; two alligators, *A. mississippiensis*, presented; one common bittern, *Bolaurus minor*, presented; one red fox, *Vulpes fulvus*, presented; one kangaroo rat, *Hypsigymnus rufescens*, born in garden. ARTHUR E. BROWN, Gen'l Supt.

Woodland, Farm and Garden.

THIS DEPARTMENT IS EDITED BY W. J. DAVIDSON, SEC. N. Y. HORTICULTURAL SOCIETY.

WILD FLOWERS.

OWING to the earliness of the season, the wild flowers appear in wood and glen—by the brook and on the mountain side, and the lovers of nature are already haunting her secret recesses, exploring dingle and bosky dell, and making friends with each wildwood blossom that is awakened by the kiss of the advancing spring. We give a partial list of plants that may be looked for this month, in the hope that it may be of service to those who are disposed to treat themselves to the pure and deep delight of studying wild flowers the coming summer, hoping that, even if they do not form a herbarium, they will faithfully register these long names of their woodland friends. This is essential to the true enjoyment and understanding of this delightful pursuit. In April, about thirty species should be found:

Anemone nemorosa, Wind-flower; Hepatica triloba, Liverwort; Ranunculus fascicularis, Early Crow-foot; Ranunculus micranthus, Small-flowered Crow-foot; Thalictrum anemoneoides, Rue Anemone; Thalictrum dioicum, Meadow Rue; Caltha palustris, Marsh Marigold; Hebeborus viridis, Grecu Hebebor; Aquilegia canadensis, Wild Columbine; Sanquinaria canadensis, Blood-root; Viola pedata, Bird's-foot Violet; Viola rostrata, Long-spurred violet; Geranium maculatum, Wild Geranium; Anemone nuttalliana, Easter-flower; Tiarella cordifolia, mitre-wort; Amelanchier canadensis, Shad-flower; Fragaria virginiana, Wild Strawberry; Saxifraga virginiana, Early Saxifrage; Chrysosplenium americana, Golden Saxifrage; Asarum canadense, Wild Ginger; Dicentra cucullaria, Squirrel Corn; Claytonia virginica, Spring Beauty; Epigaea repens, Trailing Arbutus; Pyxidantha barbata, Flowering Moss; Arisaema triphyllum, Jack in the Pulpit; Potentilla canadensis, Cinquefoil; Myrica gale, Sweet Gale; Comptonia asplenifolia, Sweet Fern; Prunus maritima, Beach Plum; Zanthoxylum americanum, Prickly Ash; Acer rubrum, Red Maple; Erythronium americana, Dog's-tooth Violet; Taraxicum dens-leonis, dandelion.

AMERICAN WILD RICE IN ENGLAND.—We have the subjoined letter from Mr. Jackson Gillbanks, a well known authority in England on natural history subjects, which will much interest many of our readers, especially those sportsmen who are endeavoring to cultivate wild rice with a view to attracting wild fowl to localities which they do not frequent. Mr. Gillbanks is correct in his views that fresh seed is necessary for propagation. We have always pressed this point upon our readers' attention. Time seems to dry the vitality out of it. It should be gathered before the milk has quite disappeared from it, and sown as soon thereafter as practicable. While wild rice may be easily procured in a thousand localities, those localities are generally so remote from lines of transportation that the price is greatly enhanced by the time it reaches its destination. One must be on hand, too, to gather it just at the proper time. Rice Lake, in Canada, is the most accessible point we know of, having direct communication by rail. Manitoba is less accessible.—Ed.

WHITEFIELD, Carlin Co., England, March 23, 1878.

EDITOR FOREST AND STREAM:

Any one would suppose, judging by analogy, that all the vegetable products of Canada and its southern boundary would prosper and increase when brought from an inclement climate and placed in a better one—the similarity of soil and habits being duly observed. Thus we have had Canadian oaks, potatoes, and many of our best fruits, which have been a great boon to us. But this does not seem to be the case with the wild rice of that part of the world. Several notices have appeared in American papers that good and fresh gathered seed can be obtained of so and so. By this one would infer that there was no difficulty in its propagation—but there is. I having had much experience in the matter I find it my duty to say a few words thereon.

Some years back the British Government had a large staff of the Ordnance Survey (formerly we called them sappers and miners) setting out the line of demarcation between our territory and the United States; some of them on furlough reported that when they arrived at a district about the Red River settlement, the wild water fowl of all sorts swarmed to such a prodigious extent as to endanger and interfere with their leveling operations, and they evidently came to feed on a peculiar and luxuriant wild corn of some sort, which abounded in the swamps and marshes. This circumstance was brought before a meeting of some learned society in London, and some of the seeds produced which many there thought the discovery of an entirely new grain. I was at home at the time, and had heard nothing about it, but it was agreed that the matter should be put into my hands, as I lived among our Laker, if I would bother with it, and the seed was sent me, O. H. M. S., for experiment and distribution. I had applications for and sent parcels to all parts of Europe at a great expense—not a single appli-

cant inclosed stamps. I then consulted Moore (Moore & Bro., Ferns), who seemed to suspect what it was, and was first applicant, Dr. Hogg, of *Journal of Horticulture* (who detected it immediately), and others, who gave me all the assistance in the power. About the same time I had to go up to Cambridge to assist at a great entertainment we gave to the Prince and Princess of Wales. During that time I went fully into the subject with Professor Babington, who is a member of my own college, and a good friend. As he is Professor of Botany for the University, he had all the records of this plant, and dried specimens. The botanical name is *Zizania aquatica*—"Wild rice of Canada;" but I hold strongly that it is not a rice at all (the botanical name of that family being *Orzyza*) and an aquatic wild oat. It seems from our books that it was first noticed by Sir Joseph Banks, the great botanist sent out with Captain Cook. None of the seeds I planted ever vegetated, though tried in every mode, nor was any one else successful. We found that Sir Joseph had three seasons running in preserving the vitality of the seed till it reached England, and did not succeed till the King put a small Government vessel at his disposal, after which he brought over a lot of it in barrels of mud and water. After that he had a lot of it which did well at his residence near Locotot, but was lost after his death. Prof. Baldington also told me that they had a nice plot of it in the Old Cambridge Botanic Gardens. These had to be removed on account of the railway. A new pond was formed, which broke loose at the bottom, ran dry, and they lost it and all the rest of their rare aquatics. We found mention of it in several other places, but on inquiry it had all disappeared. We all came to the following conclusions: That, being an annual and a complete aquatic, it would not stand being dry for a moment—no longer than a deak out of water. Some very good authority wrote lately—I forget who and where—that simply bringing the grain in water alone did not answer, as the grain rotted and turned to a mass of conerva and fungus.

This is the result of my own experience with the seeds of other water plants. It sheds its own seed when ready, which seems to germinate immediately, but must have some soil for the roots to strike into there and then, or the fibres will all rot off and perish.

Another point worth notice is, that though the winter of the Northern parts of America are much colder than ours, the summers are much hotter, and grain and every sort of vegetation ripens and comes to maturity in an incredibly short time. This may have a good deal to do with the difficulty of establishing this cereal in England. Still it is well worth another trial. Surely, if Sir Joseph Banks could do it in the reign of George III., English and American botanists, with their advanced opportunities and skill and appliances, should do it easily now. What we all insist on as a sine qua non is that it must never receive a check. Collectors can bring the rarest and most gorgeous plants from the tropics, but not one of them like common wild oat grass from Canada. Shame on us all! I think open jars or tubs, with its native soil at the bottom, and doated efficiently with soft water, would be the best mode. I am also much surprised that, as all agree any quantity of it can be gathered for nothing, it is not sent to England as an article of trade, as poultry and game food. What I had sent me was far better and offered more meal than many a stack of oats after a bad harvest. There must be something prohibitory in the carriage from the swamps it grows in.

Any one who succeeded in establishing this grain about his lakes and marsh land would have all the wild ducks in the district, beside cheap food for game and poultry. JACKSON GILLBANKS.

QUITCH-GRASS.—Several correspondents have made inquiries about quitch-grass as a corrective for young dogs, wishing seed, methods of planting and so forth. We will enlighten them.

We don't know of any one familiar with the plant who wishes to propagate quitch-grass. On the contrary, they would prefer to root it out, except for pasturage. Properly named, it should be quick-grass, and is so called from its vigorous growth, or possibly from the difficulty of eradicating it. In the east it is known as knot-grass or joint-grass, but it is not the blue-joint of the West. It is very wiry, although succulent, and spreads by sending roots out of the knots into the ground. Botanically, it is known as dog-grass or couch-grass. Its leaves and stems are broad and green in spring; in the summer they turn reddish-brown and purple. It can be readily detected as it is composed of bunches growing out of the knots. It is the best corrective for dogs, cats and fowl which we know of, and it would be well worth while to cultivate a small patch of it, if it be not allowed to spread. The seeds can possibly be obtained at a botanic drug store.

FARMING IN MINNESOTA.—The very carefully prepared estimates of the cost and profit of starting and operating a 10,000 acre farm in Minnesota are attracting earnest and widespread attention. Such honest estimates, bearing on their face the evidence of experience and truth, and covering so fully the entire question, have never before been printed. We have been honored by applications for copies by the Governor, the Secretary of State, the State Statistician, and several other prominent parties in Minnesota. The gentlemen who prepared that estimate invite the co-operation of capitalists upon the basis given, and beg to refer to the advertisement printed in our paper under the title \$30,000.

A BLACK LILY.—The *Bermuda Royal Gazette* has this announcement of a rare flower, a black lily:

"The spadix, some 6 inches long, is perfectly black, with a spathe of a rich black tinge, afterward becoming moroon in color. This Lily has a much richer spathe than the one that opened a fortnight ago. These two plants, which flowered about the same time last year, were raised from bulbs, which Thos. S. Reid, Esq., procured in Jerusalem, in the spring of 1876, and sent to Bermuda the same autumn. The Lily, which resembles in a certain measure the Lords and Ladies found in the English hedges in the spring, Mr. Reid discovered growing wild in the waste paths between Hebron and Bethlehem."

A GOOD PLACE TO SETTLE IN.—Our Nashville, Tenn., correspondent writes that a lady by the name of Hopkins, living in Greene County, Tenn., has arrived at the great age of 117 years. She has three sons living who are aged respectively 88, 95 and 90 years.

—William Calcraft, the veteran English executioner, is very fond of flowers, and has a great many rabbit pets.

FOREST AND STREAM will be sent for fractions of a year as follows: Six months, \$2; three months, \$1. To clubs of two or more, \$3 per annum.

The Kennel.

TO CORRESPONDENTS.—Those desiring us to prescribe for their dogs will please take note of and describe the following points in each animal:

1. Age. 2. Food and medicine given. 3. Appearance of the eye; of the coat; of the tongue and lips. 4. Any changes in the appearance of the body, as bloating, drawing in of the flanks, etc. 5. Breathing, the number of respirations per minute, and whether labored or not. 6. Condition of the bowels and secretions of the kidneys, color, etc. 7. Appetite; regular, variable, etc. 8. Temperature of the body as indicated by the bulb of the thermometer when placed between the body and the foreleg. 9. Give position of kennel and surroundings, outlook, contiguity to other buildings, and the uses of the latter. Also give any peculiarities of temperament, movements, etc., that may be noticed, signs of suffering, etc.

FIXTURES FOR 1878—BENCH SHOWS.

Baltimore Kennel Club's Show, Baltimore, Md., April 23, 24, 25 and 26. L. R. Cassard, Secretary.

The Westminster Kennel Club (New York) Bench Show, Gilmore's Garden, May 14, 15, 16 and 17. Dr. W. Seward Webb, Secretary.

RAILROADS AND DOGS.

Dear Editor: We all know how constantly sportsmen are traveling over the various railroads accompanied by their dogs. Of some few of these railroads we do not complain, as the managers have been far-sighted enough to allow the dog a free ride with his master, and to give the proper orders to baggage masters that they shall not extort a fee to suit his own idea at his demand, or throw the dog off the train. In your valuable journal, heretofore, you have used your influence to correct this gross abuse of the dog and sportsmen by the railroad companies; and through that influence the few roads have made the better rules, and such roads are fully appreciated and patronized by brother sportsmen. But certain roads, which we could name, still allow the baggage masters to ruin the dog department of the road, and to do just as they please. Such roads are doing a great injustice to a good class of patrons. We are willing to pay a fair established rate, and only want to be informed what that rate is. We are not willing to be subjected to the whims of a baggage man, who can demand a dollar for a ten or twenty-mile ride for a dog. I hope you will continue your kind efforts to bring about some better regulations, especially in regard to roads in the vicinity of New York. Sincerely,

[This question of dog transportation is still a vexatious one, as our correspondent justly states. On a great many roads a dog is quite at the mercy of the employees. Quite fortunately, many baggage masters are something of sportsmen themselves, and take the best care of dogs, but we have more than once had reported to us cases of culpable negligence and even cruelty. There should be a charge made for dog transportation, so much a mile, and a proper place made for their carriage. To leave the sportsman to pay a fee at his option ought to be considered as humiliating to any railroad employee. It is not of course as much a case of revenue with a railroad company in regard to the dogs as a fixed price known before hand, and a good place for the dog, induces sportsmen to travel on the roads. We are acquainted with a certain good range of country in Virginia where there was a comfortable house kept by an obliging landlord, which has been shunned for the last two years on account of the exactions of a baggage master on a branch road. Sportsmen's clubs might agitate this question of transportation of dogs, and we should gladly give them all the aid in our power in order to set matters right. We are certain that it never will do to consider the charge of transporting a dog as one of the perquisites of a railroad employee.—Ep.]

WESTMINSTER KENNEL CLUB—SECOND ANNUAL N. Y. BENON SHOW.—The special prize lists will be ready for distribution this week. Many of them will be given to "Native Setters" only, and will be of the same value as those given in the regular classes. All the express companies have agreed to carry dogs at their usual rates to the show and return them free. The rates must in all cases be prepaid. The railroads are responding nobly to the solicitations of the committee, to carry dogs free when accompanied by a passenger. A full list of them will be sent you as soon as completed. The entries already received are sufficient to make up a good show. It is anticipated that long before the 30th the numbers will have reached the limit—viz., 940. The judges will be as follows: For English setters, pointers, mastiffs, St. Bernard's, Newfoundlanders, bloodhounds, greyhounds, dachshunds, fox terriers, bull dogs, bull terriers, Skye terriers, Pugs, Scotch terriers, black and tan terriers, Dandie Dinmont terriers, Yorkshire terriers and toy terriers—Wm. Lart, Esq., of England.

Black and tan setters, red or red and white setters, Irish water spaniels, retrieving spaniels, clumber spaniels, cocker spaniels, field spaniels and collies—John Davidson, Esq., Monroe, Mich.

For Siberian or Ulm dogs, Chesapeake Bay dogs, fox hounds, barriers, beagles, dachshunds, coach dogs, Bleckhelm spaniels, King Charles spaniels, Japanese spaniels and Italian greyhounds—Dr. L. H. Twaddell, West Philadelphia, Pa. CHAS. LINCOLN, Supt.

DOG TRAITS—Muirkirk, April 5.—Reading Mr. Eyrich's article in this week's *FOREST AND STREAM* calls to my mind several times when my dogs have backed out from a covey of birds and returned to inform me of the fact. The first time was in Nov., 1874. I was hunting with my black pointer bitch Meg, about eight years old, and liver pointer dog Pointo, 15 months old. The dogs had gone over a fence in advance of me, and on my entering the field after a slight delay, they were out of sight. Thinking I could easily find them, I looked all over the open fields, but no dogs. I then whistled for them, as if they were pointing game, I knew they would not return. The dogs did not come back, so I proceeded to search for them in a thicket of pines. I must have searched fully twenty minutes for them, every few minutes whistling and calling for them. I had about given up the job, when Meg came toward me, and when I asked her where she had been, started forward, but turned to see if I was

coming. She kept just ahead of me, and led me about 100 yards, alongside of a branch covered with brambles, to a crossing place, crossed over, and then back on the other side, about twenty yards, where the pup Ponto was pointing. On walking up to him a covey of partridges got up. I am sorry to say that I did not do as well as the dogs, for I only bagged one. Poor old Meg! She now lies buried in my lawn, under the shade of some fine oak trees. Since that time Ponto has very often returned to me after finding a covey of birds and finding that I could not make him out. He is not a field trial dog, but for a man who wants to have sport in the field, he cannot be beat—at least, that is what all my friends say who hunt with him. Yours truly,
CHAS. E. COFFIN.

TO CURE DOGS OF KILLING CHICKENS.—A correspondent kindly sends us the following: "Take the chicken that has been killed by the legs, and, after beating the dog with it, pass the legs each side of the dog's neck and tie the feet together, so that the chicken hangs securely fastened to his neck. After carrying the chicken around for a day or two the dog will be so thoroughly disgusted with chicken that he will not be apt to trouble them again." O. K.

WHELPS.—*Claremont, N. H., April.*—Mr. W. Jarvis' imported Irish setter Rose (champion Palmerston's Flora) has seven puppies—five hitches, two dogs—by Elcho. They were born April 5, 1878.

Boston, April 12.—T. T. Sawyer, Jr.'s, black and tan bitch Nelly, presented to him by the Massachusetts Kennel Club, has whelped nine puppies, by Allen's Reuben, he by champion Lang out of Rula; six dogs and three bitches. Nelly is by Stoke's Shot, out of Major Elwon's bitch of old champion Reuben stock, and was brought to this country by T. H. Scott, Esq.

—The Nebraska State Association will convene May 21, sitting two days. An effort is being made to inaugurate a dog show at the same time and place—Fremont. Bob WHITE.

THE BALTIMORE DOG SHOW.—The list of entries reached over 600 several days ago. There are many new exhibitors and much fine stock never before entered.

THE TIFFANY CUP FOR THE BALTIMORE SHOW.—This cup arrived too late to be included in the printed list of special prizes, but the club have decided to take entries for it on the first day of the show, and to give it to the best setter or pointer exhibited.

Yachting and Boating.

DOINGS AMONG THE YACHT CLUBS.

Yachting matters in New England are very brisk, and the outlook for the season a most promising one. The Boston Yacht Club, the oldest organization of the kind in the East, was organized in 1866, incorporated 1868. There have been added to the fleet this year: Sloops *Adrienne*, *Comfort*, *Riviera*, *Undine*, *Seabird*, and new schooner for Mr. John B. Mears; also the catamaran *Tarantula*. The squadron comprises seventy-seven sail, fifteen schooners and sixty sloops, including two steamers; number of members, 250. The spring regatta has been fixed for June 17, the fall regatta some time in September. The opening cruise, a very commendable feature of the club's programme, takes place June 13. Officers of the club for 1878: Commodore, F. H. Peabody; Vice-Commodore, Nathaniel Wales; Rear-Commodore, Andrew Robeson, of Fall River; Secretary, Thos. Dean; Treasurer, Aug. Russ; Measurers, D. J. Lawlor and J. B. Smith; Trustees, Hon. Benjamin Dean, Wm. B. Merrill, E. B. Phillips; Regatta Committee, F. E. Peabody, Clarence W. Jones, Wendell Goodwin, W. H. Bangs, Jr., and W. W. Kellett.

—The Eastern Yacht Club has a membership of 250, and a fleet of twenty-nine schooners, fourteen sloops and one steamer. Among its craft are the largest in Eastern waters, as well as many belonging to New York and Brooklyn. It is to Boston what the N. Y. Y. C. is to the metropolis. *Enterprise*, keel-cutter, *Undine* and *Ariadne*, sloops, have been added to the lists this year. The club's regular matches are to take place in June and September. Officers for 1878: Commodore, T. D. Boardman; Vice-Commodore, C. W. Emery; Rear-Commodore, David Sears; Secretary, Henry B. Jackson; Treasurer, Pat. T. Jackson; Measurer, Clarence W. Jones; Regatta Committee, Wm. Whitney, John Jeffries, R. F. Clark, R. H. Stevenson and R. Rollins Morse.

—The Beverly Yacht Club was organized 1872, and has now sixty-one boats flying its pennant. The membership is over 100, all active sportsmen, and practical hands at sheet and tiller. Their regattas have been fixed for the following dates: At Nahant, July 6; off Swampscott, July 27; off Beverly, Aug. 17; at Cotuit, Aug. 3; and again off Nahant, Sept. 7. Officers: Commodore, Arthur Burgess; Vice-Commodore, Geo. A. Goddard; Secretary and Treasurer, W. Lloyd Jeffries; Measurer, H. H. Buck; Regatta Committee, Wm. D. Hodges, G. P. Gardner, J. G. Minot, P. Grant, Jr. and W. L. Jeffries.

—The Dorchester Yacht Club has its club house at Commercial Point on Dorchester Bay. The club numbers 125 hands, and owns ten schooners and forty-seven sloops. It will hold its spring regatta off Nahant, June 17. Commodore, F. E. Peabody; Vice-Commodore, S. P. Freeman; Secretary, G. H. L. Sharpe; Treasurer, Coolidge Barnard; Fleet Captain, Geo. F. Clark; Measurer, H. Davenport; Trustees, C. E. Folsom, W. T. Adams, W. H. L. Smith; Regatta Committee, Coolidge Barnard, H. S. Mann and P. Dexter.

—The South Boston Yacht Club will hold a grand union regatta on Fast Day afternoon, open to yachts of all clubs, another on May 30, and on June 17 a match race to Marblehead. The club was organized in 1868, incorporated in 1877. Its members number 133; its fleet counts one steamer, seven schooners and thirty-nine sloops. Judges for union regattas, Wm. Morris, J. M. Flynn and Chas. Griffin. Officers for 1878: Commodore, M. J. Kelly; Vice-Commodore, L. S. Pond; Fleet Captain, Wm. McCormack; Secretary, Wm. Morris; Measurer, T. Christian; Trustees, J. H. Giblin, W. H. Laford, Dr. R. Dishrow; Regatta Committee, M. J. Kelly, Wm. Morris, J. G. Chambers, F. Copeland, H. P. Elwell, F. G. Cooley and J. Reagan.

—The Quincy Yacht Club is in a flourishing condition, and its prospects for a lively season are good. At a recent meeting the following gentlemen were elected: Commodore, H. A. Keith; Vice-Commodore, W. H. Nicholson; Secretary and Treasurer, Geo. W. Morton; Fleet Captain, Joshua Binney; Measurer, Peter B. Turner; Regatta Committee, B. F. Bass, Geo. W. Morton, Jas. T. Penniman and E. B. Souther.

—The East Boston Yacht Club has its headquarters at Island Ward and numbers about sixty members, with twenty-one boats. Preparations for the season are actively going on.

—The Portland Yacht Club, it gives us pleasure to announce, shows renewed signs of vigor. It has been incorporated recently, and a new club book is about to be issued which will show a creditable condition of the club's affairs. The squadron consists of ten schooners, fourteen sloops and two steamers. The annual club cruise is to come off in June. At Custom-House Wharf the club house has been refitted and renovated all through. Officers for the year: Commodore, J. P. Thomas; Vice-Commodore, H. K. Paul; Fleet Captain, John E. Bradford; Secretary, W. Winthrop Root; Treasurer, F. H. Jordan; Measurer, A. K. P. Cobb; Trustees, J. P. Thomas, C. W. Goddard, A. M. Smith, W. W. Gould. Regatta Committee, J. P. Thomas, J. H. Boyd, B. J. Willard, E. F. Willard, Th. K. Jones.

—The Atlantic Yacht Club has adopted the following classification of yachts for the coming year: Class A, schooners over 75ft. long; Class B, schooners under 75ft.; Class C, cabin sloops over 45ft.; Class D, cabin sloops under 45ft.; Class E, cabin sloops under 35ft.; Class F, open sloops; Class G, cat-boats; Class H, catamarans. In classes A and B, when not more than two yachts are entered for a regatta, or do not put in an appearance at the starting line, all schooners shall sail in one class, except in pennant or challenge races. Only fore-and-aft sail will be allowed, as heretofore customary. Yachts will give and take time according to length of measurement; this to be taken from a plumb at intersection of stem and water line to the extreme after end of counter or overhang. With the new rule in force, poor *Orion* and other craft of the fan-tail persuasion will pay dearly for their bustle attachments.

—The Williamsburg Yacht Club enters upon the present year's sport with a future full of hope and expectations. At the last meeting held in the club's snug boat-house, at Pottery Beach, Greenpoint, L. I., the question of prizes for last year's racing came up for final action. It was voted to expend \$60 in the purchase of suitable presents to the victorious skippers. The following yachts were declared entitled to the prizes: *Nettle*, *Crick*, *Pluck* and *Luck*, *Rosina* and *Mary Gibson*. The proposition to hold this season's matches on the 4th of June was accepted by the yacht owners, subject to ratification by the club. The course will be from the club house to Stepping Stone's Buoy and return. The Regatta Committee is to be appointed next meeting, and a full attendance is sure to call forth the best efforts of Mr. John C. Van Brunt, the club's very able president, who has parliamentary law at his tongue's end, and who is quite equal to keeping within bounds any superabundant enthusiasm likely to develop in half a dozen members or more under exciting influences. The membership of the club is ninety-seven, fortunate in not owing a dollar, their financial craft with decks clear for action in '78. The club house, large and commodious, is built upon a scow, and is composed of a two-story building, the lower deck being devoted to lockers and storage, the upper to the debating-room. The latter is handsomely fitted up, and contains many pictures in oil and water colors, representing deeds of derring-do of many a famous clipper with the club's burgee at the peak. Near headquarters, the smooth, sandy beach of the cove, running along for nearly a mile, gives all that a yachtsman can desire for hauling out his boat, while the handy shops of "Jake" Smith are equal to any kind of a job on hull or spar. Only recently his famous turn-out, *Pluck* and *Luck*, was bought for her speed and sent to Southern seas to weave new wreaths of victory around her builder's brow in contests with smart ones of *Bella's* stripe, who have hitherto had things too much their own way down on Crescent City waters. The lists show the following yachts enrolled in the Williamsburg Yacht Club: *Sorceress*, 34ft., Commodore Goodenough; *Julia G.*, 42ft., T. Merritt, Esq.; *Melvina*, 42ft., A. Barker, Esq.; *Nettle*, 26ft., A. Pennock, Esq.; *Endavor*, 27ft., Smith & Billard, Esqs.; *Rosina*, 19ft., G. Barker, Esq.; *Inspector*, 24ft., Wm. O. Davis, Esq.; *Martina M.*, 24ft., Geo. Munn, Esq.; *Pigeon*, 21ft., Peter Luth, Esq.; *J. N. Manfield*, 22ft., A. J. Brush, Esq.; *Katy*, 23ft., Vice-Commodore Coleman; *Maggie*, 28ft., G. W. Forbes, Esq.; *Gilbert J. Orr*, 18ft., W. O. Davis, Esq.; *Jane*, 16ft., Chas. Bulk, Esq.; and several new craft to be added. The club colors consist of a triangular burgee, blue ground, red border, and white star in blue field.

COLUMBIA YACHT CLUB.—On North River, at the foot of 86th st., the Columbia Club is busily engaged preparing their fleet for all business in the way of speeding that may come along. The members propose to meet among themselves some time between the 15th and 22d of June and take a competitive spin over the usual course, club house to Yonkers and return, a distance of 23 miles. Their annual regatta is an event looked forward to with happy anticipations by society in the neighborhood, the day of the match being to the families and friends of the members a red-letter day of the year.

The club-house has been built on a stone pier jutting out into the river about 100ft. The pier belongs to the city, but the right to use it has been granted the Columbia by the Dock Department, and a finer location for them it would be difficult to find. The house is a two-story frame structure, 36x22ft. The lower floor is occupied by lockers and storage room, the upper being set apart for meetings and the ladies. It is tastefully furnished, the ceiling frescoed and walls decorated with yachting pictures. Among the latter is an English lithograph dating back into the thirties, representing a match between two olden-time cutters, with their bluff bows and square tucks and counters, a reminder of the sport in its most youthful days, and a relic as suggestive as it is valuable. A balcony runs across the front of the building, affording a fine view of the entire course and a breezy retreat warm summer evenings where to spin yarns without end on the inexhaustible topics so dear to sporting amateur tars. The officers elected for 1878 are: Jerry S. Baker, Commodore; R. McWhinny, Vice-Com.; L. Wigman, Acting Secretary; J. A. Weaver, Treas.; J. Geason, Measurer, and Ph. Houseman, Steward. The fleet includes the cabin sloops *Emma T.*, flying the Commodore's broad pennant; *Emma* and *Clara E.*, and the open boats *Lilly*, *Journeyman*, carrying the Vice-Commodore's signal; *Nettle*, *Laurel*, *Lydia T.*, *Au Revoir*, *J. McCready*, *Gem* and *Columbia*. Among them several well known crafts will be recognized. *Emma T.* is a speedy boat, and can hold her own with most anything of her size, while as a cruiser and sea-boat she leaves nothing to be desired. Her skipper has been reducing her spars this spring, but it is to be hoped that this is not intended as equivalent to the withdrawal of his racing colors from the line of starters in his club. Her hull will remain as before, and is not undergoing alterations as previously reported. *Journeyman*, one of the fastest of her class, is receiving her third suit of canvas, and her owner expects to put her through a course of lively doings in the next few months. This famous boat, though in her seventh year, has preserved her lines perfectly, and her skin and seams are as fair and smooth as when she first left the ways at Richard Wallen's. Her length is 28ft. 8in., and beam 11ft. 6in. The new rig will consist of jib and mainsail, length on boom, 35ft.; head, 17ft.; hoist, 24ft.; jib, 22ft. 6in. on leech and 42ft. on luff. Eight ounce duck, double-bighted, will be used, making the bights about 8in. apart. *Journeyman* has a fine record, and her plate locker contains among many others the club prizes for 1873, '74 and '76. Last year she was beaten owing to carrying too much ballast, which she was obliged to lug over the course in accord with one of the sailing rules, allowing no dumping of ballast after the starting gun. Usually she stows away about 1,400 pounds in her floors for cruising purposes, aside from shifting sand bags. Ex-Com. Nobles may give *Journeyman* and others some hard work ere long with the new flyer Wallen has in hand for him, for the latter has a wholesome looking form and ought to be a good one in a breeze and the short lop of the Hudson. The *Laurel* is new likewise, and though a handsome piece of workmanship, it remains to be seen what speed she will show, her great beam rendering her chances for a eup somewhat questionable. *Nettle* was built by Wallen, South Brooklyn, and measures 24ft. 10in. The club's burgee consists of a swallow-tail with blue triangular field at mast and two similar ones in red forming the tails and a white star in each field.

—The Empire Yacht Club met at their club-house, foot of 104th street, Harlem, and settled upon June 19 for their annual regatta. Thirty-five sail will enter for this race. The course will be from the club-house around the spindle buoy off Throgg's Neck, and return.

—The Brooklyn Yacht Club, at its last regular meeting, elected Mr. R. K. Huntly, of the sloop *Nianin*, their Rear-Commodore, in place of J. B. Norris, deceased. Mr. H. H. Lamport, Vice-President of the Continental Insurance Company, was elected a member, and ex-Commodore G. L. Haight was chosen an honorary member. The location of the new club-house was referred to the trustees, with power. Section 8, of the sailing regulations, was amended to read: "The allowances of time for second and third class boats to be based on length only, one-half of overhang aft included in measurement." The majority of clubs seem to be laboring heavily under the task of settling upon a clear, concise and equitable rule for measurement, for at every other meeting the matter is brought up by some member. A desultory discussion ensues, and those present are only too glad to get the whole subject off their hands by consenting to the proposition made and allowing the too inquisitive member to have his way—anything to keep the thing quiet and to save too much headwork. It is not our purpose to enter at length upon this very protracted question, but as long as a club has fixed upon length as the basis of measurement, it seems very simple to arrive at the only system which will really represent the length of a yacht, and that is the plan which does not result merely in giving time on any one particular length, but on the average length of the boat in all respects, keeping in view the only plea upon which mere length measurement is admissible—that of simplicity. To attain the average length, no matter to what class a yacht may belong, add the length of load line to that over all and divide by two. That is the whole operation in a nutshell. If the question arises as to what constitutes length on load line or overall, the answer is as readily given, admitting of no circumvention or doubt. Length on load line is the length on the normal line of flotation, from forward side of stem to after side of stern-post or counter, if immersed. Length over all includes the distance from forward side of stem, at deck height, to extreme after end of yacht, be it rail or counter or deck. Half the sum will represent about as fair an estimate to grant time on as such a crude and haphazard system will admit of. We hope, however, that the day is not far distant when a little more equitable and rational rule of measurement will be enforced. At present each club follows its own particular bent, with nine out of ten of them all at sea.

ROYAL HALIFAX YACHT CLUB.—Our Canadian friends, short as their season is, so near the Frigid Zone, manage to get a good deal of sport out of their craft, and it gives us pleasure to announce an increase to their membership and sail. The following officers have been elected for this season: Com. His Excellency the Earl of Dufferin, K. P., K. C. B., P. C., Governor-General of Canada. The Commodore will hoist his colors at the masthead of the *Danvers*, cutter. Vice-Commodore, S. A. White, Esq., of the *Kestrel*, yawl; Rear-Commodore, J. W. Stairs, Esq., *Torpid*, schooner; Secretary, F. C. Sumichrast, Esq., of the *Mystery*, sloop; Sailing Committee, Flag Officers and Secretary *ex officio*, Lt. Col. Clerke, D. Cronan, Esq., of the *Abbatross*, schooner, G. A. Black, Esq., of the *Petrel*, sloop, G. E. Capel Cure (Twentyeth Reg.) and L. Briand; Measurers, J. E. Butler and W. H. Throop. The following are the fixtures of the club: Opening cruise, June 16; spring match, June 21; harbor cruise under Flag Officer,

July 20; same, Aug. 3; summer match, Aug. 24; harbor cruise under Flag Officer, Aug. 31; fall match, Sept. 7, and closing cruise, Sept. 21. From this varied programme the members will manage to get all the sport they want, while the mixed nature of the fleet, composed as it is partly of British cutters and yawls and partly of American sloops, will render the matches of the most interesting character and very instructive in their results. We will keep our readers advised of the season's doings among the fleet.

—The New Jersey Yacht Club has elected the following officers: Commodore, E. W. Ketcham; Vice-Commodore, J. H. Rogers; Recording Secretary, A. Jeanneret; Financial Secretary, B. Kirch; Treasurer, C. F. Rogers; Measurer, G. E. Gattland.

YACHTING ITEMS.

A SEA-GOING SCHOONER.—Schooner *Nettie*, well known in connection with her former owner's cruise to Nova Scotia waters, and soon about to put to sea for Europe, measures, since her rebuilding by the Poillonas, 84 ft. over all, 71 ft. on load line, 22 ft. beam, 8 ft. hold, 8 ft. 2 in. draft of water aft. Her tonnage N. M. is 116.27; forecast deck to hounds, 57 ft., head, 7 ft.; mainmast, trunk to hounds, 57 ft., head, 7 ft. 6 in.; foremast, 27 ft. 6 in., pole, 18 in.; maintopmast, 28 ft. 6 in., pole, 18 in.; bowsprit outboard, 14 ft.; flying jibboom, 14 ft. outside of cap; pole, 3 ft. 6 in.; fore-boom, 22 ft. 9 in., gaff, 22 ft. 6 in.; mainboom, 53 ft., gaff, 23 ft. 10 in. From these figures it will be seen that the *Nettie* is well prepared for her foreign voyage. Her model is in accord with sound principles, for she has only moderate beam and a reasonable amount of depth, and her spars are of modest dimensions. She is one of the few yachts we possess which may really be designated as "sea-going."

—Everson is sailing together a catamaran 21 ft. long, which he proposes to sail in the N. Y. Bay Regatta. Too small to stand much of a chance.

FLYER UNDERWAY.—*Tarantella*, one of the new-fangled Siamese twins, made sail Sunday, the 7th inst., during the stiff blow, her owner, F. Hughes, Esq., at the helm. The way this double huller ran the line off the reel was truly a caution. At times it wasn't so much what she was logging as what was the best way to catch breath and to keep your hair on. Like the rest of her peculiar breed, the weather hull had a predilection to circus performances, and once in a while would attempt to veritably walk off on its ear. This superabundant ebullition of temper was cured by stationing one poor unfortunate at the after end of the weather hull, who, while soaked with the briny, had to console himself with the consciousness of his noble self-sacrifice at the altar of terrific speed. At times the catamaran was fairly lifted from the water and shot ahead with astonishing rapidity. When flying before a puff she must have run off as high as 18 knots and more. To what extent this kind of craft will find favor among the public remains to be seen; though since there is always in the community a large class who love everything bordering on the wonderful, we expect soon to see quite a fleet of these marvelously fast ones about our bays and rivers. *Tarantella* met another of her ilk, the *John Gilpin*, Mr. Fish owner, and gave her a lively brush down the bay, round Fort Lafayette and return to Gowanus. The *Tarantella* lapped *Gilpin* by about a length at the finish. Time, 44 m.; distance 12 miles.

HANDICAPPING CATAMARANS.—Mr. N. G. Herreshoff, inventor and builder of the independent universal-jointed catamarans, in his letter to the N. Y. Bay Regatta Committee, suggests 58. per foot per mile as time allowance for double hullers. So far as the data at hand enable us to form any conclusions, Mr. Herreshoff's proposal seems about equitable, at all events until a greater variety of matches will have afforded more ample and specific reasons for adopting another schedule. Right here let us correct a misapprehension that has got abroad concerning the letter in question. It seems that the proposal for including the length of course has been overlooked by many, and consequently an adverse verdict too hastily rendered, while on the contrary the allowances proposed seem fair enough.

NEW YORK BAY REGATTA.—At the meeting of the N. Y. Bay Regatta Committee, held April 10, it was concluded to have the committee boat, *Fort Lee*, go around the course. The latter has been adopted as follows: Stake-boat off Hunt's Dock, Gowanus, around channel buoy off Robin's Reef, thence around stake-boat in Gravesend Bay, opposite Bath Hotel, $\frac{1}{2}$ mile off shore, and return to starting point direct—in all, a spin of 20 miles. To be sailed over twice for the first three classes. The fourth class will round a boat anchored off Fort Lafayette, instead of reaching out into the rougher water of Gravesend, otherwise the course for fourth class to be same as for others. Catamarans will have to work their way through the narrows like the first three classes, and if there is a little chop on outside there will be some lively dustings aboard those wicker-work phantoms. An excellent and much needed opportunity would also be presented of comparing their performances alongside the old-fashioned boats with bottoms in them, but alas! hopes for a shorter are slim, fickle breezes and slants the probabilities for June. Time allowance for catamarans 1 m. to the foot. Only cat-boats allowed in the fourth class, limited to their mainsails.

—Sloop *Addie Voorhis* is being altered to a schooner at Northport, L. I., according to said plans furnished by A. Carey Smith, Esq. She will come out under a new name.

NEW YACHT ENGINE.—Hanson's patent yacht engine is a neat and compact arrangement for small yachts and launches. All parts are so arranged that a single hand can fire, run the engine and steer at the same time, everything being within his reach. The engine is of the single inverted cylinder type, and has the feed pump placed in between the frame supporting the cylinder, the connecting rod being forked or dotted in wake of the pump. In rear of the cylinder is the feed water heater, all valves being within handy reach of the engineer so that he can send the exhaust up the chimney or into the heater, while the pump will either work directly to the boiler or first through the heater as desired. The engine is fitted with one eccentric only, it being reversed by means of prolonging the shaft and connecting the latter by means of a ratchet and spur-wheel to an upright shaft with a lever handle on top. By working the lever the position of the eccentric is easily shifted and the engine reversed. Should it be caught on the centre it can readily be thrown off by a clutch lever working by friction on the end of the shaft next the engineer. The whole design is ingenious and of considerable practical utility for yachts, steam cutters and small launches.

—Sloop *Sadie*, owned by John B. Norris, Esq., deceased, was sold by auction last Saturday to Mr. Wm. A. Cole, President N. Y. Produce Exchange. The bidding started at \$500 and rapidly ran up to 2,375, the well known character of the

boat bringing for her a fair price under the circumstances. *Sadie* is 36.58 tons; length, 50 ft. 9 in.; on load line 47 ft. 5 in.; beam, 16 ft. 2 in.; hold, 6 ft. 3 in.; built in 1867 by J. B. Herreshoff, of Bristol, R. I.

—From our Kingston, N. Y., correspondent we learn the following:

"Mr. Dwight Knapp is altering his square stern yacht *Annie*, and is putting a projecting stern on her. Wm. Devlin is also altering his yacht, the *Kate H.*, and running out her bow. They are getting ready for the Newburgh regatta in the latter part of June, and the New York Bay regatta in July. The *Annie*, a 30 ft. yacht, is under the command of Commodore Wm. Mackay, and the undersigned one of the crew. OUR HARRY.

YACHTING DRIFT.

A new racing jib and mainsail, the *Wm. Levere*, is being built foot of 18 ft. st., E. R., to enter the lists for the N. Y. Bay Regatta. Length, 27 ft. 6 in.; beam, 12 ft. 2 in.; hold, 3 ft. 2 in. Another one, the property of Mr. R. B. Hartshorne, was launched at New Rochelle. Length, 27 ft. 4 in.; beam, 12 ft. 2 in.; hold, 3 ft. 2 in. *Promiss*, steamer, has received her engines. They are compound. High pressure cylinder, 13 in. diam.; low pressure, 21 in.; stroke, 16 in. Fearon, of Yonkers, has got out a catamaran. Length of hulls 26 ft., 35 in. wide and 22 in. deep. They are placed 15 ft. apart between centres. Her mast is 26 ft. deck to truck; boom, 26 ft.; hoist, 19 ft., and gaff, 14 ft. She carries no jib. New Bedford Yacht Club has a fine club house on Fish Island. Mr. J. Bell, of the N. J. Y. C., is having a new racing jib-and-mainsail built at foot of 5 ft. st., Hoboken. She is 24 ft. 10 in. long. Sloop *Addie Taylor* has been re-rigged. Mast, deck to cap, 30 ft.; bowsprit outboard, 16 ft.; boom, 28 ft. Sawyer is to fit her with muslin. Mr. F. P. Osborn's schooner *Nettie*, N. Y. Y. C., has been on the ways at City Island for an overhauling preparatory to making sail for Europe. The sloop *Wave* was the first to show the Atlantic colors aloft this spring. *Atlanta* schooner will cruise to Labrador this summer. *Susie S.*, the famous crack jib-and-mainsail, will not appear under racing colors this year. That will give some of the rest a chance. *Susie* was decidedly too smart for the ruck. Launched at Tottenville, S. I., Tuesday last, the s. s. yacht *Gilbert C. Deane*, owned by Mr. C. Walker, her builder. She is 50 ft. keel, 57 ft. on deck, 12 ft. beam and 5 ft. hold, drawing 3 ft. 6 in. aft. She will receive a vertical boiler and inverted single cylinder engine. Propeller 42 in. diam. The new steam-yacht *James Sampson*, built by Eugene Smart, has been launched at Dover, N. H. She is a handsome and staunch little vessel, and her christening attracted considerable attention in the neighborhood. A description of this steamer will be found in a previous number.

THE OAR AND PADDLE.

DETROIT ROWING MATTERS.—Our regular Detroit correspondent sends us the following Western news: At a meeting of the Naval Board of the Detroit River Navy, held at the Russell House, April 9, with Commodore Allen in the chair, permanent designs for prizes were adopted. The Michigan Boat Club was admitted to membership of the Detroit River Navy, and the Board then adjourned. Subsequently the River Navy held its meeting, when seventeen delegates submitted their credentials. Ten clubs are now enrolled in the Navy. The treasurer reports a flattering condition of the finances, and the organization looks forward to an interesting season.

THE CAMBRIDGE-OXFORD RACE.—The thirty-fifth race between the university crews of Oxford and Cambridge took place on the date fixed, April 13, during the forenoon on the last of the flood. The morning broke bazy and the day was somewhat sultry, but calm, and the Thames smooth until near the close of the race, when a slight breeze caused a little lop, but not enough to interfere with the oarsmen. The course was the usual one, from Putney to Mortlake, four miles and two furlongs. Cambridge had the best side of the water, the Middlesex, while Oxford was on the Surrey shore. Betting was heavily in favor of the Isis crew, the odds being as high as four to one. Cambridge caught the water first and went off with a quick stroke, and soon took a slight lead. At Bishop's Creek they were half a length ahead of the Southern men. Three furlongs above, at the lower end of Craven Cottage Garden, the Oxford made a spurt, having hitherto kept well within themselves, and rapidly overhauled the Cantab crew, both passing Rosebank Villa, how and how alike. But the dark blues had the best of it; the Cambridge crew showed signs of being used up, and off the Crab Tree, one mile and two furlongs from Putney, Oxford drew out ahead, the light blues pulling wildly and irregular. Off the Soap Works the Isis crew were rowing right away from their opponents, and led under the famous old Hammersmith Bridge by about two lengths. The race was now completely in hands of the Oxford crew, and they apparently took matters easily, as the time of the race also shows. Passing Chiswick Church, two miles and five furlongs from Putney, the lead had reached half a dozen lengths, and at Barnes Bridge about ten. At the finish, Oxford crossed thirty-five seconds ahead, heating the Cambridge crew by many lengths. Time, 23 m. 17 s. The crews were very evenly weighted, Oxford bringing down the scales at 1,477 lbs. and Cambridge at 1,481 lbs. This makes, in thirty-five contests, eighteen victories secured by Oxford and sixteen by Cambridge. Last year's race, it will be remembered, resulted in a dead heat.

WATKINS' REGATTA.—The representative races of the Watkins' Regatta Association will be open to amateurs, and comprise starts for four-oared, pair-oared and single-shell shells. Winners of these races will be sent to England and France at the expense of the association. Course will be one and five-sixteenths of a mile straight away, two boats to start or no race. Entrance fee for fours, \$20; pairs, \$12; singles, \$8. The laws of N. A. of A. O. will be observed, excepting rules 13 and 14, which may be suspended at the discretion of the meeting, May 23. These rules, it will be remembered, relate to awarding the prize to a crew not first in, should others have fouled; but the Watkins' Association, in order to insure sending the best crews abroad, may suspend this rule should it be evident that one of the crews fouling is superior to the crew winning, if rules 13 and 14 were in force. In that event the race will be rowed over again. Boats and their crews will be taken free over all lines of railroad leading to Seneca Lake. Hotel charges are very reasonable at Watkins, and no doubt the event will come off with considerable eclat. All information can be obtained by addressing J. H. Drake, chairman reception committee, Watkins.

—The Schuylkill Navy Regatta, for 1878, will be held at Philadelphia, Saturday, June 8, and will be conducted under the rules of the N. A. of A. O. Race over the National Course, one and a half miles straight away, for the well-known challenge prizes of the Schuylkill Navy and presentation medals for each of the winning crews. Entries from

clubs only; entrance fee for fours, \$15; pairs and doubles, \$10; singles, \$5, which will be returned to all boats starting. Entrance lists close May 25. Quarters for boats free.

The Henley International Regatta is evidently a misnomer. Henley National Regatta, limited, is the proper title for a match in which the international feature has, through the interferences of a few barmale conservatives and narrow-minded, straight-laced sticklers for ancient caste, been virtually thrown out altogether. Our latest information still fails to show any retractions of, or disposition to retract, the obnoxious, not to say ridiculous, stipulation of an extra six-week's notice required by the Henley stewards from American crews desiring to enter for the Steward's Challenge Silver Goblet and Diamond Sculls. Since the Watkins' trial races take place May 28, 29 and 30, and the Henley regatta July 4, it is simply impossible for American crews to give the notice so unjustly and unwisely called for. The Henley stewards, through their action, seem to take no very complimentary view of American oarsmen or their qualifications as gentlemen; a willful slight which Americans, were they less generous and forgiving in their natures, would not be slow to resent. The deduction of what constitutes an amateur is far more strictly enforced in America than the pseudo acceptations in vogue in England, where the only condition demanded seems to be that of a certain social status by birth, no matter how unworthy a person, or how ingenuitously in his affiliation with professionals this fledgling of a decaying aristocracy may be. But it is not necessary here to enter further into the amateur question at all; suffice it to say that the rules of the N. A. of A. O., and the many provisions based upon them, are within the reach of English authorities, including the Henley fossils, for the small sum of twenty-five cents; and if Englishmen take umbrage at the manner in which their recent actions have been received by Americans, and the burst of indignation, not to say contempt, they have called forth, let them bear in mind that willful perversion of the truth in their prints, by irresponsible correspondents, cannot any longer be accepted by Americans as grounds excusable, exculpating the British authorities from the responsibility of affront to the American rowing public, and of the insinuations current here of predetermination, through fear, against oarsmen from this side of the Atlantic. We believe the whole questionable proceedings at Henley can be directly traced to the machinations of the badly discomfited and sour-tempered individuals from the Thames who lost their laurels at Philadelphia in 1876. If the Henley stewards wish to retrieve their blunders, and not allow the stigma of cowardice to settle upon the fair name of English oarsmen, as it most assuredly will do under the present state of affairs, they must cease their irresolute policy at once, and welcome to the starting line all who come within the limits of the universal acceptance of the meaning of the word "amateur" in sports.

NEW YORK CANOE CLUB.—The New York Canoe Club, which was established in 1873 with seven members, has gained great deserved popularity, and now has a membership of thirty-six, with twenty-eight canoes. The Executive Committee are now negotiating for the purchase of a suitable club house, the popularity of the club warranting such a move. The regatta of the season will be held at Flushing Bay late in June. We give below a list of the members: W. L. Alden, Montgomery Schuyler, M. Roosevelt Schuyler, New York; J. H. Kidder, Charles H. White, W. T. Burwell, John Riel, R. P. Paulding, U. S. N.; J. E. Roosevelt, A. Roosevelt, F. Sherman Smith, L. F. Timmerman, C. L. Norton, W. O. Strong, J. A. Bayley, W. T. Cameron, W. C. Southwick, S. B. Pomeroy, John Habberton, D. B. Lee, T. H. Upton, J. Stillman, E. B. Bronson, Herbert Hazard, D. C. McEwen, H. G. Fiffard, A. L. Smith, John L. Logan, Obas, E. Chase, New York; J. S. Mosher, Albany, N. Y.; G. L. Morse, Yonkers, N. Y.; L. W. Ledyard, Cazenovia, N. Y.; J. Hyde Sparks, England; W. O'Sullivan Dimpfel, Baltimore, Md.; Andrew Devine, Brooklyn; Eugene A. Guilbert, Danbury, Ia.

ARGONAUT ROWING CLUB.—The Argonaut Club, of Toronto, has elected the following officers: Pres., Mr. Henry O'Brien; Vice-Pres., Mr. Roger Lambie; Capt., Mr. W. H. L'Arram; Sec. and Treas., Mr. T. W. Fisher; Asst. Sec., Mr. J. L. Capreol; Com., Messrs. C. E. Ryerson, Dr. Spragg, Philip Todd, L. H. Robertson, J. A. Healy, R. P. Palmer, Geo. F. Galt.

ROWING RIFLES.

—The Columbia crew is having a new ship put together by Fearon, of Yonkers, and Donoghue, of Newburgh, is whitening out some spoons for them. They will be 12 ft. long and 7 lbs. weight. Messrs. Sage, Eldridge, Ridglock, Edson and their excellent captain, Goodwin, are putting in some good daily work. Mutuals, of Albany, will send a four to Seneca Lake. Boat, by Fearon, 41 ft. long 20 in. wide. The Camansville four will be made happy with a new paper shell by Waters & Sons. Nereus Rowing Club, of Flushing, have elected the following officers: President, L. M. Franklin; Vice-President, Chas. Lever; Treasurer, C. A. Willett; Secretary, J. Q. Thompson; Captain, J. A. Walker; Lieutenant, F. A. Guild. Scharff is ready to accommodate Haulon, of Toronto, "at the proper time," whatever that may mean. Yale has declined to compete at Watkins, so that any crew they may send to Europe cannot go as the American champions. Quaker course Yale has taken. Harvard and Yale have agreed to the terms proposed by Mr. Bentley on the part of the New London public and railroads, and so the great varsity race will be pulled on the Thames this year. Rather a curious coincidence with the name of the river that yearly sees the greatest of aquatic meetings in the old country, and between its own universities too. Silver Lake Regatta, Boston, takes place May 30 and June 17. On the latter date amateur six-oared crews will pull for the Boston Herald cup; N. A. of A. P. rules govern. Trickett will row any one who will go to Australia for £500 to £1,000 a side, allowing £150 to £300 for expenses, win or lose. Wm. Elliott, Robt. W. Bayd, Wm. Lunsdale and Wm. Nicholson form a new team of crack professionals on the Tyne, Eng. Look out for them. Columbia Freshmen turn their noses up at a challenge from Harvard, in revenge for Harvard's action toward the Columbia University crew last year. Chicago Barge Club propose putting up their new house, foot of Peck Court. Eureka on the Passaic are training actively. James Reilly, of Saratoga, is in training, waiting for some one to turn up against him. Vesper Boat Club on the Merrimac numbers over 100 members. Boston City will give its regular annual contests July 4. Could not New York's sleepy City Fathers be stirred up to similar laudable undertakings? Rutgers College hopes to send a strong crew to Watkins. Never was the outlook for boating brighter than this spring. Atlantic Boat Club, of Hoboken, have elected the following officers: H. Offerman, Pres.; J. Hagemeyer, Treas.; J. A. Reed, Secy., and Chas. Erlenkotter, Captain.

Sea and River Fishing.

FISH IN SEASON IN APRIL.

Speckled Trout—*Salmo fontinalis*. Land-locked Salmon—*Salmo gairdneri*. White Perch.

FLIES FOR APRIL.

BLACK GNAT, OR MIDGE.—No. 13.—Body and feet black, wings subhyaline.

DARK CLARET GNAT.—No. 13.—Body dark claret, feet black, wings subhyaline.

BRIGHT CLARET GNAT.—No. 13.—Body bright claret, mixed with red fox face, feet ginger, wings of one sex hyaline, the other ochraceous.

GRAY GNAT.—No. 13.—Body dark fox, mixed with dark claret, feet gray, wings hyaline.

DARK FOX.—Nos. 10 or 11.—Body and feet dark fox, mixed with lemon colored mohair, wings subhyaline, tail three fibres of dark gray hackle.

POOR MAN'S FLY.—Nos. 9 and 10.—Body and feet, hare's ear and yellow mixed, wings slightly mottled gray, tail the mottle of the wood duck.

OLIVE GNAT.—No. 13.—Body dark olive, mixed with bright claret, feet ginger, wings hyaline.

RED FOX.—Nos. 10 and 11.—Body fox cub face, mixed with yellow, feet red (chicken red), wings pale gray or subhyaline, tail mottled feather wood duck.

BRIGHT FOX.—Nos. 10 and 11.—Body and feet brightest part of the fox, mixed with yellow, wings brightest hyaline, tail pale yellow.

BLACK HACKLED FLY.—Nos. 9 and 8.—Body orange, ribbed with gold tinsel, hackle black wings, tail of the American partridge.

GENERAL FLIES.

IRIS.—No. 8.—A hackle fly, ribbed with silver tinsel, body hackle, wings and tail scarlet.

PEACOCK PALMER.—No. 8.—Body peacock herl, hackle black and red mixed.

GRAY PALMER.—No. 8.—Body peacock herl, dark gray hackle.

PROFESSOR.—Nos. 8 and 9.—Body bright yellow, feet golden brown, wings wood duck and mallard, dyed yellow, mixed, tail scarlet ibis.

QUEEN OF THE WATER.—Nos. 8 and 9.—A hackled fly; body orange ribbed with gold tinsel, hackle chicken red, wings bright mottle of the mallard.

GRIZZLY KING.—Nos. 8 and 9.—A hackle fly; body green, hackle dark gray, tail scarlet ibis, wings mottled feather of the pin-tail.

FISH IN MARKET—RETAIL PRICES.—Our quotations are as follows: Striped bass, 20 cents; large do., 15; smelts, 15; blue fish, 15; frozen salmon, 30; green do., 55; mackerel, large, 25; do. small, 15; Southern shad, 25; native, 35; Connecticut River, 75; white perch, 15; Spanish mackerel, 25; green turtle, 15; terrapin, \$15; frost fish, 6; halibut, 11; haddock, 6; codfish, heads off, 6; do. heads on, 5; black-fish, large, 15; herring, Newfoundland, 6; flounders, large, 10; do. small, 6; eels, large, dressed, 18; lobsters, live, 8; do. boiled, 10; sheepheads, 25; turbot, 20; scallops, \$1.75 per gallon; soft clams, per 100, 30; do. large, 60; whitefish, 20; pickerel, 15; perch, yellow, 8; salmon trout, 15; Canada brook trout, 25; Long Island do., \$1; hard crabs, per 100, \$3; soft crabs, per dozen, \$3; prawns, per gallon, \$1.

The yield of shad from the North River here has been so far very slight, and the fish from the Connecticut have not been plenty. On Monday two schooners arrived with the first fresh mackerel, and on Sunday four more. Fish quite small. The consequence was that the price of shad fell immediately.

WHITEBAIT IN NEW YORK.—As early as 1873 it was announced in the *FOREST AND STREAM* that whitebait was not foreign to our waters. This statement was made on the authority of J. Carson Brevoort, Esq., who, as early as 1854, had declared that fish precisely like those in which Prime Ministers delight at Greenwich, had been brought to him by an English fisherman, who had caught them in New York Bay. Yesterday some of these same fish were given to us by E. G. Blackford, which were caught in New York Bay, and we now revel in the idea that it is not only on the banks of the Thames that the superlative whitebait can be eaten, but that before long, beside the Hudson, epicures may enjoy their good little fish. Of course we may expect a long discussion on this subject, "What are whitebait?" It was sometime in 1828 that Yarrell first threw the bone of contention into the ichthyological arena. Before an article of Mr. Yarrell's, published in the *Zoological Journal*, whitebait were thought to be either the young of the shad (*Clupea alausa*) or of the carp or bleak. Yarrell insisted that whitebait were the young of the herring. After a careful examination of the fin rays of the specimens given us by Mr. Blackford, we find these rays to correspond exactly with those given by Yarrell, as belonging to the whitebait, D., 17; P., 15; V., 7; A., 15; tail, 20. In all other descriptions the fish follow closely the English whitebait, save that the tongue had grayish tints on the edges. Prof. Spencer F. Baird is also an authority for the statement that whitebait are found on our coast, and are the young of the herring. We believe too, that whitebait are merely nothing more than young herring, perhaps of the alewife, and not a special fish with characteristics of their own. We notice that quite lately a discussion has been held in England on the subject of whitebait, as to whether they were herring or not. Some of the whitebait having been placed in an aquarium, the little fish grew to be good sized herring. We suppose that this crucial experiment can be made with us, and the Broadway Aquarium might get some whitebait and let them grow. All scientific speculation being, however, put aside for the moment, we are only too glad to believe that some of these fine days at Delmonico's, Sutherland's or Cable's dish of crisp whitebait, with the necessary concomitants, will be furnished to epicures.

MOVEMENTS OF THE FISHING FLEET.—The market for fresh halibut has proved very dull the past week, although the receipts have not been large for the season, only five arrivals being reported, bringing 240,000 lbs. The number of

Georges arrivals reported has been nineteen, but the average catch for the season is very small, and the receipts have not exceeded 375,000 lbs. Whole number of fishing arrivals for the week, 24.—*Cape Ann Advertiser*, April 12.

CONNECTICUT—*New London*, April 15.—Trout season opened with a perfect day, and the brooks have yielded well, and repaid one's efforts. The fish bit well, and large catches and heavy fish promise much sport. F. L. A.

NEW YORK—*Menhaden Lake*, April 15.—The trout are biting freely. Seem just as anxious to get from the water to the frying-pan as ever. A. R. FULLER.

—The Saranacs were clear of ice on the 12th of April.

PENNSYLVANIA—*Milford, Pike Co.*, April 6.—Trout fishing good this season. Amos J. Cummings and party, who stopped at F. E. Garrison's farm on the Sawkill, took 80 pounds of fish on the 1st, 2d, 3d and 4th instant, the average was seven to the pound, and the fish were game, in good condition and of exquisite flavor; ninety percent. of them are taken with a fly on Hamilton's, Perez's, Comte's, Garrison's and Pinney's preserves, which average three-quarters of a mile, the fee being from 25 cents to \$1 per rod per day. Anglers should stop at Le Clerc's hotel or Fanny Diminick's hotel, Milford, or at Garrison's farmhouse. At the latter place excellent board and first-class accommodations at \$1 a day. The Sawkill is now strictly preserved, and the vagabond poaching element is routed. Boarders at Shano's farm, at Loveaux's on the Raymondskill, are entitled to first-class fishing, the catches averaging five to the pound. Here board is from \$9 to \$12 per week, but the table is equal to Delmonico's. At Nyce's homestead at Tom's Creek, thirteen miles from Milford, is some rare fishing as strictly preserved as in Great Britain. The large trout in the Shohola will be anxious for the fly by May 1st. First-class accommodations at Moss Westbrook's hotel, Blooming Grove, from whence the preserves of the Blooming Grove Park Association are easily accessible. Flies for Pike county: Grizzly King, coachman, Pritchard's Van Patten, silver gnat, March brown and cow dung. The best bait is a coachman stretcher and grizzly king and Van Patten droppers. S.

TENNESSEE—*Columbia*, April 6.—Fishing excitement at its height. Large "creels" taken, and every one happy. Mr. L. P. still heads the score with a four and a half pound trout. Was shown some speckled trout taken from Buffalo Creek, the first caught in our streams, and their coming is heralded with gladness, as it gives a chance to compete with our Northern brothers of the rod in casting the fly, an accomplishment we have been anxious to attain. VAL.

KENTUCKY—*Stamford*, April 10.—A bushwacker speared a pike in Castle, a few days since, which weighed twenty-eight pounds. B.

A TRIP TO BUFFALO CREEK.—On the morning of March 25, Mr. T. and myself left Columbia, with horse and huggy, for a week's fishing in Buffalo Creek, Lawrence County, thirty miles west of Columbia. The road, a smooth pike, lay through the garden spot of Tennessee, as that portion of Maury County is called. Fine old mansions, situated in large parks of twenty and forty acres of oaks, beeches, maples, etc., built during the "flush times" of the South, with their large white pillars, broad stone steps and spacious halls, which bring to mind the hospitable planters and good old times of the days gone by, when the young people would gather for a gallop after the hounds or a canter through the fields. Alas! those are by-gones which one cannot think of without a sigh. Two miles west of Columbia we passed Gen. Gideon Pillow's large plantation, with a large brick mansion, built in "ye olden time," in the centre of a large park; a few of the negro cabins are still standing. Four miles further we came to Ashwood, the homestead of the Polks, the nobility of Tennessee. Here is also found the property of Countess De Chavette, nee Miss Antoinette Polk. Six miles further we come to Mount Pleasant, a neat little town on Little Bigbee, which abounds in trout and bass fishing. Twelve miles further brings us to Summertown. A driving colony of Northern men have settled here for the purpose of stock raising and fruit growing. Here we met Mr. F. H. Watkins, a subscriber and occasional correspondent to *F. AND S.* Mr. W. has bought a large tract of land, and intends to make a fish pond and hatchery on it, as a crystal stream of freestone water flows within fifty yards of his house. Mr. W. is a thorough sportsman, and in the evening gave us a treat in the shape of a run with the hounds after hares. Bunny was too cunning and holed. We then repaired to the house and partook of an excellent supper, consisting of fish (trout and pike), venison, etc. We spent the night with Mr. W. Daylight found us on our way to Buffalo, six miles distant. We reached the stream by sunrise, and all our dreams of Buffalo were verified. Buffalo Creek is a stream of clear, cold freestone water, about fifty yards wide, current swift and strong, with rocky bed and banks, with pools, out of which are caught trout, bass, pike, jacks, perch, etc. We did not have time to take many notes, as our lines demanded our attention, for our minnows had scarcely disappeared before they were struck and carried down stream with a vim. Their headlong career was soon checked, and our fish landed; one was a pike weighing about three pounds, the other a trout of about two pounds weight. This sport continued about an hour, when we had landed some ten or twelve fine fellows; it then began to rain and thunder and lightning, and continued the balance of the week, our "off time," and we had to return to our business without making another cast. We were very much pleased with the trip, notwithstanding our luck. We return thanks to Mr. Garner and others for courtesies extended. In conclusion, I would say that any one wishing to have a week's sport and roughing it, can find it on Buffalo Creek; snipe, quail, hares, and occasionally a deer, are found in the vicinity. VAL.

Columbia, Tenn., March 30.

CALIFORNIA—*Placerville*, April 6.—Have been on a fishing excursion up in the Sierras, along the American River. The first day I caught forty-three beautiful trout, some weighing a pound and a half and two pounds. Strawberry Valley is a very good fishing place. The woods all along the route abound in game, of which we got a very good supply. There are also lots of fish in the ditch of the El Dorado Water and Gravel Mining Company, a great many of which get into the hydraulic pipes of the company and get dashed against the rocks. At Smith's Flat there is being built a reservoir for the preservation of fishes. S. L.

THE SALMON RIVERS OF CANADA.—Anglers will please refer to the list of salmon rivers for lease by the Canadian Government, as advertised in our columns by Fish Commissioner Whitchee, of Ottawa.

THE NORRIS FLY RODS.—Those who wish to purchase some memento of the lamented Thaddeus Norris, Esq., can obtain one of his beautiful rods by addressing his son, Richard Norris, 2,550 Gray's Ferry Road, Philadelphia. See advertisement in our columns.

LINEEN FISHING LINES.—*Chicago*, April 9.—Dear Editor: Noticing the letter of G. C. in last week's *FOREST AND STREAM* on "Instructions in Bass Fishing," is it not the prevailing opinion that bass are somewhat shy, and that a white line will scare them? How then can G. C. recommend a twisted or cable-laid linen line? I have always found linen lines to wash white in fishing. Let us have more of such letters from other fishermen, for in the multitude of counselors there is wisdom. NORMAN.

[Linen lines can be readily dyed of a permanent color.—ED.]

AN IMPROVED REEL-SEAT.—Dr. J. T. Bohon, of Stanford, Ky., has called our attention to an improved reel-seat, invented in Central Kentucky, and in use by many of the anglers there. It is a simple bed-plate of sheet brass or silver to screw down upon the butt of the fishing rod, with a pair of clamps into which the reel-plate slides. It is much more convenient and secure than the rings used to hold the reel on.

CAUGHT ON A FLY.—Our old friend, Will Clarke, of Harrisburg, a short time since, handsomely perpetrated a little feat, which is as novel as it was amusing to his companion. Angling for bachelor perch with long rod and line without a reel, he threw an unfortunate high above the water, fully twenty feet distant, and discovered that the hook had been torn from its mouth, but not before a momentum had been given to the fish which would hurl it ashore, so he hastily set his rod against a convenient tree, and gracefully caught the game in his hands, observing to his friend, "That's one on the fly." Will is the life of every fishing party that can boast of his connection, and is as handy to have about camp as were Mrs. Toodles' varied purchases about the house. He wields his reel rod as elegantly as an accomplished swell twirls his rattan, and handles a whale with an ease, a nonchalance and success which are exasperating to all of us would-be's, and we know that he is not a slatherer (our localism for a greeny), but just how he chanced to impart such an impetus to the flight of that fingerling is more than even his boon friend and eye-witness to above achievement, "Tige," can explain. Stanford, Ky., March 20. KENTUCKIAN.

"THE GROUND HOG CASE ANGLER."

MIDDLETOWN, CONN., April 5, 1878.

Mr. Editor—I notice in your issue of 4th inst., an inquiry as to the definition of the phrase, "A ground hog case angler."

One day, about twenty-five years ago, so runs the tradition, in the palmy time when "circuit-preaching" flourished in the zenith of its glory, a Methodist divine of one of the backwoods circuits announced, by *avant courier*, that upon the next day—Sunday—he would expound the Scripture to the faithful at a little settlement in one of the Western States. (Having heard the identical story in seven different States, and each claiming the exact and original locality of the scene to have been within its limits, I refrain from specifying any particular one, for fear of giving offense to the others.) At the same time, a certain member of the congregation at this "clearing" was notified that he was expected by "his reverence" to furnish bed and board for the minister and his horse, as was customary on such occasions, during his brief sojourn in the settlement.

It happened, unfortunately, that the backwoodsman's larder, like "Mother Hubbard's" cupboard, was absolutely bare of any kind of meat; and the man was at his wit's end to devise some means of supplying this deficiency, especially as the minister was momentarily expected to "heave in sight." There was no time to hunt up a deer. At length, a happy thought flashed across his perplexed brain, and calling up his son and heir, a youth of twelve, he hurriedly explained his desperate state of affairs, and dispatched young hopeful with the injunction to catch a ground hog, the patting warbling ringing in the boy's ears: "You better not come home without one."

Meanwhile, the worthy man of God was nearing his destination, doubtless regaling his mind with visions of "chicken dinners," etc., which awaited his coming; when, chancing to look up from the bridle-path in which he was riding, he espied a small boy, spade in hand, frantically digging in the earth, as if for life or death.

"What are you digging for, sonny?" he patronizingly inquired, accompanying the interrogatory with that benign smile, of which only the circuit preacher is capable.

Without suspending his labors in the least to scrutinize his questioner the boy laconically replied, "A ground hog."

"Well, but what is the necessity of such a hurry? Can you not let the ground hog alone long enough to show me the way to Mr. —'s?" (the boy's father's.)

Judge of the holy man's consternation when the archbishop rejoined, "No, I can't, 'cause there's a durned preacher comin' to our house this evenin', and dad says it's a ground hog or no meat!"

As to the denouement of this story, history remains silent; but certain it is, that from this origin the expression "A ground hog case" has passed into circulation as a synonym of an *admirable resort*. Ergo, I presume that by a "ground hog case angler," "Val" meant to designate a "hard up pot-fisherman," if such a term exists. J. T.

[Two other correspondents have kindly helped us out on this case.—ED. F. AND S.]

Answers to Correspondents.

A number of anonymous correspondents will understand why their queries are not answered, when they read the lines at the head of this column.

PULL, Peoria.—Don't.

C. A. B., S. Norwalk, Conn.—Form, etc. sent you.

D. B. F., Frankfort, Ky.—Do not think it would suit you.

H. P., Somewhere (?), Wis.—The fire-arms company you wish the address of is in Norwich, Conn.

J. S. B., Pittston.—What would you use to kill ice on dogs? Ans. Rub in kerosene, or any stiff grease, thoroughly.

C. S. B., Lock Haven, Pa.—We do not know where to find the dog you want. We will, however, advertise some soon, we think.

G. W. C., Montreal.—Pope's "Upland Game Birds of the United States" is published by Scribner, Armstrong & Co., of this city. The 4th part (eight plates) is now out.

O. K., Boston.—Regret we cannot give you the information. An advertisement would bring you, we suppose, what you wanted.

W. O. W., Charlottesville, Va.—There are no rules for gallery practice. We send you, however, something which might help you.

LEM FRANK, Flemington, N. J.—For T. Todd Stoddard's books address Claxton, Remsen & Haffelinger, Philadelphia. Don't know the prices.

SUSSEX, Phila.—An excellent paint for bottle bottoms is finger-salt verdigris. Write to him at 163 South St., N. Y., for it. Price \$4.00 per gallon.

J. H. V., Newport, Ky.—What is the difference in price of chilled and soft shot as made by the Messrs. Talham? Ans. Soft shot, 7 1/2 c.; chilled, 10 cents.

T. H., Utica.—In describing the tin perforated by the Talhams' chilled shot will you mention more particularly the size? Ans. The brand of the tin was IN.

A. J. W., Brooklyn.—You will find the address of the secretary of the N. Y. Canoe Club in the columns of this issue under heading "The Oar and Paddle."

N. K. P., Westchester, Pa.—You will probably find in Oregon Co., Mo., bears, panthers, wild-cats, deer, turkeys, geese, ducks, swans and other wild low.

W. D. T.—Where can I get a picture of the land-locked salmon, either printed or lithographed? Ans. Send to Endicott & Co., Lithographers, 67 Nassau St., N. Y.

E. C. S., Harrisburg, Pa.—Where is the "V. Chr. Schilling" breech-loading gun made? Is it Belgium? Ans. The maker is not Belgian, the address is Suhl, Prussia.

ALLIGATOR PLANT, New York.—The wood you bought was what is known as the sweet gum tree, or *Sequidambar*. You are not the only one who has fallen into that alligator trap.

B. L. H., Hollidaysburg, Pa.—My setter scratches himself a great deal. Skin not broken, nor hair falling out. Ans. Use kerosene once a day to itchy spots, and give two or three doses of castor oil.

J. S. G., Elizabethtown, Mass.—Have a pointer pup one year old. He has red spots on his body which tick him. What is it? What shall I do for him? Ans. Rub in kerosene oil once or twice a day for a week.

F. O. B., Framingham, Mass.—In a *late Tribune* a writer, speaking of the game of Virginia, mentions "boomers." What are boomers? Ans. Common red squirrels are called boomers, or mountain boomers.

A CORRECTION.—In our last issue, in describing the St. Bernard dog, the printer mistook hair for hair. The hair of the St. Bernard, otherwisehound or bloodhound, is the redder portion of the inner eyelid of the dog.

E. T. P., Washington, D. C.—What species of salmon is found in the Susquehanna in the neighborhood of Harrisburg, Penn., and the method of capture with the rod? Ans. Black bass are called Susquehanna salmon.

JOHN, Newport.—Some three months ago I mashed my thumb nail. The old nail is shedding off, but the new nail is not half grown yet. How long will it take to grow out? Ans. The human nail grows about an inch in six months.

E. C. R., Boston.—Will you please give me information in the F. and S. on revolver-shooting of hand and target, penetration, length of barrel (32 and 38 shot and long)? Ans. Buy "How to Use the Pistol," Industrial Publication Co., 170 Broadway.

POMERAY, Iowa.—I failed to find an answer to my queries in the last issue regarding aquarium cement, gold fish, etc. Please answer in next. Ans. Would advise you to send direct to Fred Kaempfer, 127 Clark St., Chicago, who will furnish the complete outfit.

M. M. P., Boston.—1. What is the proper charge of powder for a 28-inch barrel, muzzle-loading rifle, throwing a ball of 45 to the pound? 2. Would Dittmar powder work well in it? Ans. 1. 65 grs. of powder. 2. Yes, providing your ball fits very closely. Try same bulk of Dittmar.

E. H., New Palz.—I have a red setter pup six months old that has two small lumps on each corner of his mouth and one on his tongue. They look very much like warts. What shall I do to remove them? Ans. Touch them a few times with nitrate of silver slightly moistened.

W. L. T., Bridgeport.—The balling of the shot you describe, we are certain does not arise from the chilled shot, but from some peculiarity of your gun. Sometimes there is a shoulder in the chamber, just beyond where the shell terminates, which has a tendency to make chilled shot ball.

JOHN.—There have been several books printed relating to the Florida war, but the best history is "Sprague's Florida War," printed, we believe, in 1842. We do not know where it can be had now, but you might inquire of Boughton, Wiley and other leading booksellers here, or in Boston.

D. R. G., New York.—What is the minimum and maximum age at which a dog should be broken, and is there any difference in this respect between a pointer and a setter? Ans. Any age may answer your query. Least time is from six months to one and a half years of age. No special difference.

WILD TURKEY, Brooksbury, Indiana.—Could not give you an opinion. Theoretically there may be something in it, but it is questionable whether practice would support theory. If you want a gun for turkey shooting use 10. The extra long barrels in no way improve the shooting. 80 to 90 inches is long enough.

J. A. D., Boston.—My Newfoundland dog kills pigeons and kills up downers. What shall I do? Have thrashed him. Ans. Can only advise a repetition of the whiplashing. He will understand it after a while. Try what has been recommended. Tie a pair of pigeons around his neck and he will get sick of them.

SECRETARY.—Will you give me address of some brother sportsman at, or near Asheville, N. C., and also near the duck hunting grounds of eastern N. C.? Ans. Theo. F. Davidson, Asheville and Charles N. Dudley, Pungo Ferry, Norfolk Co., Virginia; or Peter L. Talum, Bel Island, Currituck P. O., North Carolina.

VOYAGEUR, Goshen.—Would a person be charged duty on an English gun which had been used several years, and had passed through different custom houses abroad, and would duty be charged on its return to this country? Ans. If the owner of the gun brought it back, and made affidavit to that effect, no duty could be charged.

INQUIRER, Phila.—What reputation has the — breech-loading shot-gun? 2. What advantage, if any, does a 10 bore possess over a 12 bore? 3. It is no name at all, and in the trade is adopted to mean a third-class gun, or worse. 2. The advantage of carrying a heavier charge. Where large game is found a 10 is preferable to a 12.

T. E. O., New Haven, Conn.—1. My setter is five years old. His hair, though fine and silky, is of a dead color. Is in good spirits. What shall I do for his coat? 2. Have a three months' old puppy with a running

blue from his eyes. Ans. 1. The setter seems to need no treatment. Give him plenty of exercise. 2. Give the pup a little castor oil.

F. W. B., Green Bay, Wis.—I have a copy of your "Gazetteer" in which you mention "quitch" grass for your dogs. I have a fine young four month English setter and he seems to want something like it, as he eats grass occasionally. Would you tell me where I can get some seed? Ans. A full reply will be found in our kennel column this week.

S. G. V. G., Lancaster, O.—Inform me whether an old army Spencer repeating rifle would be reliable for deer? It shoots with most satisfactory accuracy at 150 yards; but is the force there, and will the gun answer the purpose above indicated? Ans. Would answer quite well. There is all the penetration necessary to kill an animal much larger than a deer.

E. O. M., Knox, Ind.—Which is the best dog for general hunting? I want a dog for cover shooting, retrieving ducks, and one which will hunt for rabbits and such. How would the cocker spaniel do? Is a chamber spaniel superior to the cocker, and where can they be procured? Ans. Cocker best for your purpose. We advertise some very good cockers.

F. S. G., Syracuse.—1. What part of New York is most interesting for visitors. 2. Who is the best shot of the world with a rifle? 3. Where can I get a good second-hand rifle cheap? Ans. 1. Consult Osmond's Guide Book to the Middle States. It contains full directions for "doing" the city. 2. He has requested us not to mention his name. 3. Consult our advertising columns.

G. H. B., Augusta, Me.—1. Please give me the proper charge for glass ball shooting for a 16 bore muzzle-loading gun? 2. The proper size of shot for above kind of shooting? 3. Where can I obtain Capt. Bogardus' rules for Trap Shooting? Ans. 1. 2 1/2 drs. powder, 1 oz. shot. 2. No. 8. 3. In Bogardus' "Field, Cover and Trap Shooting," price \$2. Can send you a copy.

I. L. C., Boston.—Give me name of any party this way from whom I could get the frame of a canoe. What preparation is to be made to paint the deck after the canoe is covered? Ans. We know of no one who makes the frame alone. See answer to J. K. O. Perhaps some of the canoe makers mentioned there would make frame. We advise a coat of boiled linseed oil and then thin coat of paint.

J. H. P., Augusta, Me.—Where can I obtain two short rifled barrels suitable to make into rifles for using the bullet caps? 2. Which are the best bullet caps, the American or the imported? 3. At what distance are they tolerably accurate? Ans. 1. Send to the Remingtons at Lilton, N. Y. 2. American bullet caps are better because of form of shell fitting better in guns and pistols. 3. About 75 feet.

C. G. J., Howell, Mich.—In glass ball shooting, Bogardus rules, ought the three traps to be placed on a parallel line in a position to throw the balls in the same direction, or in a semi-circle, and so placed that each trap throws the balls directly from the shooter? Ans. There is no provision in Bogardus' rules for position of the three traps, save that they shall be "ten yards apart, eighteen yards rise."

H. C., Worcester, Mass.—Please name the price of Vols. 1, 2 and 3, of FOREST AND STREAM. I have from 4 to 8 bound. I want the best map of Florida. Is there one that is reliable and minute enough to be of any practical benefit? Ans. Three volumes \$12—the first two very scarce and hard to get. Send to this office for Athrop's Map of Florida, price \$1.50—a most excellent and complete map.

TOR SHAP, Cazenovia, N. Y.—We have had a dispute and the answer in paper don't settle it. What is the extreme diameter that white holly grows to? Ans. If you mean *Ilex opaca*, or American holly, it grows from twenty to forty feet high, with a diameter of from nine to eighteen inches, and at any two feet from the ground level. Have never heard it called white holly. Perhaps you mean some other tree with a local name.

C. O. P., Boston, Mass.—I notice in your paper of Jan. 24, page 473, an account of a rattlesnake having been killed, measuring fifteen feet in length. Was that a misprint, or do they attain the length mentioned? 2. What is the reputation of — of London? Ans. 1. We have no reason to doubt the authenticity of the statement, though, of course, a rattlesnake of that size is a giant of his kind. 2. The makers rank among the very best in England.

H. H. V., Valparaiso, Ind.—Inform me of some way of saving our maple shade trees from borers? Ans. Killing the borer by means of a wire run up the hole gonging them out, or putting a piece of cauphor in the hole and plugging it up with a piece of soft wood are the means most in use for the extirpation of the apple and peach borer. We have had no experience with the borer on the maple. Perhaps Prof. Riley could enlighten you fully on the subject.

H. J. T., Boston.—Have a setter ten months old whose coat is somewhat curly. Is there any way that I can make it straight? The dog is one of a litter of five, has a clear pedigree back and is the only one of the litter that has anything wrong about their coats; in fact this litter have so far won three first prizes at bench shows, which shows that they must be pretty good dogs. Ans. Coat will probably come right in time; at least you cannot do anything to straighten it.

H. F. A., Colorado Springs.—Will you please tell me the best boat I can procure for a trip down the Arkansas and Mississippi Rivers to New Orleans? Wish one that will not weigh over seventy-five pounds. Also probable cost of same? Ans. Cannot conceive of a better boat than the paper canoe made by Waters & Sou, of Troy, 50 pounds, in which Mr. Bishop made his island voyage from Albany to Cedar Keys, Florida. Read his book, just out, and judge for yourself. Price of boat \$125.

P. H., Bloomsburg, N. J.—1. Where is the best place for trout fishing in the Big Bushkill of Pike Co? 2. Is this stream, or any part of it, within the limits of Bloomsburg Park? 3. Are sportsmen who are not members of this association allowed to fish or hunt within its boundaries? 4. Where and at what price can I get a wooden canoe for my fishing rod? Ans. 1. The upper Bushkill and its branches. 2. No part of it? 3. Not unless they are boarders at the Club House? 4. Nail four tapered laths together, step one end and hug a cover on the other.

H. O. T., Leland, Ill.—1. Is 375 No. 8 shot, a good pattern at 100 feet? 2. How many shots of a Denison pad ought a — breech-loader, 30 inch barrels, 9-16 lbs. weight, 10 gauge, Damascus steel, penetrate? 3. What is the proper load for such a gun, Hazard's powder and chilled shot for glass balls? 4. Also for ducks. 5. Would you mix Dittmar powder with Hazard's No. 4 Ducklog, or would you use Dittmar alone? Ans. 1. A fair pattern. 2. 25 to 30 shots. 3. 3 1/2 drs. powder, 1 1/2 oz. shot. 4. 4 drs. powder, 3 1/2 oz. shot. 5. Yes, half bulk of Dittmar.

CONSTANT READER.—I notice you say that Capt. Bogardus had shot 55,000 charges from his Scott gun. Does this mean 55,000 from each barrel, or 55,000 from both, that is 27,500 from each? Ans. The Scott gun has been shot by Capt. Bogardus over 55,000 times both barrels (not each), but both barrels fired the same shot, hence this one Scott top-snap action has stood this great wear of two sets of barrels, or in fact of two guns! We lately saw this interesting breech-loader at William Read & Sons, Boston, who furnished it to Capt. Bogardus, and the gun looked like a veteran of many battles, though in perfect order and as fit for use as ever. It is a great credit to Messrs. W. & C. Scott & Son and a proof of their strong action.

KIT, St. Louis.—1. Have a — breech-loading shot-gun, and should like to know your opinion of the maker? 2. Does taper choke give as good results as full choke in the way of penetration and pattern? 3. Can taper choke be changed to full choke without injury to the gun? The weight of the gun is nearly 10 lbs., 10 bore, laminated barrels, and a good weight of metal at the breech. Ans. 1. Though a good maker, not classed among the best; his work is, however, perfectly safe. Could not tell you more. 2. Do not think it does. 3. You might make the change with perfect safety.

ANATKUS, Derby.—1. Is the — rifle, 12 lb. barrels, considered an accurate gun up to 250 yds? 2. Are they allowed, and do they use them in the short-range matches? 3. Where can I get the general rules and regulations for off-hand shooting? 4. Which is considered the better rifle for long-range practice? 5. Are the — Gun Works a perfectly reliable firm? Ans. 1. It is not so considered. 2. Not at Creedmoor. 3. General rules of the N. R. A. would give you the information. 4. Respectfully decline answering. 5. Any order you would send them would be filled.

P. C., N. Y.—Do you consider the Laverack setter equal in endurance to the Irish? Do you believe their power of scent is superior to the Irish, and will there be any chance of procuring a pup at the N. Y. Dog Show, and what would you consider a fair price for a first-class pup? Ans. This is just one of those questions no fellow, dog-woman or otherwise, can answer. For energy and the scent the Irish are famed, for intelligence and good temper none find the Laverack. We should think you would have every opportunity of getting the pup you want at the coming leach show. Would cost from \$35 to \$50.

E. S., Albany.—1. Which is the safer flying pigeon, the English blunderbuck or a first-class American pigeon? 2. Were the pigeons which Capt. Bogardus shot at double, at the Brooklyn Driving Park a few weeks past, English blue-rocks or American pigeons? 3. Is there any person in this country who has the genuine English time-rock? 4. When John Taylor killed 91 pigeons out of 90 pairs, was it from ground or plunge traps? Ans. 1. The blunderbuck is decidedly the swifter. 2. American birds and very swift, as were Mr. Payne's a week or so ago. 3. Don't know of any. 4. Ground traps.

C. A., Minneapolis, Minn.—1. Will a — sporting rifle, 16 cal., 30 inch barrel, weighing 120 grs. powder and 300 grs. lead, shoot as strong, as far and as accurate as any of — long-range rifles? If not why not? 2. Will a 15 pound gun using such a cartridge shoot stronger and recoil less than a 12 pound? Ans. 1. 120 grs. of powder is a heavy load for such a rifle. It would shoot as strong, but not as accurately as the long-range rifles. Reasons would be difference in length of barrel, 30 inch barrel not burning all the powder and because the sporting rifle is not as perfectly balanced as the long-range (Creedmoor) rifles. 2. Not stronger shooting, but less recoil.

J. K. O., N. Y. City.—1. Is there a club devoted to canoeing? 2. Is there a journal devoted to this sport? 3. Who builds canoes after the approved Rob Roy model? Ans. 1. There is the New York Canoe Club, the Jersey River Canoe Club, the Newark Canoe Club and the Baltimore Canoe Club. 2. FOREST AND STREAM will, during the coming season, devote special attention to canoeing. 3. Everson, of Williamsburgh; Jarvis, of Watkins Glen and some other builders. The Rob Roy model is inferior for general use to the Nautilus, and especially to the Shadow. All builders build Nautilus canoes, and Everson makes a specialty of shadow.

D. F. E., Strasburg, Va.—Rowlocks should be placed about 7 1/2 ins. above level of thwart, exceeding the shell-board, where a long stretch to the legs is obtainable, when the height may be reduced to 5 inches. Position of rowlocks above of thwart is governed by their "spread." For 5 ft. spread they should be 1 1/2 ins. apart; for 4 ft. spread, to 1 ins. apart. A professional shell for John Ward was built with rowlocks 6 ins. above, and to 1 ins. apart. "Eagle" rowlock is really fast-rigged, unshipped, and can be used to carry the boat by. Write to Desmund, 87 Peck slip, N. Y., for them.

DOKE, Jersey City.—I have a blith pup; crossed setter and pointer; she takes altogether after the pointer; does not carry her tail straight. Will cropping the end remedy the fault? 2. Is the cross a good one? She is very intelligent and learns easily. 3. What is the reputation of — for getting up a serviceable gun as to shooting qualities? 4. How is Dupont's No. 2 duck powder in cleanliness and uniformity of strength? Ans. 1. It will not do any good. 2. Not a good cross. 3. We happen to know the exact gun you use, and a most excellent gun it is—no better; the maker, among the best. If the charge you use does your work, do not change. 4. Very good and uniform. Would be glad to see you at any time.

EDITOR, Irtavia, O.—A Scotch collie, just over the distemper, manifests strange movements in her action. In the evening she is in fair spirits, but is dull during the day. Seems to have no control over her hind quarters. Appetite variable, muzzle hot and dry. What shall I do for her? Ans. It is the partial paralysis so often a sequela of distemper through great loss of vitality. Recovery generally takes place, although there may always remain some slight evidence of impairment of muscular power. Quinine is probably the best remedy, with, perhaps, the addition of a small quantity of iron; or a pill containing two grains quinine and one-eighth grain iron, given three times a day for a couple of weeks.

D. G. E., Strasburg, Va.—How can I blast rock in a river with five or six inches of water flowing over it? Would dynamite do it, if so how is it fired and where can it be obtained? Ans. You would have to drill holes in the rock, a dozen or more according to the distribution, and introduce dynamite into the holes, the substance being placed in waterproof tubes. You would fire the dynamite by wires and a battery. See the method employed in 1873 by General Newton at Hell Gate. The dynamite may be obtained of J. R. Randall & Co., Wayne, N. J., and of the Atlantic Giant Powder Co., Drakeville, N. J.; the waterproof thickness of Messrs. Montebello, 207 Pearl St., N. Y. This latter firm furnished some 80,000 waterproof tubes for exploding Hell Gate.

R. B. P., Brooklyn.—The dimensions you give for a racing catboat are rather small. Do not think the limited size will give you much sport. For 12 ft. keel and 14 over all we would advise 5 ft. 6 in. to 5 ft. 8 in. beam, and 2 1/2 in. depth from top of rail or duck line to top of keel. Size of keel, 3 1/2 in. in width of centre-board, tapering to 2 1/2 in. at ends. Stem and stern post to correspond. Finer, 1 1/2 in.; plank, 1 in.; 1 1/2 in. boom, and 1 1/2 in. mast. Mast, 3 1/2 in. diam. in centre. Fasten with 1/4 in. copper nails, riveting heads. Deck over with 3/4 in. plank. Caulk all with cotton, and putty seams. Give two coats of Jageroll's ready mixed paint. Use clothes-line for halliards, or else 1/4 in. manilla.

W. W. C., Philadelphia.—1. What kind of a line would I use for an out line 100 yards long? 2. Kind of hooks for catfish and other fish that I would be likely to catch in the Schuylkill River? 3. What kind of bait are best for catfish? 4. Would a — rifle, 16 shots 1,000 yards range, be a good rifle to take West? 5. What part of the West do you think would be best for one to get land skins to ship East? Do you think that one could make a living at this business? Ans. 1. Buy a half cotton blueish line, or cod line. 2. Buy a Chestertown or Virginia hook large enough to admit your middle finger between the barb and the shank. 3. Raw meat is as good as anything. 4. Excellent. 5. Colorado. We know of a gentleman in that section who makes it a profitable business,

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INDOLENT IN MEN AND WOMEN OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

—AT—

No. 111 (old No. 103) FULTON STREET, NEW YORK.

[Post Office Box 2832.]

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Twenty-five per cent. off for Clubs of Two or more.

Advertising Rates.

Inside pages, nonpareil type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial columns, 60 cents per line.

Advertisements should be sent in by Saturday of each week, if possible.

All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

* Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, APRIL 18, 1878.

To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith and be addressed to the FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. No anonymous communications will be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of the mail service if money remitted to us is lost. NO PERSON WHATSOEVER is authorized to collect money for us unless he can show authentic credentials from one of the undersigned. We have no Philadelphia agent.

Trade supplied by American News Company.

CHARLES HALLOCK, Editor.

T. C. BARNES,
Business Manager.

S. H. TURRILL, Chicago,
Western Manager.

CALENDAR OF EVENTS FOR THE COMING WEEK.

Friday, April 19.—South Boston Yacht Club Regatta. Boston Bicycle Club Run to Squantum.

Saturday, April 20.—Convention of College Athletes at Fifth Avenue Hotel, New York. Boston Bicycle Club Run to Newton. Creedmoor: Remington Prize Competition, at 10:30 A. M.; Skirmisher's Badge Competition, at 3 P. M. Running Meeting at New Orleans. Base Ball: Springfield vs. Holyoke, at Holyoke; Hornell vs. Star, at Syracuse; Rochester vs. Lowell, at Lowell.

Sunday, April 21.—Running Meeting as above. Base Ball: Rochester vs. Manchester, at Manchester; New Bedford vs. Westboro', at Westboro'.

Tuesday, April 23.—Baltimore Kennel Club Bench Show. Portland Yacht Club Opening Cruise; Savannah Yacht Club Regatta. Running Meeting as above. Base Ball: Springfield vs. New Bedford, at Springfield.

Wednesday, April 24.—Manhattan Cricket Club, Prospect Park. Y. M. C. A. Athletic Tournament, at Boston. Baltimore Kennel Club Bench Show. Creedmoor: Waters Long Range Competition, at 1:30 P. M.; Wyle Badge Competition, at same hour; Competition for Remington Long Range Rifle, at same hour. Running Meeting as above.

Thursday, April 25.—Baltimore Kennel Club Bench Show. Running Meeting as above. Trotting at Toronto, Canada. Base Ball: Springfield vs. Rochester, at West Lynn.

WHEN KIT CARSON DIED.—One of our correspondents, "R. M. B.," is kind enough to inform us that Kit Carson died in 1868 and not "three years" ago, as our paper recently stated. (How the years do fly!) "He died at Fort Lyon, on the Arkansas River. His coffin was made at the fort by one of the soldiers and lined by the wife of the commanding officer, Mrs. Capt. Casey. The funeral services were conducted by the Rev. Dr. Sinton, now at Fort Keogh, Montana Ter. The above can be relied on, as I got it direct from Capt. Casey, now East on a furlough. He is also stationed at Fort Keogh, under Gen. Mills. He has command of Co. A, 6th Infantry."

THE ALLEGED CASE OF CRUELTY.

In a late issue of the FOREST AND STREAM AND ROD AND GUN we had occasion to dissent from the action of the Massachusetts Society for the Prevention of Cruelty to Animals, and to differ most widely from a decision of the Boston Municipal Court.

We have received from the President of the Massachusetts Society the following letter, published in the *Boston Transcript*, which we gladly print:

"THE SKINNER DOG CASE."

"To the Editor of the Transcript: Mr. Lucian Skinner, of this city, a gentleman, as I am informed, of wealth and high social standing, has twice, through your columns, attacked the Society for the Prevention of Cruelty to Animals for prosecuting him for cruelty.

"Will you kindly permit me to say that the complaint was first entered at Police Station No. 4, and an officer of that station was in court to enter a prosecution, but in the meantime the owner of the injured 'St. Bernard' dog had requested the society to act, and their complaint took precedence.

"The commencement of the difficulty between the dogs was not seen by Mr. Skinner. The testimony of the only witness that saw it was that the Skinner dog dropped a bone and snapped at the other dog first.

"Mr. Skinner, in defence of his dog, which was injured very little, beat the St. Bernard very severely with a cane, and then stabbed him with the largest blade of a four-bladed pocket-knife. The dogs then separated; Mr. Skinner's dog ran home, and the St. Bernard dog ran the other way.

"Mr. Skinner followed him a hundred and fifty to two hundred feet, kicked him several times, and then stabbed him again, as the evidence shows, twice, cutting a gash about three inches long. The case was tried in our Municipal Court by one of our most experienced judges. Mr. Skinner was defended by one of the ablest lawyers of the Suffolk bar, the society employing no counsel, and was fined forty dollars and costs.

"Mr. Skinner's son called upon our secretary, Mr. Firth, before the trial. He could see no reason why we should not abide the decision of the court. Messrs. Skinner, senior and junior, both called upon me subsequent to the trial, and after careful examination I could have no doubt the decision was correct.

"At Mr. Skinner's request, I brought the matter before our 'directors.' A committee of five, all widely known to the good people of this city, was appointed. They carefully investigated, and have, as I understand, unanimously reported that the society could not have refused to prosecute the case.

"The owner of the injured dog, as I am informed, has since sued Mr. Skinner for damages and recovered fifty dollars. It is alleged that the St. Bernard dog was a dangerous one, and that Mayor Prince once ordered him to be killed for an alleged attack upon a child. The evidence at the trial was overwhelming that the dog was not a dangerous one, and that in the case in question, when the facts were made known to the mayor, he revoked the order.

"The facts that Mr. Skinner first beat the dog severely with a cane, then stabbed him with a knife, then followed him a hundred and fifty feet, and kicked him several times, then stabbed him again, and that the dog, during all this time, made no attempt to retaliate, would, to dog owners, be pretty conclusive evidence, I think, of the dog's character.

"Mr. Skinner, as I have before remarked, is, I understand, a gentleman of age, wealth and high social position, and was doubtless laboring under intense excitement; but I cannot see how any of these circumstances would justify this society in refusing to prosecute. The letter of our secretary to the editor of the FOREST AND STREAM, referred to in Mr. Skinner's letter, was written in answer to a letter of inquiry from the editor, and its publication was not the act of our secretary.

"Geo. T. ANGELL, President of the Society."

To confute the arguments of the President of the Massachusetts Society, Mr. Skinner sent to the *Boston Transcript* a communication which the Boston paper declined publishing, though allowing its fairness. This communication states that there were two witnesses. We quote:

"Allow me to say there were two witnesses, namely, the small colored boy who was with the so-called St. Bernard, and a student of the Institute of Technology, a son of one of our prominent merchants, and both testifying at the two cases in court. The latter witness, a gentleman of unquestionable character, testified twice to the effect that there was no bone whatever; that the large dog came from behind him, and immediately attacked the other one, who was in front of witness, not twenty feet from him, walking quietly along next to the wall, and threw him down. The small dog then got away and ran off at full speed, followed by the other. Mr. Angell knew of this before the case was tried at all, as my son, in the presence of Mr. Williams, stated it to him, even to the name of the witness referred to above, and Mr. Angell remarked that he knew his father by reputation.

"Second: I utterly deny having kicked the dog even once, let alone several times.

"Third: Mr. Angell states that the 'St. Bernard' was ordered to be killed by order of Mayor Prince for an alleged attack upon a child, but when the facts were made known to him the order was revoked. The order was for the dog to be killed or removed from the city within twenty-four hours, and he was removed. Mr. Utz went to the father of the boy who was bitten, and got her permission to bring the dog back under the following conditions, i. e., that the dog should be kept under chain, and when on the street should go muzzled. Mr. Utz agreed to this, and engaged that the dog should do no further mischief, and, further, paid the doctor's bills and a sum of money to the parents. All of the above was testified to in court. At the time of the affair with my dog the 'St. Bernard,' so-called, was neither muzzled nor under chain, nor was he with any one responsible for his actions. Let the public compare Mr. Angell's assertions with the above, and judge for themselves. Your obedient servant,

Boston, April 13. "S. SKINNER."

We have received a large number of letters from prominent sportsmen and sympathizing friends who have known the defendant for thirty years as a gentleman merchant of probity and honorable position. We have not received one letter to question the action or the legal decision in the case. The verdict is, that any sportsman having a valuable dog to protect would have done precisely as the defendant did. The venerable years (seventy) of the gentleman assailed should shield him from from an imputation of impetuosity or bad blood. Aside from his uniform even temper and amiability, Mr.

Ethan Allen, of Pomfret, Coan., who raised Mr. Skinner's dog, comes forward to testify that he was a timid, harmless creature of 30 to 40 pounds in weight, and not at all likely to insult or make faces at the big St. Bernard, whose record shows that he is a dangerous dog who had been once condemned to death by the Mayor for injuring a lad. Mr. James H. Bowditch, also of Pomfret, unflinches that it was not the attacking dog, but the dog's master who was to blame in not having him under his control. He adds:

"Nevertheless, we maintain it was necessary to give the dog a quarter. A simple rebuff would have been entirely wasted; a vigorous onslaught was just what was needed to show the dog his duty then and in the future. Mr. Skinner most assuredly deserves the thanks of the public for his effort against canine lawlessness, and we already hear a general outside verdict of total acquittal."

From a careful reconsideration of the whole matter from the evidence before us, we are more convinced than ever of a very great injustice done Mr. Skinner. To make this sorry business even worse, the owner of a dog (lamb-like, according to the ideas of the Society for the Prevention of Cruelty to Animals, a dog, however, which from trustworthy evidence is in the habit of attacking children and dogs indiscriminately), the possessor of this gentle brute having brought a suit for damages against Mr. Skinner, this gentleman has been mulcted a second time. A very significant fact worth remembering is that Judge Churchill, a second Solomon, decided on the merits of both cases.

A perusal of the communications addressed us explains the whole unfortunate business much more clearly than would ten pages of commentary on our part.

We must decline opening our columns further for the discussion of this case, believing that it would rather tend to the discredit of the Massachusetts Society for the Prevention of Cruelty to Animals, and at the same time be a reproach to current Boston justice.

THERAPEUTIC VALUE OF FIELD SPORTS.

UNDER this caption the April number of the *Louisville Medical News* presents the subject of out-of-door pastimes and recreation to the medical fraternity in a new light. It urges upon the profession the regular employment and prescription of exercise and kindred hygienic remedies as a part of their pharmacopoeia. It urges the doctors to deal less in physic and more in natural forces. It presses upon them the importance of using and stimulating those vital forces which nature has implanted in man, and which, if properly treated, will enable the invalid to recuperate and become whole. The remedies most frequently prescribed by the Saviour in curing the sick in his day were exercise and bathing. "Go to such a place and wash seven times!" The places were remote, and much muscular energy was necessary to reach them. But hope and confidence inspired cheerfulness and perseverance. Persistent effort set the blood in circulation, and the vital machinery to work; it opened the pores, threw out the poisonous secretions, and placed the patient in the best possible condition to render his bathing efficacious. Repeated ablutions made the cure complete. We do not remember that the Saviour or His disciples ever prescribed pills or physic.

We trust Dr. Cowling's appeal to the physicians will be heeded, and that the effects derived will presently manifest themselves all over the land. We shall hope to see every limp and disjointed invalid at the watering places become elastic tourists, full of vigor and enthusiasm and a desire to live. We shall wait for the spreading of the gospel of the Forest and Stream, according to the *Medical News* of Louisville, all over the land.

We believe we can, with fitting humility, take some measure of credit to ourselves for having inculcated (according to the original prospectus of our paper) a love of out-of-door recreation and sport in our true men and women; and also for having suggested to our learned contemporary the thoughts which he has placed under the caption which stands at the head of this column, and of his essay in the *Medical News*. Our reward of effort comes in the harvest gathered from the seed sown, and the following surely indicates a good crop.

We quote:

"One of the best periodicals published in this country is the FOREST AND STREAM, of New York, devoted to the chronicling of field sports, etc. It is a wonderfully well conducted paper, coming out once a week with its immense pages filled with material from the best of pens all over this country, sparklingly edited and finely illustrated. No one can read its life-like sketches and not have stirred within him the love for nature which lies at the bottom of every good man's heart. But it was not because it brought such delightful pictures of the forest and field and stream to us, who, cooped up in city life, had so little opportunity of experiencing the reality, that we have made this notice of it in our pages. It was because it reminded us to point out a valuable and neglected mode of cure, and to place the medical aspects of the interests which it advocates before our readers, that we have been led to notice it in these columns intended for professional eyes.

"The practitioners of rational medicine should take care not to narrow their armamentarium down to the exhibition of drugs. Our catholic dogma that whatever has cured may do so again recognizes many more forces than the dispensatory affords; and some of these, it must be confessed, are better handled by our heretic brethren than by ourselves. The hygiene of the water-cures and the imaginative element of the homeopathic method are not to be despised. One thing is certain, that there is no more powerful agent in the control and cure of disease than amusement. Of course one cannot laugh away a small-pox, or drive off a rheumatism by a few

well-directed jokes—such therapeutics would in fact be a little glibly in the premises—but in the hundred ills which are included under the names of dyspepsia—the out-of-sorts, the chronic don't-feel-wells—and even many organic troubles, which so harass the patient and puzzle the practitioner, yield oftentimes like a charm when once the mind is diverted from their continual contemplation. We are in the habit of prescribing travel for these affairs; but travel is an expensive thing which few can indulge in, and does not always amuse, but rather substitutes one labor for another. When Newport and Niagara have failed, and your alternatives get no results, and you are puzzling yourself sometimes what you will do next, try the prescription of R., Go a-fishing; or, Sig., A hunt daily for a week or two, and see if you know your man when he gets back. They are the most rational medicines that one can take. In them psychological and physiological forces combine to lift the life-machine from the ruts into which it may have fallen. You say that malaria lurks in the fields?—corduroy is a better protective than quinine; that wet footing on colds?—never, when dried by a camp-fire. You say that your patient has no fancy for this sort of thing? We have yet to meet one who does not like it when he has tried it. It is a part of our original nature to love it. In every one there rises at times a desire to break away from the trammels of civilization and go wild. The baby, just able to toddle, pitches its tent in the nursery, with a chair for the ridge-pole, and mother's shawl for the canvas. The older urchin cooks his dirty dough by the fire built in the back yard, and dreams of adventure. The desire is just as instinctive as love, or hope, or any other passion in the human breast; and he is the wisest doctor who recognizes the voice of nature, not only when disease is at hand, but in the warnings it gives of its approach. Talk about prophylactics and hygiene—a man may live longer and better with a week's camping on the Kankakee or Green River twice a year, than by following all other directions that the sanitary wisdom of the State can devise. It is not the time only which is actually spent in these delightful wilds which renovates him, but the memory of that which is gone by and the contemplation of that which is to come renew his life day by day. Nor is it the number of fish on his string or the birds in his bag that measures the restoration of his wasted energies. A glorious nibble may stir the nerve currents to the brachial plexus for months to come, and a winged partridge excite hopes that may never die. The fact is—as the man of elegant diction said when he put the pepper and salt and vinegar on the oysters he was eating—it is the "condignments" which make up the pleasure of the affair. It is the invigorating atmosphere of the country, the rustle of the trees, the waving of the green fields, the hubble of the waters. It is the fiz of the frying-pan, the aroma of the middling. These are some of the factors of delight; but above all is the sense of security against the world, the consciousness of the merchant that the mails cannot reach him with the intelligences of hills payable, and to the doctor that the work of life and death is for a while in other hands—and the therapy of this placid feeling has no equal in the pharmacy of the world.

"Try it, brother, not only on your patient, but on yourself. Take the holiday in the glorious spring-time, which is now on us, that you have so well earned; go a-fishing or a-shooting; stay as long as you please, and be assured that not a moment is lost by your doing so. You will come back twice as strong and contented as when you went, and far able to give health to those who look to you for it.

"And, if perchance, you know of slashes where the zig-zag snipe do preternaturally congregate, or streams where the gamey bass or the solemn goggle-eye longingly waits for the lively steel-back, send word to your friends in the *News*. Our fields are shot to death; the fish of our creeks swim only in story; and we have at least convinced ourselves that April must find us by flood or in field."

A DELIGHTFUL SUMMER RESORT FOR ANGLERS AND VACATION TOURISTS.—We call especial attention for the first time to one of the most delightful regions in the world, and whose varied attractions have formed material for lavish embellishment in "Appleton's Picturesque America." We refer to the Blue Ridge country of Virginia. By the recent opening of the Chesapeake and Ohio Railroad, easy access is had to a panorama of romantic scenery, extending over 800 miles of railroad, and including the Natural Bridge, Weyer's Cave, Peaks of Otter and the Springs of Virginia, thirty years ago the most fashionable resorts in the country. There is every convenience and luxury for the invalid and tourist, either in cottage or hotel, some of the establishments having cost over a million of dollars each. There are plenty of speckled trout, bass, pike and pickerel in the mountain streams and lakes, besides bears, deer, turkeys, ducks, grouse, quail, snipe, woodcock, etc., in season. See advertisements of the Chesapeake and Ohio railroad in another column.

YACHTING.—Hereafter our yachting columns will be edited by Mr. Chas. P. Kunhardt, late of the U. S. Navy and a graduate of the Naval Academy, Annapolis, Md. Having made a specialty of naval architecture and yachting in all its branches, the yachting department of this paper will be maintained at a professional standard.

"PASSION," NOT "PROFESSION."—In the leading sketch of our last issue (April 11th), the types made the author state that "angling was his profession," whereas he intended to say, and did so write, that it was his "passion." Being a most modest gentleman, he repudiates any self-assumption whatever, and looks with evil eye upon the typo who put false words into his mouth.

—Commissioner Raum would do well to study the fine article by Chas. Hallowell, recently published in the New York *Herald*, entitled "Still Hunting in the Blue Ridge." It is a fine expose of the operations of the illicit distillers, with valuable suggestions upon the manner of suppressing that element of outlaws. The writer went through the whole district with the United States revenue officers, and is practically posted on his subject. For the rest, as the editor of the *FOREST AND STREAM*, he needs no recommendation as an authority on whatever he professes to know anything about.—*Don Piatt's Washington Sunday Capitol.*

GAME PROTECTION.

MEETINGS OF STATE ASSOCIATIONS FOR 1878.

New Hampshire State Sportsmen's League, Manchester, April.
New York State Association for the Protection of Fish and Game, Buffalo, May—; Secy., John B. Sage, Buffalo.
Connecticut State Sportsmen's Association, Hartford, May 15.
Iowa State Sportsmen's Association, Des Moines, May 28.
Nebraska State Sportsmen's Association, Fremont, May 21st and 22d.
National Sportsmen's Association, Wilkesbarre, Pa., June 11.
Illinois State Sportsmen's Association, Quincy, June 11; Secy., Geo. E. Wheeler.
The Pennsylvania State Association for the Protection of Game and Fish, Wilkesbarre, June 11; Secy., Benj. F. Downace.
Ohio State Sportsmen's Association, Cincinnati, June 15; Secy., Wiltbank, Toledo.
Tennessee State Sportsmen's Association, Nashville, Dec. 2; Secy., Clark Pritchett, Nashville, Tenn.
Wisconsin State Sportsmen's Association.
Massachusetts State Sportsmen's Association, at call of President of Missouri State Sportsmen's Association.

THE NEW MAINE LAW.—The game of this State, as well as the insectivorous birds, have in the past been wantonly and mercilessly destroyed by men and boys—our own citizens—and predatory bands from other localities and States, until the former are really nearly extinct, and the latter so decimated that our fruit trees and vegetation generally are being nearly ruined by the swarms of grubs, worms, caterpillars, etc. The attention of our Legislature has been called to this matter of late, and a law passed which we hope will put a salutary check to the business, and we are glad also to know that a lively interest is being awakened among the better class of our citizens to see that the laws are enforced. Deer and cariboo must not be killed in Maine between the first day of January and the first day of October, under a penalty of \$40.

Bath, Me., April 9, 1878.

G. E. N.

NEW HAMPSHIRE GAME AND FISH LEAGUE.—The annual meeting of this League was held at Manchester, April 2, with President John B. Clarke in the chair. A large attendance of delegates from the different parts of the State attested the growing interest in game and fish protection. The address of the occasion was an elaborately prepared paper by the Hon. J. W. Patterson, reviewing the progress of fish culture and the importance and magnitude of that industry. The officers of the League for the ensuing year are: John B. Clarke, Pres.; Charles L. Richardson, Sec.; Frederick Smyth, Treas.; Gillmen H. Tucker, Raymond; Daniel Burleigh, Wakefield; Levi W. Perkins, Wilton; George B. Brown; Ree. and Cor. Sec., Henry H. Kimball; Librarian, Curtis A. McGee; Executive Com., Weston Lewis, D. T. Curtis, James Walker, J. W. Smith, William S. Hills; Committee on Membership, E. Delano, C. T. Jenkins, L. Prouty. Capt. Charles Stanwood and Charles E. Pierce were elected honorary members.

—The Middlesex County (Conn.) Game and Fish Association have secured their first conviction of a law breaker.

MASSACHUSETTS FISH AND GAME PROTECTIVE ASSOCIATION.—Officers for the coming year have been elected as follows: Pres., Dr. John P. Ordway; Vice-Pres., Hon. Thomas Talbot, Hon. Charles Levi Woodbury, Hon. Daniel Needham, C. Warren Gordon, William Emerson Baker, Henry W. Fuller, Luther Adams; Treas., George B. Brown; Rec. and Cor. Sec., Henry H. Kimball; Librarian, Curtis A. McGee; Executive Com., Weston Lewis, D. T. Curtis, James Walker, J. W. Smith, William S. Hills; Committee on Membership, E. Delano, C. T. Jenkins, L. Prouty. Capt. Charles Stanwood and Charles E. Pierce were elected honorary members.

WISCONSIN.—A game protective club has been formed at Tomah, Wis., with the following officers: Pres. J. D. Condit; 1st Vice-Pres., J. A. Wells; 2d Vice-Pres., O. A. Hunt; Sec., John A. Warren; Treas., Ira A. Hill; Cor. Sec., J. O. Warriner. A strict observance of the game laws is the object of the association.

The Rifle.

THE AUXILIARY RIFLE.

On Thursday, two weeks ago, a representative of the *FOREST AND STREAM* AND *ROD AND GUN*, paid a special visit to New Haven for the purpose of witnessing a series of experiments made with what is called the Auxiliary Rifle.

Any one who may have read over our Questions and Answers may have noticed the constant character of a number of queries which runs pretty much as follows: "I am going into (a State is designated where both birds and animals are found), shall I take a shot-gun or a rifle?" In some cases we have recommended a shot-gun and in others a rifle, but it is quite evident that it would be better if the sportsman could take with him both arms. The problem has been then to invent or devise some plan by which with one and the same arm a man could be prepared for all eventualities. We are quite certain that Shelton's auxiliary rifle harrel will answer exactly this double purpose. As is well known, there are certain plans already in use which do convert a shot-gun into a rifle. Still the accomplishment of this is neither rapid nor convenient. A rifle harrel the whole length of the fowling-piece has to be adjusted, which must be secured by means of nuts and screws. Between this method and a permanent arm made with one barrel as a shot-gun and the other as a rifle, there is really not much difference. The Shelton auxiliary rifle obviates all this trouble. In three seconds time, or just as quickly as a metallic shell can be chambered in a breech-loading fowling-piece, the auxiliary barrel can be brought into use. In fact just as a loaded shell can be carried in the harrel so can the rifle be made instantly effective. Of course in an invention of this character, its simplicity is its charm, and like the egg Columbus placed on end a good many wise people will say, "Why did we not think of that before?"

The auxiliary rifle consists then of a harrel some twenty inches long, formed at the breech like a shell so as to fit snugly in the chamber of a fowling-piece. There is an adjusta-

ble bearing at the muzzle of this barrel, so that it is in close contact with the barrel of the fowling-piece into which it is chambered. This barrel can be slipped in or taken out. That is all there is about it. Now as to its accuracy:

At the Cove, East Haven, some ten days ago the representative of this paper had the pleasure of meeting His Honor Mayor Shelton, the chief magistrate of New Haven; Judge Samuel Bronson, Colonel Bacon, of the 2d Connecticut regiment; Mr. J. F. Colvin, one of the leading shots of the New Haven Rifle Association; Mr. W. A. Peek, late of the U. S. Engineer Corps; Ahlman John Reynolds, Mr. W. W. Blunt, and the inventors of the auxiliary rifle, Messrs. Clark R. Shelton and Arthur C. Shelton.

Now, of these numerous gentlemen, some were riflemen, but the majority of them were not. A Creedmoor target was placed at 200 yards, and the shooting commenced with a light breech-loader No. 13, weighing 6½ pounds. Auxiliary barrels, of both .44 and .38 calibre were used, loaded on the ground with the Everlasting shell or with the ordinary Winchester cartridge. Mr. Colvin had brought a new hammerless Sharps. Some seventy-five shots were made with the auxiliary barrel, and with exceeding accuracy. There were even a larger proportion of bull's-eyes made than is usual, as a large number of the experimentalists were novices in rifle-shooting. It was quite evident that the familiarity people in general seemed to have with the fowling-piece had helped them in rifle-shooting. They were rifleshots without knowing it. His Honor, the Mayor, made a bull's-eye at the first fire. Almost every one present made bull's-eyes. Of course, the action of the auxiliary barrel on the fowling-piece was noticed. The same gun, with the same auxiliary rifle harrel, had been fired many thousand times, and no effects were visible on the fowling-piece. After having fired quite a number of rounds, paper shells loaded with shot were used in the gun (the auxiliary harrel having been withdrawn), and excellent practice was made at flying objects, one discharge of the arm, with an ordinary shell charged with shot, removing entirely the slightest deposit of powder left by the firing of the auxiliary harrel at the muzzle of the piece. In fact, the interchange of rifle to shot-gun made no possible difference, the gun performing capitally both ways.

It seems manifest to us that, equipped with one of the Shelton auxiliary rifles, the sportsman can be fully armed. The length of the auxiliary rifle is only some twenty inches, and its weight seventeen ounces, allowing it to be carried in the pocket. It can be slipped conveniently into the arm-hole of the waistcoat and the breech portion passed down to the pantaloons pocket. An adjustable sight is made which can be placed on the gun, which sight can be laid flat when not in use. The ordinary head sight at the muzzle of the fowling-piece is not changed. As has often been repeated in our columns, shots at deer are rarely made at 200 yards, the distances being mostly very much under 100 yards. If, then, the accuracy of this fowling-piece with the auxiliary rifle was excellent at 200 yards, holding its own with a Sharps, it must certainly be very effective at 100 yards. There is no reason why, with a sufficiently heavy gun at the breech, that the Express system of a heavy charge and light ball could not be used. Somewhat chary of new things, and rather conservative than otherwise, we must, however, thoroughly endorse Messrs. Shelton's invention, believing, for practical usefulness, simplicity, accuracy and penetration, the Auxiliary Rifle must soon find its way into the hands of all sportsmen. We even think that, for range shooting at short distances, the Shelton Auxiliary Rifle may come into use. We should not be the least surprised (if it is within the Creedmoor rules) that some prizes could be won with it in matches this year. There would be something quite amusing in a man going to the front with a light Scott, Greener, Tolly, Wexley or Westly Richards, a Parker, a Fox, or a Nichols & Lefevre breech-loader, and making bull's-eyes at Creedmoor. In the United States and in England, where almost every one has a breech-loader, it is by no means impossible to imagine that a corps of men, suddenly called upon to defend their country, armed with such auxiliary pieces, would make most effective work with their shot-guns converted into rifles.

POINT BLANK.

V. M. INSTITUTE, Lexington, Va., March 25, 1878.

EDITOR *FOREST AND STREAM*:

I am under obligations to Major Merrill for his very complimentary mention of my letter to Mr. C. P. Stokes upon the fall of projectiles, which was published in your paper. Of course it was the English point blank I defined. The Major will find by reference to paragraph I, 200 of the "New Field Artillery Tactics for the U. S. A.," that the English definition has been authoritatively adopted in this country, and I presume it was adopted from the very consideration which has always led me to prefer it, viz: That it is simple, and gives a better idea of the power of a gun than the American or French definition of point blank range. There is this difference, however, between the Major and myself, that he calls the second intersection of the line of sight by the trajectory the point blank, making no distinction between the point blank proper, the natural point blank, and an artificial point blank. I think this distinction essential to clearness. In discussing the subject in "Thioux's Artillery" (French), and in "Roberts' Hand-Book of Artillery" (American), the natural point blank is defined to be the point of second intersection of the trajectory, with the natural line of sight prolonged, the line of metal, the intersection of the trajec-

CALIFORNIA.—San Rafael Rifle Club match, April 4; 200 yards, off-hand, Creedmoor rules:

Farrow.....	4	4	5	5	4	4	5	45
Pike.....	4	4	4	4	4	4	4	39
Ladd.....	3	4	5	5	5	4	4	42
Dubois.....	4	4	4	5	4	4	4	41

Berry.....	4	4	5	5	4	4	4	44
Watson.....	5	5	4	5	4	4	4	44

San Francisco, April 11.—The spring meeting of the California Rifle Association opened to-day. The weather was unfavorable, with a strong, gusty wind. The military team match, 200 yards, was contested by teams from First, Second and Third Regiments, National Guard, and was won by the First, by a score of 402 out of a possible 500. The Kellogg Challenge Cup, 600 yards, was won by Private Shaugnessy, of the Union Guard, by a score of 20 out of a possible 25. The Pacific Life Cup, 200 yards, was won by Brig.-General John M. McComb, by a score of 23 out of a possible 25.

MONTANA—Helena.—At a match held March 30 the following scores were made:

D. W. Curtis.....	3	4	3	4	4	4	4	25
H. Hewins.....	4	4	5	0	4	3	3	23
Major Bartlett.....	2	0	3	4	4	4	3	20

G. Stuart.....	3	2	4	4	4	4	4	25
W. J. Bickell.....	3	3	4	5	4	4	2	25

Major Page and O. Allen having tied on 26, fired three shots each to decide the winner. Score as follows:

Allen.....	4	4	3	11	Page.....	3	3	3	9
------------	---	---	---	----	-----------	---	---	---	---

THE BACK POSITION.—The question of the prone and back position in rifle shooting in England has gone through the usual round of discussion. In regard to the back position, a correspondent of the *Volunteer Service Gazette* shows (there being nothing new under the sun) that the back position was in use by the English Rifle Brigade seventy years ago. In the history of the Rifle Brigade, by Sir William Cope, in the description of a fight at Cacahelos, in Spain, during Sir John Moore's campaign in 1809, it is related that:

"It was at this moment that Thomas Plunkett, a private of the battalion, noted for his excellent shooting, crept out with the expression that he would 'bring that fellow down,' and, throwing himself on his back on the snow-covered ground, he caught the sling of his rifle over his foot, fired with deliberate aim, and shot General Colbert dead." His orderly trumpeter rode up to assist him, but Tom Plunkett had reloaded, and he also fell before his unerring rifle. He had just time to jump up, and, amid the cheers of his comrades, by running in upon one of the rear sections, to escape the sabres of a dozen of troopers who spurred after him in pursuit.

—Any one wishing a good field glass to use at a rifle range will please refer to advertisement this week.

Game Bag and Gun.

GAME IN SEASON IN APRIL.

Wild ducks, geese, brant, etc.

PATENTS ISSUED IN WEEK ENDING MARCH 5, 1875.—Fire arms, nipple guard, N. Fretz, 200,999; Cartridge, G. W. Evans, 200,993; Cartridge box, J. W. Frazier (7), 8,113; Cartridge loading device, E. Schenck, 200,946.

GAME IN MARKET.—RETAIL PRICES, POULTRY AND GAME.—Game—Red head ducks, per pair, \$1.50; brant geese, 75; mallard ducks, 75; black ducks, 75; widgeon ducks, 50; broad bill ducks, 50; teal ducks, 50; wild geese, per piece, \$1; Wilson snipe, per doz., \$1.50; plover, \$1.50; bay birds, large and small, 75 cents; wild pigeons, flights, \$1.25; do stall fed, \$2; Philadelphia squabs, \$3.00; wild do, \$2.

Poultry—Philadelphia and Bucks County dry picked chickens, per pound, 25 cents; do., fowls, 18; do., turkeys, 18; State and Western chickens, 15; do., turkeys, 15; do., fowls, 12; do., ducks, 15; capons, 50; slips, 40; spring chickens, per pair, \$1.50.

SPRING SHOOTING IN CANADA.

EDITOR FOREST AND STREAM:

MONTREAL, April 6, 1875.

There has been little spring shooting in this vicinity. The very apparent reason of the utter failure of the spring duck shooting was the sudden disappearance of the ice. Birds come, as you well know, with the first opening, and our chances are in decaying from the different points of ice nearest the channel. I managed to have one tolerably good day by being on the spot in the nick of time. I bagged twenty-three only, many more having dropped, which it was impossible to pick up on account of the swiftness of the current. Further west, however, the sport seems to have been more general. Their time for decaying extends over a much longer period, namely, almost a fortnight. Our esteemed friend and skilled marksman of the Limestone City, J. G. S., says:

"Duck shooting opened unusually early this spring, owing to the thinness of the ice. In the vicinity of Kingston Mills birds were not as plenty as they have been, but one or two of the local sports got some very respectable bags. Old Jock taking the lead, of course. In the drowned lands the ice went too evenly. We generally depend on its taking a week or ten days to get out of gun shot of the shore, thus confining the birds in their flight up and down the tide; but it went in a few days. Muskrats took advantage of this, though; so did we of them, and all through the moonlight till early morn, could be heard their death-knells.

"On the St. Lawrence, about the Thousand Islands, things were even worse, as was proved by some of our most wily sports returning with exceedingly few Golden eyes. Big Boy, or Wolfe Island, had its thousands upon thousands of blue bills; but, cut down, they remain in the middle some three-quarters of a mile from any point at which we could put our decoys, and the law forbids our 'snaken punts' and batteries. We could scare them up with heavy shot (occasionally dropping a bird or two which happen to miscalculate the exact range of our 32-inch. No. 10, which was perfectly new to them), but round and round they would fly, and presently, down they would come at the other end of the bay, till an extent of half a mile of water was actually covered by them.

Then up we had to go over two miles to get a couple more barrels off, but this was no fun, so we had soon to give it up. Reports say that in the vicinity of Sydenham and Collus Lake there were many more whistlers than usual, and that Mud Lake was well stocked, but Kingstons seem to have got out of the way of late years of going in that direction.

"Up the Bay of Quinte, particularly about Big Island, ducks were very numerous, the fishermen in that locality having had good sport after their fishing. Great pigeon news comes from the line of the Kingston and Pembroke R. R., but this is not new, for there were always plenty pigeons in that direction in the spring." ROYAL 11.

CANADA—Montreal, April 13.—Weather quite damp up here just now. Ducks are reported quite plenty in the river both above and below here. J. N. P. L.

MASSACHUSETTS—North Cohasset, April 8.—Coots, shell-drakes, geese and whistlers are now coming along in large flocks, and some good sport will be had this week by those who are tough enough to stand the exposure. Woodcock and snipe are coming, and have commenced to nest. S. K. Jr.

Salem, April 15.—A small shoot, ten birds each, Fast Day, between Messrs. Chase, Gardner and Morgan, resulting in eight, seven and five birds respectively. Several other shoots occurred, but they are "private." Scores "too good" to publish. Nothing but scattering snipe have been seen as yet, and generally wild. Some geese flying occasionally. Harbor bare of birds. R. L. N.

NEW YORK—Buffalo, April 6.—Pigeon shooting is good around Tionesta and Tideoute, Pa. Snipe are being shot around here. The woods are full of partridges, and the prospect for fine sport is good next Sept. En.

Kingston, April 12.—A large black bear was killed in Woodstock last Wednesday. Snipe are killed now on the Rondout Creek flats.

Good Ground, April 10.—There has been good goose gunning here this week. On Monday Lane with one man killed 17. On Tuesday with a party he bagged 33. Next week the flight of young geese is expected. The New Inlet continues fair.

Atlanticville, L. I., April 10.—Ducks and geese very plenty. Our party killed more than thirty geese yesterday. W. F. N.

Hornellsville, April 14.—Dear Sir: Wilson snipe and swallows arrived April 9th; not much of a flight of snipe yet, only about a dozen killed. A man at Dausville, while shooting plover, put the muzzle of his gun in the water. Result—an eye blown out. A crow blackbird shot here last week measured 13 inches from tip of bill to end of tail. Another specimen of rose-tinted grosbeak shot on the 10th. A magnificent specimen of the blue heron was shot at Olean the other day. Jous.

ADIRONDACK GAME.—Mr. A. R. Fuller, of Meacham Lake, writes to the *Albany Journal* that the mild weather of the past winter has done more for the game in the North Woods than all the enactments of the Legislature. A good season may be expected by Adirondack visitors.

In a letter just received by us Mr. Fuller says:

"Ducks and geese in great numbers going North. Nearly all of the spring birds have arrived. From the drumming out would think the woods full of partridges, and well they might. I never saw them so plenty in the spring. The open winter and great quantity of feed last fall has kept all kinds of game in good condition."

NEW JERSEY—Pine Brook.—Three Newark gunners made the unusual bag of 72 snipe at Pine Brook one day last week.

WEST SIDE GUN CLUB.—At the annual meeting of the West Side Gun Club, of this city, the following officers were elected for the ensuing year: Edward Schwyer, President; G. Boucsein, Vice-President; D. Stimpson, Treasurer; Francis J. Dugro, Secretary; J. Radley, V. Solnowski and Matthew Hettrick, Executive Committee. The club is in a flourishing condition, having fifty active members.

PENNSYLVANIA—Maple Lodge, Pike Co., Pa., April 12.—The streams here are pretty high and cold, and though muddy, are in excellent condition for fishing. One afternoon last week I took fifty-three fine trout from a branch of the Panpaek River near by. FRED W. JONES.

DELAWARE.—A correspondent reports good snipe shooting at Lewes, Dela. The snipe grounds are almost inexhaustible, and the walking good. Quail shooting in season. Reached via. Old Dominion Live steamers from New York direct, and from Philadelphia via. P. W. & B. R. R. Write to Wm. Tell, proprietor United States Hotel, Lewes, Delaware.

OHIO—Cincinnati, April 12.—We are having an early spring, and some snipe, but in small quantities as compared with some other States. R. E. DUARONE.

Pomeroy, April 9.—Snipe came about a week ago, and are getting tame and more plenty. Plover and yellow-legs are also beginning to arrive in fair numbers. ABE DACTON.

HOCKEY SHOOTING CLUB.—This is the name of a club recently formed at Lancaster, O., with the following officers: Dr. George W. Boerstler, Pres.; Chas. R. Richards, Vice-Pres.; S. G. V. Griswold, Sec.; George W. See, Treas.; Directors and Executive Committee, J. C. Tuthill, William Davidson, H. W. Carpenter.

ILLINOIS SPORTSMEN'S ASSOCIATION.—This society holds their fifth annual convention and tournament at Quincy, June 11, under the auspices of the Quincy Shooting Club. Among the list of prizes offered are the following: The Audubon Club, of Chicago, donates a gold medal valued at \$150; S. H. Turrell, a gold medal; Nichols & Lefever, of Syracuse, a breech-loading shot-gun, \$150; Parker Brothers, of West Meriden, Conn., a breech-loader, \$150; Russell & Hayden, Jacksonville, Illinois, a breech-loader, \$75; Jesse Sherwood, of Edina, Mo., a hunting dog, \$50; the Dupont Powder Co., a silver medal, \$50; the St. Louis Shot Tower Co., shot to the value of \$100; the St. Louis Shell Co., 4,000 conical base shells; the Union Cartridge Co., Bridgeport, Conn., 400 brass shells, 2,000 paper shells, 4,000 wads, and 2,000 primers. There are fourteen other prizes, ranging in value from \$35 to \$10. The meeting is to continue four days. The convention of the society to sit at the Quincy House on the evenings of Tuesday and Wednesday, the 11th and 12th. During the tournament an exhibition shoot will occur between W. B.

Hanworth and Capt. Stubbs, at 100 pigeons each, single rises, for the championship of the West. It is announced that Capt. Bogardus and E. T. Martin are barred from all shoots. ROYAL.

IOWA—Creston, April 7.—There are lots of prairie chickens here; see them by the hundreds every day; have shot a few when I could not help it; they set so close to the house it is hard to keep from getting hold of my gun and shooting them. There are lots of plover here, and some ducks. Have seen five prairie wolves since I settled here one month ago. N. D. M.

INDIANA—Brazil, April 6.—Snipe abundant. Yesterday two men brought in 81 jack snipe, and to-day two men got 87 snipe and five ducks. Snipe are plenter than ever known about here before. J. J. S.

NEBRASKA—Omaha, April 9.—Immense numbers of wild geese along the Platte River; all kinds of ducks in the marshes and ponds. Some good bags reported. As high as 56 head for an evening and morning shoot. *Scallapaw wilsonii* have arrived, and number snipe are thrown at them without regard to sex or condition. A bag of 39 was brought in yesterday. BOB WHITE.

THROUGH BOSTON—THE GUNS, THE RODS AND LINES.—Boston has the best peculiarities of an English city. In it may be found that highly cultured class of gentlemen sportsmen, who are capable of fully appreciating what is really good work, and who look critically at such guns, rods, reels, flies or lines as they may want to use. Such persons abhor shams, and hold in mortal horror that *scampering* which produces flashy, but unserviceable goods. What is wanted in Boston must be of the greatest excellence as to make and finish, nothing must be slighted. Gentlemen, then, who want good sporting goods of Boston make, are perfectly willing to pay a good price for such, fully aware that a conscientious workman must be fairly remunerated for his services. If foreign goods are wanted, the Bostonian wants the very best. Your Brunswick goods find no market in Boston. Now, there is that old established firm of Messrs. Wm. Read & Sons, 13 Faneuil Hall square, Boston. This is a house which has been over a half-century in the same business. Messrs. Read & Sons is the headquarters for the guns made by W. & C. Scott & Son, of England. As is well known, Bogardus uses these guns entirely. Shown by Mr. Read over all their extensive establishment, we saw all the many varieties of guns made by Scott & Son, from the premier gun to those of larger and cheaper grades. The Messrs. Read now sell for \$50 a top-snap action breech-loader; Scott, for \$50, with side action guns from \$30 to \$35. Here, too, were guns by all leading English makers, with a fine collection of double guns—one shot barrel with a rifle—an arm we are often asked about. The Messrs. Read & Sons keep the fullest possible stock of all loading implements and ammunition. Long established as are these gentlemen in their special branch of trade, they are known not alone in New England for their probity, but have a reputation which extends throughout the country.

At the Centennial the remarkably fine line of goods exhibited by Messrs. Bradford & Anthony, of Boston, claimed particular attention. For all kinds of angling implements, this firm has a merited reputation. Their catalogue comprises every variety of hook and line used for halibut off the Georges to the finest hook for fly tying. Their rods were the perfection of art. Rods can be had costing a few dollars up to those miracles of lightness, suppleness and strength worth some \$72. In flies, their collection was most varied. If the peculiar idiosyncrasies of the trout or the angler could not be satisfied with one hundred different varieties of flies shown us, well, Messrs. Bradford & Anthony would carry their fly-making, if necessary, even further. We never could have believed that so many varieties of reels could be produced. We have long been preaching that good reels (not running in rusty centres) ought to be furnished at reasonable prices. Here we found that at a small outlay a good, honest, serviceable metal reel could be had. Messrs. Bradford & Anthony showed us patent adjustable floats and sinkers, which were as novel as useful. You can put on or take off one of these floats or sinkers at will without knotting or tying the line, and once on it will stay until you want to remove it, which can be done in an instant. There is nothing in the sportsman's outfit for angling or camping that the Messrs. Bradford & Anthony do not keep.

At Messrs. Lincoln & Hopkinson's we found Gale's patent lawn and camp tent. Here was repeated over again what we have perhaps frequently heard before, that advertising in our columns does bring good results particularly into notice. Constant orders had come to Messrs. Lincoln & Hopkinson from the publicity given to the Gale tent in our columns. Briefly described, the Gale tent, weighing only 25 pounds, can be stored in a wagon or in a boat, and when opened on a kind of strong umbrella frame, is 8 feet high by 7 feet square, and will lodge quite comfortably some 4 to 6 persons. For croquet or cricket on the lawn, for the bath on the beach, or for the hunter, or general sportsman, we have yet to see a better, more compact or more readily adjustable tent.

Our remarks at the beginning of this article in regard to the care taken of leading Boston houses with their work has its fullest explanation when we examined the really fine guns made by Mr. W. R. Schaefer, of No. 61 Elm st., Boston. Mr. Schaefer is truly what he represents himself to be, a manufacturer of first-class guns. A certain number of guns we saw at Mr. Schaefer's shop in process of manufacture. There is no slighting done. Portions of guns which one never sees have as much conscientious good work put on them as have the outside. Every working part is finished to a hair. All that good judgment dictates as to choice of material to be used in a gun is followed up with patient skill. Now, what is the consequence of such good work? Why, exactly this: When Mr. Schaefer sells a gun of his make, say in Bangor, Maine, some one there on a visit from Portland, Oregon, orders another just like the one he has seen. Mr. Schaefer is now making guns for all parts of the United States, never without orders, and obtains good prices for good work. It is just one of those cases where a manufacturer setting out to build only the best guns for first-class customers, even in these dull times has a multiplicity of orders.

To draw a long visit in Boston to a close we must speak of the fine hunting suits made by G. W. Simmose & Co., Boston, of which Fowler & Fulton are the agents in New York. Here were shown all the varieties of sportsman's clothing, ranging in price from \$13 to \$60.

At the American Arms Co., No. 103 Milk st., whose motto is "a price to suit the times," we examined Fox's patent breech-loader, a style of gun which is rapidly gaining in public favor. Excellent breech-loaders, with twist barrels, can

(4) The concluding moves are played in Rrrr Steintz's most finished style.

National Pastimes.

SCOTTISH-AMERICAN CLUB.—The opening games of this club, last Saturday, resulted in the following scores:

One-mile Walk, open to all who have not performed in a public race, 14 entries—First heat—W. T. West, Col. City N. Y., 8m. 14s.; second heat, J. B. Adams, S. A. C., 8m. 36s.; third heat, J. H. Crotti, S. A. C., 8m. 43s.; final heat, West, 8m. 39s. Adams second.

Two hundred and Twenty Yards Run, 5 competitors—M. E. Moore, 27s.

Three-miles Walk, 3 entries—Chas. Conner, 24m. 26s.

One-half-mile Run, 3 entries—H. H. Moritz, 2m. 35s. A tug-of-war closed the games.

AMERICAN RACKETS.—The match games at the Racket Club Court, Sixth avenue, this city, began last Monday with games between Messrs. Adams and Allen. First game, Allen, 15, Adams, 8; second game, Allen, 15, Adams, 2; third game, Allen, 15, Adams, 8. A racket game at McQuade's Court, this city, last Saturday, resulted in a score of 21, 15 and 13 for W. Maloy, to 19, 21 and 21 for John Sherman.

LIGHTNING SPEED.—The Western Union Telegraph Company boys had a display of pluck and muscle at the West Side Driving Park, Jersey City, last Saturday. The winners in the various contests were: The one-mile walk, twelve entries, J. M. Foster, 1m. 40s. start; time of the mile, 9m. 12s. John Donohue, in the standing broad jump, 8ft. 1in. Standing hop, step and jump, Donohue, 25ft. 1in. D. B. Mitchell captured the 100 yards run in 11s. Donohue in the running hop, step and jump, 33ft. 10in.

ANOTHER LONG WALK.—Sir John Astley's latest proposition is a twelve days' walking tournament, starting Monday morning, resting over Sunday, and finishing on the succeeding Saturday night. First prize, \$1,000. Weston, O'Leary and Gale are expected to compete.

—The Y. M. C. A. Rowing Club, of Boston, give an athletic tournament at the Tabernacle, that city, April 24. There will be the usual athletic contests, with the exhibitions of feats on the gymnastic apparatus.

FIFTY MILES.—George Law, an ex-member of the Scottish-American A. C., made his debut in the character of a professional at the N. Y. A. C. grounds last Saturday. His work was 50 miles in 9h. 45m. 22s.

—In a one-mile running contest, four entries, at the N. Y. A. C. grounds, Saturday, for silver medals to first and second, the winners were T. H. Noonan, A. A. C., 5m. 29s., and W. S. Denmark, A. A. C.

—In a race between W. S. Harding, of this city, and Christopher Rice, of Rutland, Vt., at Rutland last week, the former won on a score of 50 miles in 8h. 55m. 18s.

—Chas. A. Harreman, of Haverhill, Mass., attempts, at Boston to-day, to beat O'Leary's best 100-miles time—18h. 53m. 40s.

HOW TO SWIM A HORSE.—These directions are imported; they came from the *Pastoral* (Australia) *Times*, and may be regarded with especial attention as coming from afar:

"It is astonishing how foolhardy most men are in venturing into deep water on horseback. Many a man has been years in the colony without having had occasion to attempt swimming a horse; but hearing it spoken of as a trifling matter, he fancies it comes as naturally for a horse to swim with a man on his back as to walk or gallop. On the contrary, not above two or three horses in a hundred can carry a man safely over a river or stream of any width, and very few men have the nerve, coolness, and presence of mind to leave a horse alone and let him swim. A horse with a man's weight on his back naturally sinks very deep in water, and many horses, before they attempt swimming, keep feeling for bottom with their hind legs. Unless a man is accustomed to swimming a horse, he gets nervous, begins pulling at the reins, and then it is all up with him. The horse gets frightened, struggles, rolls over on his side, or comes right over backwards, and probably gives his rider a kick that puts an end to all his chances of getting ashore. In my opinion no man should go into deep water of any width who cannot swim, and a swimmer should take off his clothes, put them in front of his saddle, unbuckle his reins, and then he is ready for any emergency. The neglect of this later precaution generally drowns the horse, as his foot gets caught in the bridle. I have, however, seen many a man who could not swim get safely across a river by driving his horse and catching hold of his tail."

—The goslin is the old goose's young child. They are yellow all over, and as soft as a ball of worsted. Their foot is wove hole, and they can swim as easy as a drop of kastor-oil on the water. They are born annually about the 15th of May, and never was known to die naturally. The goslin waddles when he walks and paddles when he swims, but he never dives, like a duck, out of sight in the water, but only changes ends.—*Josh Billings.*

THAT'S THE KIND OF A COYOTE HE IS.—The Virginia, Nev., sportsmen have invented a new and improved system of fox-hunting. The improvement on the old style is in the can't-catch-'em, self-returning, automatic self-boxing, warranted-not-to-wear-out coyote, which takes the place of the ordinary unsophisticated fox. The *Enterprise*, of that town, says:

"Last Sunday a number of our sportsmen took a coyote out into the Twenty-one-mile Desert, visible to the eastward from this city, for the purpose of having a chase—they having a pack of foxhounds with them. When let out of his box the coyote was allowed to get a start of about three miles before the hounds were turned loose. Hounds and hunters on horseback then started after the animal, which gave them quite a long chase. Finally, the coyote became tired of being hunted, and started back toward his box, which had been left standing on the desert, near the wagon in which it was brought. Hounds and men went after his wolfish pell-mell, but he gained the shelter of his box. He was allowed a rest, and was started off again. He made even a better run than before, but, finding himself hard pressed, again made for his box, which he finally reached, but not before he had fought several good fights with the dogs. As it was thought the coyote had done enough work for one day, he was allowed to remain in his box and was brought back to town. That coyote now considers that he knows all about the business, and in time will probably come to enjoy it."

WHAT HAPPENED.

A very respectable Kangaroo died week before last in Timbuctoo; A remarkable accident happened to him: He was hung head down from a banyan-leaf. The Royal Lion made proclamation For a day of fasting and lamentation, Which led to a curious demonstration: The elephant acted as if he were drunk—He stood on his head, he trod on his trunk; An over sensitive who Gorilla Declared that the shock would surely kill her; A frisky, gay and frolicsome Ape Tied up his tail with a yard of rope; The Donkey wiped his tears with his ears, The Crocodile shed a bucket of tears; The Rhinoceros gored a young Oiraffe Who had the very bad taste to laugh; The Hippopotamus puffed and blew, To show his respect for the Kangaroo; And a sad but indignant Chimpanzee Gnawed all the bark from the banyan-tree.

—*Hon. Foster, St. Nicholas for March.*

Tiffany & Co., Silversmiths, Jewellers, and Importers, have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they prepare special designs for similar purposes. Their **TIMING WATCHES** are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. **TIFFANY & CO.** are also the agents in America for Messrs. **PATEK, PHILIPPE & CO.**, of Geneva, of whose celebrated watches they have a full line. Their stock of Diamonds and other Precious Stones, General Jewelry, Artistic Bronzes and Pottery, Electro-Plate and Sterling Silverware for Household use, fine Stationery and Bric-a-brac, is the largest in the world, and the public are invited to visit their establishment without feeling the slightest obligation to purchase.

SPORTSMAN'S SCORE BOOK
FOR
GLASS-BALL TRAP SHOOTING

In the spring traps now used to throw glass balls for practice shooting, sportsmen have a mechanical contrivance which should entirely do away with the "chances" which arise in trap-shooting, as the glass ball goes straight in the direction desired by the trap puller, or in which the trap is set. In bird shooting from a trap—which many dislike on account of the wall known objection to it—there is a large element of chance, as one man may have good, slow quarrying birds, while his opponent may get strong "in-coming" or "tail-birds," making the match uneven, simply because the one has more birds than the other, and is not liable to miss or have his birds drop outside the boundaries. In order to derive the greatest possible benefit from trap shooting, and at the same time test the sureness of any number who may be engaged, it is necessary. First, that not only should the trap throw balls in different directions, but that each person shooting should have in every ten shots the same angles at which the other shoots, so that no one may be favored by chance or by the trapper. Second, that a record be kept of each person's hits and misses and the angles on which they occur, so that one may practice intelligently, knowing on what angle he needs more proficiency. It is believed that the plan adopted for recording, which has been copyrighted, together with all arrangements, whether of letters, or figures, characters or plans for recording shooting by angles, will be found all that is desired. (For good practice the trap should at all times be bid from view of the person shooting—by screen or otherwise.) This system not only records the angles at which each person compelling secure the same shots as all the others, but also records the angles on which he fails to hit his balls, so that he may practice close and perfect shooting where he fails most. We have carefully examined "The Sportsman's Score-Book for Glass Ball Trap Shooting," by D. K. HILKIN, and can confidently recommend it as being the most perfect system we have seen keeping a complete record of a shooting match, and affording the chance of those engaged, in regard to the direction in which the balls are thrown, by giving each person the same angles at which all the others shoot. The book is well printed on good quality paper, and contains full instructions to guide the user.

Guns, Etc.

GUNS Cheap.

Below will be found my last list of second-hand shot-guns for this season. But two of these have ever been advertised before:

GREENER—Treble-wooded fast; 10-bore, 50-in. barrels, \$2 1/2 lbs.; all improvements; will make average penetration of over 200 with No. 7 shot at 40 yards, 30-in. circle; cost, last October, \$250; price, \$165.

RIGBY—Highest quality; 12-bore, 7 lbs.; elegant Damascus barrels, in solid leather case; cost \$225; price, 275.

E. M. REILLY—This gun was made to order without engraving; 12-bore, 7 1/2 lbs. Damascus barrel; in good condition, in best English case, with complete set of finest implements; cost \$275; price, 175.

SCOTT—Slide lever, 10-bore, 9 1/2 lbs., fine laminated barrels; in good condition; cost, new, \$125 gold; price, 90.

S. OTT—Double grip, 8-bore, 34-in. barrels, 13 lbs. weight; no engraving; very fine; cost, new, \$160; used one month; price, 125.

SCOTT—Slide lever, 10-bore, 34-inch, 10 1/2 lbs. weight; nearly new; cost \$120; price, 70.

G. LAFLEY, Leicester, England—This gun, double grip action, 12-bore, 7 1/2 lbs. weight; elegant Damascus barrels, horse-shoe bridge, rebounding locks; in case with implements. This is one of the very finest guns, and cost originally \$275; made to order in best manner and as good as new; present price, with case and implements, 125.

TOLLEY—Double express rifle, .50-cal., 5 drms. powder, 9 lbs. weight; the very finest in every particular; new and complete; original cost, \$275 gold, 175.

DISSARD—Slide lever, laminated steel barrel, 12-bore, 7 1/2 lbs. weight; nearly new, in good leather case, for, 50.

WESTLEY RICHARDS—Muzzle-loader, 10-bore, 8 1/2 lbs. weight; in good condition; original cost, \$125; present price, 35.

A very fine German breech-loader, made at a cost of over \$300; elegant Damascus barrels and finest locks, at, 150.

Also another, cost \$125, for, 50.

These Guns are all sold at great sacrifice. Each gun is exactly as represented, and will be sent for examination on satisfactory reference or receipt of sufficient money to pay express charges.

HENRY C. SQUIRES,

1 Cortlandt St., New York.

CAMP'S LOADER STILL AHEAD

Each loader adapted to 10 and 12-gauge metal or paper shells of any length, each shell being accurately charged and wadded complete in one operation. Amount of charge readily adjusted. Highly endorsed by sportsmen and the press. Having perfected arrangements for manufacturing in large lots, we have reduced the price to \$6. Manufactured only by CAMP & WISE, Stoughton, Dane County, Wisconsin. All orders for sample loaders must contain remittance.

For Sale.

FIELD, COVER AND TRAP SHOOTING.

BY CAPT. BOGARDUS.

New and enlarged edition, containing instructions for glass ball shooting, and chapter on breeding and breaking of dogs by Miles Johnson. For sale at this office. Price \$2.

Wanted.

Decoy Ponds.

A gentleman will be happy to enter into correspondence with any party with the view of establishing Decoy Ponds for taking wild fowl in large quantities, having had great experience in England, where he was very successful. The thousands of wild ducks that resort to winter to some of the Southern States can be made a source of great wealth at very moderate expense. The price of wild fowl in both the English and American market will justify any one entering into the enterprise. Address E. C. D., New Glasgow, Nova Scotia. april 3t

WANTED.—One hundred fresh prairie chicken eggs; at least one-half warranted to hatch. Apply, stating price and particulars, to RAMON, this office. april 4t

\$30,000. A gentleman holding seventeen sections of the best grain land in Northwest-Minnesota, on the extension line of the St. Paul and Pacific R. R., wishes to find a capitalist with the above amount to join him in farming operations on an extensive scale. Sharp fall and ruffed grouse in abundance. Fine woodcock shooting on the Red River bottom; also ducks, geese, quail, pheasant, deer and hare. Full particulars, inducements and highest references may be obtained at this office on application to the Managing Editor. april 4t

WANTED.—Circulars and price lists of ice machines. J. HICKS, Mt. Royal, Fla. april 1t

Gunpowder.

THE HAZARD POWDER CO.

MANUFACTURERS OF

GUNPOWDER.

Hazard's "Electric Powder."

Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. only.

Hazard's "American Sporting."

Nos. 1 (fine) to 6 (coarse). In 1 lb. canisters and 6½ lb. kegs. A fine grain, quick and clean, for mid and prairie shooting. Well adapted to shot-guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 6 (coarse). In 1 and 5 lb. canisters and 6½ lb. kegs. Burns slowly and with great penetration. For field, forest or water shooting, it ranks any other brand, and it is equally serviceable for muzzle or breech-loaders.

Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting" FG. In kegs of 25, 12½ and 6½ lbs. and cans of 5 lbs. FFG is also packed in 1 and ½ lb. canisters. Burns strong and rapid. The FFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard Rifle powder of the country.

Superior Mining and Blasting Powder.

GOVERNMENT CANNON & MUSKET POWDER. ALSO, SPECIAL GRADES FOR EXPORT, OF ANY REQUIRED GRAIN OR PROOF, MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's Agents in every prominent city, or wholesale at our office.

89 WALL STREET, NEW YORK.

Lafin & Rand Powder Co.

No. 26 MURRAY ST., N. Y.

Sole Proprietors and Manufacturers of

Orange Lightning Powder.

Nos. 1 to 7, strongest and Cleanest made, in sealed 1 lb. canisters. Higher numbers specially are recommended for breech-loading guns.

Orange Ducking Powder,

For water-fowl, strong and clean. No. 1 to 5 in metal kegs, 6½ lbs. each, and canisters of 1 and 5 lbs. each.

Orange Rifle Powder.

The best for rifles and all ordinary purposes. Sizes, FG, FFG and FFGG, the last being the finest. Packed in wood and metal kegs of 25 lbs., 12½ lbs. and 6½ lbs., and in canisters of 1 lb. and ½ lb.

All of the above give high velocities and less residuum than any other brands made, and are recommended and used by Capt. A. H. BOGARDUS, the "Champion Wing Shot of the World."

BLASTING POWDER AND ELECTRICAL BLASTING APPARATUS. MILITARY POWDER of all kinds on hand and made to order. Safety Fuse, Frictional and Platinum Fuses.

Pamphlets, showing sizes of the grain by wood cut, sent free on application to the above address.

H. M. QUACKENBUSH, Patentee and Mfr., Herkimer, N. Y.

Hart's Sportsman's Favorite Metallic Shells. FOR BREECH-LOADING SHOT GUNS.

These Shells are easily loaded, and the caps easily extracted from inside. Head solid and much thicker than any Shell now made, giving a solid seat for cone or anvil, which prevents it from driving through or springing away, thereby causing miss-fires. The Cone is made of nickel, and fastened solid in its place. Neither rusts nor corrodes fast, like movable anvil made from steel. The Nickel Cone also prevents miss-fire when a cap has been left on shell for a few days, which is liable to occur either in steel or iron. These Shells are finely finished, and made any length ordered, from 2½ to 3½ inches. Shells and Loaders and Descriptive Price-Lists can be obtained from all the leading Sportsmen's Houses throughout the country.

FROM CAPTAIN BOGARDUS, CHAMPION WING-SHOT OF AMERICA.

MESSRS. GEORGE E. HART & Co.—Gentlemen: The fifty Shells I received from you to-day suit me better than any I have ever used. They are stronger and better in every respect, and I shall use them in all my shooting hereafter.

Yours truly,

A. H. BOGARDUS.

SHARPS' RIFLES---MODEL 1878.

NORRIS RODS

Parties wishing to procure one or more of the above make of Rods can do so by applying in person or by letter to

RICHARD NORRIS, 2,550 Gray's Ferry Road, Philadelphia

Comprising four Salmon Rods, two Trunk Rods (Front), thirty Trout Rods of Split Bamboo, Lance and Iron Wood and Greenheart, with extra tips of split bamboo and extra middle joints. Some of the above in Red Cedar cases; a convenient form of carrying them to prevent injury to the tips. Any information in regard to the above will be furnished on application to the above address April4 46

Auxiliary Rifle.

SHELTON'S Auxiliary Rifle Barrel for Breech-Loading Shot-Guns.

This barrel can be placed in a gun ready for use in a second of time with the same ease as a cartridge, and can be removed just as expeditiously. There is no wear on the rifle barrel, nor on the shot-gun, and it cannot get out of order. With this Auxiliary Barrel, which weighs about one pound, almost instantly a breech-loading shot gun can be converted into a muzzle-loading rifle. The AUXILIARY BARREL will fit any standard make of gun of 10 or 12-calibre—rifle of 32, 38, or 44, as desired. Length of barrel, twenty inches. Any central fire metallic cartridge can be used. Also, the EVERLASTING SHELL or shells can be loaded by the person using the rifle. Send for a Circular and Price List.

Musical Instruments.

HIGHEST HONORS

AT THE

Centennial World's Fair, 1876!

THE

SHONINGER ORGAN

PRONOUNCED UNANIMOUSLY AS THE

Best Instruments.

Their comparative excellence is recognized by the Judges in their Report, from which the following is an extract:

"The B. SHONINGER ORGAN CO.'S exhibit as the best Instruments at a price rendering them possible to a large class of purchasers, having a combination of Reeds and Bells, producing novel and pleasing effects, containing many desirable improvements, will stand longer in dry or damp climates, are liable to get out of order, all the boards being made three-ply, put together so it is impossible for them to either shrink, swell or split." THE ONLY ORGANS AWARDED THIS RANK.

There are 50,000 of our Instruments in this and the European countries in use, and they are so made that they will keep in tune, and stand any climate. They contain a magnificent Chime of Bells, tuned in perfect harmony with the Reeds, producing wonderful effects. The Music Rack, when tuned forward, will make a splendid writing desk, with our Book Cases and Swinging Lamp or Flower Brackets, with a fine stool boxed free with each Organ, makes the SHONINGER ORGANS the most substantial, convenient and perfect Organ.

ESTABLISHED 1850.

We are prepared to appoint a few new Agents.

"THE FISHING LINE."

Brook Trout, Grayling and Black Bass Fisheries of Northern Michigan,
VIA THE

Grand Rapids & Indiana R.R.

(Mackinaw, Grand Rapids & Cincinnati Short Line.)

Sportsmen who have cast a fly, or trolled a spoon in the

Grand Traverse Region

will come again with solicitation. All other lovers of the Rod are invited to try these waters, wherein the fish named above, as also Muscalonge, Pike and Pickerel abound.

In no other streams east of the Rocky Mountains is the famous **AMERICAN GADAYLING** found in such numbers.
BROOK TROUT Season opens May 1.
GRAYLING Season opens June 1.
The Sportsman can readily send trophies of his skill to his friends or "Cine" at home, as ice for packing fish can be had at many points.
TAKE YOUR FAMILY WITH YOU. The scenery of the North Woods and Lakes is very beautiful. The air is pure, dry and bracing. The climate is peculiarly beneficial to those suffering with

Hay Fever and Asthma.

The Hotel accommodations are good, far surpassing the average in countries new enough to afford the finest of fishing.

On and after June 1 Round Trip Excursion Tickets sold to Points in Grand Traverse Region, and attractive train facilities offered to tourists and sportsmen; also Mackinaw and Lake Superior Excursion Tickets. Dogs, Guns and Fishing Tackle Carried Free, at owner's risk.

It is our aim to make sportsmen feel "at home" on this route. For Tourist's Guide, containing full information as to Hotels, Boats, Guides, etc., and accurate maps of the fishing grounds, send to

Blue Ribbon
SILVER MEDAL

Were awarded to Messrs. G. W. SIMMONS & SON, of Boston, Mass.,

Through their agents and exhibitors Messrs. Brown & Hilder, of St. Louis, Mo., at the Exhibition of the "St. Louis Bench Show and Sportsmen's Association," for an unusually fine display of Duck, Mole-skin and Leather

HUNTING SUITS,

which attracted great attention and were much admired by all Sportsmen.

THE BOSTON SHOOTING SUIT.

Manufactured only by

G. W. SIMMONS & SON,
BOSTON, MASS.

NEW YORK AGENTS:

Fowler & Fulton,

300 BROADWAY,

The Best in Use.

ONLY ONE QUALITY MADE, AND THAT IS THE VERY BEST.

Flexible Waterproof, Tan-Color Duck.

Each article—coat, trousers, vest and hat cap—has the name and manufacturers' address stamped upon it, and no suit is genuine without it bears this imprint.

We make no discount except to the trade. The price of the suit complete is \$13.

The material is of the best quality of duck, waterproofed by a patent process. The color is that known as "dead grass shade."

The seams and pocket corners are copper-riveted, and nothing is neglected to make the whole suit complete in every way.

This is what one of our best sportsmen says of it, writing from camp: "Although I had been nearly eight hours under incessant rain, laboring and striving along under adverse circumstances, yet I found myself comparatively dry, and my clothes without a tear. For the benefit of our brother sportsmen, let me advise one of Messrs. Simmons' (of Boston, Mass.) Waterproof Suits. Oh! what a relief it was to find one's tobacco was dry, and that one could light a pipe; that you could laugh at your miserable friend, who stood shivering and shaking as if he had the palsy; and then, next morning, oh! what fun it was to see him mending his clothes, while I had not a tear to complain of! Ventilation, that great bugbear of waterproof suits, is legislated for in the most ingenious manner. No sportsman should fail to supply himself with a suit which is at once cheap, practical, and will last an almost indefinite time."

Our Flexible Tan-Colored Water-Proof Leather Coats, Breeches, Vest, Leggings and Caps are considered the finest things ever made.

Fisher's Muzzle-Loading Long-Range Match Rifle.

Interchangeable Grip and Heel Verner Scale, and Wind-Gauge Front Sight, with Spirit Level. Also English Wolout Pistol-Grip Stock.

This Rifle requires no patent muzzle to load it. Uses the same bullet as the Sharps and Remington rifles. Loads the same as breech-loaders, where they do their best work, viz., from the muzzle. As Perry's Score-book says: "No shells to cart around and pay for. Can be used at one-half the expense of the breech-loader. With powder and balls always ready for a day's sport." Every rifle guaranteed. Breech-loading rifles at manufacturers' prices. All long-range rifles sighted and tested at Creedmoor without extra charge. Agent for P. WEDLEY & SON'S BREECH-LOADING SHOT-GUNS. Send for Circulars. **H. FISHER'S** Illustrated Catalogue and Score-book for Rifle Practice, price 25 cents.

HOMER FISHER, 260 Broadway, Cor. Warren St., New York.

Bogardus' Patent Rough Glass Balls and Glass Ball Traps.

These Traps are the only ones that give satisfaction, as they are simple of construction, easily set, and not liable to get out of order, and they throw the ball in a manner that more closely resembles the flight of a bird than any other trap in the market. The Patent Rough Glass Balls are made of uniform weight and thickness, and have a corrugated surface that strengthens the ball for shipment to any part of the country, prevents the glancing of shot, and thereby insures the breaking of the ball when hit. **CAPTAIN BOGARDUS** was the first to introduce the **ROUGH BALL**, and at a price far below the smooth ball at that time.

Balls and Trap can be ordered through all Gun Dealers. Liberal discount to the Trade.
The option of the puller, is now ready for the market. Price \$8. Old Style, \$6.
Porties buying glass balls will receive, to each barrel catalogue 300 balls, Score book and rules for glass ball shooting, containing 40 pages.

HEADQUARTERS FOR BALLS, HAGGERTY BROS., 10 Platt Street, FOR TRAPS, HART & SLOAN, Newark, N. J.

Second and enlarged edition of "Field, Cover and Trap Shooting," by A. H. BOGARDUS, containing instructions for Glass Ball Shooting, and chapter on breeding and rearing of dogs by Miles Johnson. Price \$2, by mail, postage paid. Address, Capt. A. H. BOGARDUS, Elkhart, Logan (Co., Ill., Dec 6 11

IRA A. PAINE'S

FEATHER FILLED GLASS BALL.

PATENTED OCTOBER 23, 1877.

The "Standard" Ball.

The Bohemian Glass Works would respectfully call the attention of all dealers in Glass Balls to the fact that the Paine Patent Filled Ball is the STANDARD AND ONLY BALL MADE TO A SCALE, therefore we would respectfully caution the dealers against laying in a stock of unsaleable articles for the Spring Trade, when you can purchase the Best Ball ever made at prices less than those charged for other inferior balls. No other ball affords the PLEASURE of the Feather Filled Ball, and no other Ball is as beautifully made. It will break in every instance when hit by shot, and is sufficiently strong to prevent breakage either by transportation or falling on the grass.

Every ball is weighed and examined, then packed with the greatest care, in barrels of 300. Send for price list. Special inducements to the trade.

HEADQUARTERS BOHEMIAN GLASS WORKS, 214 Pearl Street, N. Y.

W. W. Greener's Champion Treble Wedge Fast, Breech-Loader.

THE WINNING GUN.

The winning gun also at Philadelphia, 1876, in the pigeon shooting match between Capt. Bogardus and Mr. South for \$500 a side, South killing 86 birds out of 100, using one barrel only.
The winning gun also at the great London Gun Trial, 1875, beating 102 guns by all the best makers of Great Britain and Ireland. THE PATENT TREBLE WEDGE FAST BREECH-LOADER is the strongest and most durable ever invented, and the most successful gun of the period. Patented in the United States, Oct. 5, 1875; No. 163,328. BEWARE OF INFRINGEMENTS OR IMITATIONS.

MAKE ME A SONG.

OUT of the silence make me a song,
Beautiful, sad and soft and low;
Let the loneliest music sound along
And wing each note with a wail of woe,
Dim and drear,
As hope's last tear.
Out of the silence make me a hymn
Whose sounds are shadows soft and dim.
Out of the stillnesses in your heart—
A thousand songs are sleeping there—
Make me but one, thou child of art,
The song of a hope in a last despair
Dark and low,
A chant of woe.
Out of the stillnesses, tone by tone,
Soft as a snowflake, wild as a moan.
Out of the darknesses flash me a song,
Brightly dark and darkly bright;
Let it sweep as a lone star sweeps along
The mystical shadows of the night,
Sing it sweet,
Where nothing is drear, or dark, or dim,
And earth songs melt into heaven's hymn.

FATHER RYAN.

For Forest and Stream and Rod and Gun.

Scenes in the Choctaw Nation.

NUMBER I.

IN one corner of my library, arranged in such a manner as to display its proportions to the best advantage, is an object which has for me a more than common interest, and which I cannot look at without being reminded of an adventure which will live in my recollection as long as memory itself. This object is the skin of what I am proud to believe was one of the largest panthers that ever fell before a hunter's rifle. Measuring along the curve of the back as the animal lay on its side, from the tip of the nose to the extremity of the tail, the tape line showed a distance of exactly seven feet, ten and one-quarter inches. Its sickle-like claws and ugly-looking teeth are something fearful to contemplate. In the centre of the forehead, and almost as exactly between the eyes as though the distance had been stepped out with a pair of dividers, is the orifice made by the passage of the bullet—the tangible evidence of a remarkable shot. This trophy was secured during a journey across the southeast corner of the Indian Territory—that portion of it occupied by the Choctaws—in the spring of the Centennial year.

But though the panther skin always reminds me of the incidents of that journey, such adventitious aid is by no means necessary to enable my memory to recall them. They made at the time too distinct an impression to depend upon souvenirs for recollection. The *mise en scene* was sufficiently novel, and the danger and discomfort sufficiently abundant to give to the various scenes and incidents that romantic coloring which shines the brightest and endures the longest on the frescoed walls of memory. In June, 1876, I found myself in Red River County, Texas, but with a determination not to stay there longer than I could possibly avoid. The speculation which had brought me there had ended, and the events rapidly ripening in the Quaker City were inviting me urgently northward. To go north, however, in the usual manner—by rail—was not what I fancied. I had come south that way, and for all the pleasure of the trip or the knowledge of the country obtained, I might as well have stayed in a St. Louis hotel reading the gaudy circulars of the M., K. and T. R. R. I was the possessor of a pony and of a light muzzle-loading rifle, and these articles suggested the idea of going at least part of the way "overland." I was not pressed for time, and the novelty of such a trip would more than repay me for its discomforts, if any such there proved to be. A young friend, by name Morgau Nichols, agreed to accompany me, and having made all possible inquiries as to the route, and laid in a few pounds of soda crackers to masticate on the road in the event of a scarcity of game, we started one bright sunny morning for the great Red River of the South.

The route we had laid out for ourselves, and which we followed with but slight deviations, was across the "Nation" to a place marked on the maps as Ultima Thule, but which every one we met called "McLean's Store," thence northeastward to Ozark, on the Arkansas, thence to Springfield, Mo., and from there to St. Louis. We expected the trip would last nearly a month, and would give us time to take the cars and reach Philadelphia by the "Fourth."

We crossed the Red River at a place called Mound City, a

Selected.

metropolis consisting of one dwelling house, one store house, and one dilapidated cotton gin. The river here was about forty yards wide, with a current of perhaps four miles an hour. I shall never forget the scene it presented. I had crossed the same stream a hundred miles farther west on my southward journey, but there I saw none of those elements of picturesqueness which were here so abundant. The water half cut a channel between steep banks of bright vermilion-colored clay, which stood some fifteen feet above the surface of the stream. From the top of these banks a level sward stretched away for several yards to where a thick and gloomy forest arose on the southern side, consisting chiefly of pines and oaks, while on the northern bank were more prominent the silvery green foliage of the cottonwoods. The trees were surmounted with their brightest toppings of changing green, which threw itself into varying shades as the leaves were stirred by a slight breeze blowing down the river. The morning sun, shining from a cloudless sky, threw into bold relief the open places near the river bank, with the deep and almost gloomy shadow of the forest. The gorgeous colors presented, the crimson hue of the stream, the brighter red of the sharply-cut banks, the brown of the tree trunks, and the gleaming emeralds of their tops were calculated to leave on the mind an impression which other scenes of greater beauty could not produce. There was no particular beauty here, but there was that indefinable *je ne sais quoi* which gives its charm to many a well-remembered spot. It was the mingling of the curious with the picturesque.

After crossing the river, our route for several miles lay through a curious tract of bottom-land, which differed almost totally from all other "bottoms" it had been my fortune to traverse. On the Texas side of the stream the bottom consisted merely of a thick forest of oaks, filled up with scraggly underbrush. On the northern side the bottom partook more of a swampy and tropical character. It could not be called a swamp, for the ground was hard and firm, at least along the narrow trail we were compelled to travel. Neither could it fairly be called a mere forest, though tall trees, literal "giants of the wood," spread their umbrageous foliage over the gloom below. Nor yet could it be likened to a canebrake, though canes grew there in abundance, their tall slender culms growing thickly along the trail, at times almost closing it in. I noticed that our ponies eagerly snapped at the narrow leaves as they brushed through them. The row of cottonwoods which grew along the river bank had grown thicker as we proceeded inward and were soon only to be seen at intervals, but their places were filled with other species. The water oaks were there, with gigantic pines of several feet in diameter; while here and there amid the gloom we could discern the wide spreading branches of the ugly excrecent cypress. Monstrous grape vines, the diameter of a man's body, stretched, anacardic like, from trunk to trunk, while the branches were heavily loaded and festooned with myriads of lianas, among them the perforated rattan. So thickly were the vines interlaced not only among the branches, but from them to the ground, that only at rare intervals could the sunbeams filter through and give a dim glimpse of the gracefully curved festoons. It was to me a very interesting place, reminding me as it did of scenes supposed by myself at least to be found only at a long distance to the southward.

As we rode along we found that in this net work of vegetable forms occasional openings appeared, and one of these was so curious as to excite remark. The trail passed through the extreme edge of it, and gave a good view of its strange features. It was circular in form and about seventy-five yards in diameter. On all sides was a wall of trees, their trunks and branches so closely interwoven with creepers as to resemble a finely woven screen of foliage colored wire. In the centre of the circle a tall tree had once stood, but had long since been broken off below the lowest branch, about forty feet from the ground. Around this trunk the lianas had clung and clustered until they completely covered it, forming a cone about thirty feet in diameter at the base by forty feet in height, and as regular as though formed by the hand of man. On the top of this cone, his body clearly outlined against the sky, a large blue heron was standing, apparently asleep. The beauty of the scene, as well as its strangeness, caused us both to draw rein and sit for a few moments in silent contemplation. While sitting thus the heron espied us and flapping his wings rose lazily into the air and was soon out of sight.

A ride of a couple of hours brought us out of the bottom and on to higher ground. The cypresses first disappeared, then the pines grew less frequent, the canes ceased, and we found ourselves riding through a forest of noble oaks, in which the narrow trail we had been following in the bottom widened to the dignity of a blazed road. This road we expected would lead to a place called Shawnee Town, where we had been directed to inquire for information about the road from thence to Graham's Ferry, a crossing on Little River, where we would in turn be directed to Ultima Thule.

Along this road we met with our first Indians—Choctaws, I suppose they were—and the impression left on my mind by this glimpse of the noble savage was sadly at variance with the ideas derived from the pages of Cooper and Mayne Reid. There were two of them coming along the road from Shawnee Town. The foremost was a middle-aged man with a very pleasant and benevolent-looking face. His companion was younger, with a more commonplace countenance, and with an expression lurking about the corners of the eyes which filled one with suspicion. Both were dressed in buckskin

hunting shirts, leggings and moccasins. The younger was bareheaded, but the elder wore around his forehead a bright colored band, and on his breast was a medal-like piece of shining metal. Neither of them was armed. Coming behind these, but several rods in the rear, were the "better halves"—squaws by name and squaws by nature, as Nichols afterward expressed it. They could not be called prepossessing in appearance, but were decidedly the reverse. Indeed, they were absolutely disgusting. They possessed not one trace of that "wild, untutored beauty" romance writers have been able to find in Indian maidens. It is true they were now on the shady side of middle age and might have been more attractive when young, but it was hard to conceive of beauty ever attaching itself to such libels on female humanity. Short and stout in body, with short, thick necks, square jaws, high cheek bones, monstrous ears, small evil-glittering eyes, low, black, wrinkled foreheads, and coarse, greasy and unkempt hair, they formed pictures that might well disgust any civilized man with the remotest idea of matrimony. They were clad in buckskin moccasins and leggings and cheap cotton gowns, plentifully besprinkled with beads. On the back of one of them, in a sack formed of a folded blanket, was a little papoose, his impish-looking head peeping over his mother's shoulder and tugging away at the pendant *mamma* she had lifted up to within his reach. On the back of the other was an army blanket, tied at the corners and loaded to its utmost capacity with the traps and "penates" of the family, and beneath whose weight the bearer almost bent double. Not a gleam of intelligence, not a glimmer of a smile enlivened their countenances as we lifted our hats in passing. A look of stolid stupidity was the only return for this act of courtesy.

Such is the result of nearly half a century of government protection and civilization of one tribe of wood Indians.

We soon arrived at Shawnee Town. We did not find it to be much of a place. It consisted of one large frame house, with the usual outbuildings, located in one corner of a large fenced field. On the opposite side of this field were several negro huts, to which we were directed to obtain information about the road. In one of these huts we found an old negress, who informed us that it was about forty miles to Graham's Ferry, and gave us directions as to the road. She was not very well posted on directions, and the most we learned from her was that about ten miles on we would come to a hut inhabited by an old Indian woman who would give us directions for the rest of the way.

The forty miles we had to traverse led us through a beautiful oak grove. Our route was marked by blazes on the trees, which were the only signs of a road visible. The trees were just far enough apart to allow an occasional glimmer of sunlight to filter through their branches, while beneath them was spread a green carpet of rich rank grass. There was no undergrowth, save here and there a clump of blackberry bushes covered with their half ripe fruit, and the sprigs that spring up around those spots where a fallen tree has lain for some time and given protection to the sprouting seed. We found but little to interest us, and the ride soon grew monotonous. A green carpeted grove may be—it is—a very pleasant place on a Sunday afternoon, when the goodie-laden picnic tables spread their inviting treasures beneath the shading branches, but to ride forty miles through such a grove, where the loaded tables and the pretty-faced waiters are absent, can hardly fail to grow tiresome.

As we rode along our ears were greeted by a constant rustling of the grass under our horses' feet. It was caused by the lightning-like darting of myriads of little green and striped lizards, as they scampered out of our path. At times a bevy of quail started up and whirled away into the distance, but as our weapons were both rifles, such opportunities were of no avail to us. We saw no trace of larger game, and we began to think that we might have some difficulty in getting our regular meals, for the crackers we had bought at starting had been all consumed, and they are but poor food at best. Occasionally, though not often, the road led us along the edge of park-like glades, where the blackberry bushes grew thickly. On the ground, or several inches above it, appeared the large plum-shaped fruit of the Mandrake plant, its yellowish plumpness appealing strongly to the palate of Nichols, tempting him at intervals to dismount and fill his pockets with the medicinal apples. At one spot we passed for nearly a mile through an opening which had been made in the woods by a hurricane. The stout oaks, varying from one to three feet in diameter, had been snapped off about three feet from the ground, and many of them were torn up by the roots. Fortunately for us no such storm arose during our journey.

Late in the afternoon a thunderstorm came up. A small cloud suddenly obscured the sun, cutting off the struggling beams hitherto filtering through the tree tops. In a few moments the entire heavens were overcast with dark rolling clouds, and a gloom like that of midnight enveloped the woods, until it was with great difficulty we could distinguish the road. Frequently we were forced to stop and examine the trees carefully in search of the "blazes." A long, low peal of thunder shook the forest, and a wind, slow at first, but rapidly increasing in fierceness, swept through the woods, bending the trees like willow wands, and filling the air with a sad, sighing music. A vivid flash of lightning, followed almost instantaneously by a deafening crash, and then the big drops came pouring down, and in less time than it takes to write it both of us were soaked from crown to sole. Flash

followed flash, and peal followed peal in quick succession, the rain coming thicker and thicker, and the murkiness of the atmosphere growing deeper and deeper, until at last we were forced to draw rein from inability to distinguish the road. Our horses, even, were affected by the scene, and kept snorting and prancing in terror. Suddenly a flash of bluish-colored fire was seen to start from the top of a tree not ten yards distant, and run in a spiral course to the ground, where it disappeared in the earth. At the same instant a heavier peal than had yet been heard reverberated through the woods, and a disagreeable smell, resembling burning brimstone, reached our nostrils, as if to render the scene still more hellish. The rain ceased, or only dripped from the soaking leaves above, the sky cleared, and in less than half an hour from the first sign of storm, the sun was shining brightly on a soaked but jeweled forest, his glinting rays as they played among the leaves lighting the pearly rain drops until the leafy canopy seemed resplendently sprinkled with diamonds.

As soon as the sky cleared we resumed our journey, first stopping to examine the tree which had been so suddenly smitten. It was a tall oak, about sixty feet in height, and from top to bottom, following spirally around the trunk, was a charred brand, some eight inches in width. We saw many trees afterward in that same forest bearing similar death marks.

This storm promised to render our night's camping disagreeable, for it was only a short time to sunset, and we were not sufficiently skilled in woodcraft to evoke a fire out of soaking timber. However, there was no help for it. Less than an hour after the cessation of the storm the approach of night warned us to look out for a camping-place.

There was not much choice as to location, and coming to a spot where there was a slight rise in the ground, we rode off for some way to the side of the road and made a halt.

How well I remember my first camp in the woods! It was years ago and far away from where I now write. It was on the bank of a crystal lake, in that portion of the Adirondack wilderness known as "John Brown's Tract." A dark background of evergreen trees, in the shadow of which was a picturesque bark hut, with a blazing fire in front and couches of hemlock twigs within. A string of trout lying on the sand undergoing the cleaning process, and a noble buck hanging horns downward from a branch near by. I shall never forget that scene however thickly similar scenes may be impressed on my memory. There was little resemblance between our present camp and that long gone first one I could not help recalling. The evergreens, the hut, the fire, the trout, the buck were all absent. The twig couches we could still provide, but instead of hemlock, we were constrained to content ourselves with the scraggly tips of oak underwood, the leaves still soaking with rain. However, we were too tired to be very fastidious, and after arranging our blankets and consuming a painful of half ripe blackberries we had picked on the route, we were not slow to betake ourselves to rest.

Ah! my reader, did you ever try to sleep under such circumstances? If so, you may remember that no sooner had you assumed a quiescent position than you felt something crawling over your skin. At all events we felt it, and found it impossible to sleep until we had divested ourselves of our clothing and picked some scores of ticks from our cuticles. I suppose all who are interested in wild sports are acquainted with the wood-tick. He makes the acquaintance of every one who passes an hour in the woods of the Southwest, and always leaves some souvenir by which he can and will be remembered. I have fought the black flies of the Adirondacks and have feasted the chigags of Texas, but I never met anything so disagreeable, to my notion, as the wood-tick. Their size makes them easily felt as they crawl over the skin, and the wound they leave behind them is often intolerable in its "itchiness."

Having annihilated the last tick we could find, and seen that our rifles were ready for any emergency, we again lay down and were soon in the arms of the drowsy god. "Tired nature's sweet restorer, balmy sleep," needs no better wooer than a long forest ride. Limbs that have for ten hours crossed a saddle, and eyes which have scrutinized the changing scenes of thirty miles of wilderness, soon overcome the most nervous wakefulness. The chirping of the tree toads and the mingling voices of myriads of night-loving insects, the lonely cry of the whippoorwill, the occasional hoot of an owl, and the noise of our ponies cropping grass, could not hinder the eyes from closing and the mind from sinking into forgetfulness. In less than ten minutes we were fast asleep.

GUY RIVERS.

[TO BE CONTINUED]

Fish Culture.

[FROM OUR REGULAR CORRESPONDENT.]

OUR WASHINGTON LETTER.

AN INTERVIEW WITH PROF. BAIRD—CULTIVATION OF CARP—THE NATIONAL CARP HATCHING ESTABLISHMENT—SOME FACTS ABOUT THEIR HABITS, CULTURE, VALUE, ETC.

WASHINGTON, D. C., April 23, 1878.

PROF. SPENCER F. BAIRD, the U. S. Commissioner of Fish and Fisheries, received your correspondent, in his office at the Smithsonian Institution, with that courtesy and hearty welcome which characterizes his daily intercourse with men in every condition of life. His office on the second floor of the building, just beneath the main tower, is a comfortable room, plainly furnished, but on the walls, tables and shelves are evidences of the valuable work performed by Prof. Baird and his energetic assistants in the propagation of food fishes. Life-size plaster casts of salmon, mackerel, carp, shad, bass, and almost every fish found in our rivers or along our coast, adorn the walls of this and the adjoining rooms. Models and drawings of various improved apparatus, used in the hatching establishments, are scattered about, and a few volumes, composing what may be called a working library, occupy a neat case in one corner of the room. Prof. Baird himself is a pleasant gentleman, large in frame as well as intellect. He is a man of great personal magnetism, always polite, and gifted with a ready command of language, as well as an agreeable tone of voice. He is about fifty-five years of age, of light complexion, and a close-cut beard, just tinged with gray, covers his face. Inviting your correspondent to a seat assigned to visitors at the end of his table, he kindly in-

quired after the folks in the home office, and expressed his gratification at the healthy and prosperous condition of *FOREST AND STREAM*, which he always reads with care. After returning my thanks I spoke of the national carp hatching establishment, now being prepared on the monument grounds just south of the Executive Mansion, in this city, knowing it would be of interest to your many readers in all parts of the country to have a description of that establishment, and the purposes of the government commissioner in regard thereto. I do not think I could do better than to tell the story in the language of Prof. Baird:

"Well," said the Professor, in reply to my question as to what progress was being made with the work, "Congress a short time ago gave us an appropriation, as you will see here" (handing me a copy of the "Deficiency Appropriation Bill," in which I read the following):

"For adapting the ponds in Monument Lot, in the city of Washington, to the culture of carp for distribution throughout the United States (the use of which lot, for the purpose in question, being hereby granted to the U. S. Fish Commission) the work to be done by the engineer in charge of public buildings and grounds, according to the plans of the U. S. Fish Commission, \$5,000 to be available immediately."

Continuing his answer, he said: "Of course we took advantage of favorable weather, and have pushed the work forward so that we hope to have the ponds ready for the carp by the first of April, and will begin the distribution of them next fall. Should we be as fortunate as we hope to be, there will be several thousand for distribution at that time."

THE CARP

is particularly adapted to warm and sluggish waters of the United States, and the warmer the water the better the fish thrives. Among the fish living on plants, it is the most desirable on account of its rapid growth and its great value for the table. In northern ponds and streams they hibernate through the winter, and during that time gain nothing in size or weight; but in warmer waters of the South they do not hibernate, and consequently are growing all the time. They thrive, however, in all waters, from deep cool lakes and rapid streams to the merest puddles and ditches. They usually attain a weight of about three or four pounds in as many years, and are said to attain an average weight of from five to ten pounds, and even more, according to the waters inhabited. There is no other species of fish that promises so great a return in limited waters. Being a vegetable feeder it thrives well upon aquatic vegetation alone, and is especially fond of water cresses and similar succulent plants. Its diet is varied, however, and it devours worms and insect larvae voraciously. Among the qualities which make it desirable to the pisciculturist are the following: It is very easy to produce from them a great many young; the fish is very hardy and has but few wants; and, finally, there is scarcely a fish with whose conditions and mode of living we are so well acquainted, as it has been raised for centuries, and has almost become domesticated. It grows very tame after a time, and may be taught to eat from the hand, to come to the side of the pond the culturist desires, and to follow him along its edge. The carp in the fish kingdom represents the cattle, sheep, deer and harmless herbivorous animals of the animal kingdom, while the black bass, pike and trout represent the lions, tigers, wild cats and voracious carnivorous members of the latter kingdom.

We have now in the ponds of the Maryland Fish Commission, in Druid Hill Park, near Baltimore, three varieties of this fish, all from the Danube and its vicinity. First, there is an improved variety of the ordinary scaled carp (*Cyprinus carpio*), the flesh of which is firm and flaky. The second is known as the mirror carp (*Cyprinus rez-cyprinorum*), almost entirely destitute of scales, having only a lateral line of them down each side of the body. The third is the leather carp (*Cyprinus nudus*) or naked carp, entirely destitute of scales, the skin being as soft as the finest velvet. The two last named are the best varieties, the leather carp especially, which ranks in Germany with the brook trout in this country, and sells for a sum equal to about twenty-four cents of our money per pound. The scaled carp is raised in Mecklenburg, Holstein, Bohemia and Silesia, the mirror carp in South Germany, and the leather carp principally in North Germany. It is believed that the fish was introduced into Europe from temperate Asia, and has spread from the Danube over the whole of Middle and part of Southern Europe. In its domesticated condition the carp has developed very many varieties, some of which are improvements in quality over the original type, while the contrary is true of others.

The following is a recapitulation of the good qualities of the carp: Fecundity and adaptability to the processes of artificial propagation; living largely on a vegetable diet; hardiness in all stages of growth; adaptability to conditions unfavorable to any equally palatable American fish, and to very varied climates; rapid growth; harmlessness in its relations to other fishes; ability to populate waters to their greatest extent; and finally its good table qualities.

A circular of the *Deutsche Fischer Verein*, issued in 1876, shows that in Northern Silesia, on the estate of Baron von Rothschild, puddles two or three feet deep in the villages are used for raising two year old carp for stocking distant waters. From this resource a single estate realized what would amount to about \$55 per American acre of pond surface.

Correspondent—I have noticed, Professor, that some amateur pisciculturists seem inclined to disapprove of carp culture, and declare it is not a desirable food fish.

Prof. Baird—Yes, there are some who have probably never seen a genuine carp, who declare it is a fish of no value. As an illustration, I may mention that I recently received what is called a carp, taken in the Hudson River, but it was nothing more than a goldfish escaped from some pond, and reverted to its first condition. Other specimens of what are called carp in various parts of the United States, were only aekers, eubs and the like, of no value whatever. The genuine carp has a little barb or feeler extending from each side of the mouth, while our so-called carp have not, and there is as much difference between the flesh of the two as there is between that of an ordinary sucker and brook trout. Even the English carp is a poor kind of fish, and it is only within the past few years that England has given attention to the propagation of the finer varieties from the Danube, such as we now have in Druid Hill Park. Our first importation of carp proved to be of a poor variety, and they were not propagated at all; but subsequent importations were of the more valuable species, and it is from them we have raised several hundred. You see, if we can put into a muddy pond food fish which will thrive and grow rapidly there is as much clear gain.

Correspondent—How does it rank as a game fish?

Prof. Baird—It affords no sport whatever to the angler that I am aware of, but its flesh is delicious.

THE HATCHING ESTABLISHMENT

in this city is composed of two ponds, each covering an area of about six acres in the monument lot, and within a few hundred yards of the Potomac River. One of the most valuable considerations is the power to regulate perfectly the supply and discharge of the water. The ponds or lakes were constructed out of a portion of the old canal and a neighboring declivity in the monument grounds by Gen. O. E. Babcock, when he held the position of Commissioner of Public Buildings and Grounds under President Grant. The natural formation of the ground rendered their construction so easy and easy and inexpensive that they were made as an ornament to that part of our public grounds under the name of "Babcock Lake." The body of water is divided into two equal parts by Meridian avenue, which extends from the Executive Mansion to the botanical gardens near the capitol, through the President's, Monument, Agricultural, Smithsonian and other public grounds.

A few months since Prof. Rudolph Hessel, an assistant to Prof. Baird, who has had much experience in the cultivation of carp in Germany, noticed that these ponds were admirably adapted to the propagation of the fish, and that they could be converted into a first-class hatching establishment without any great expense. If they had been constructed for the purpose they could not have answered it better, with a little additional labor rendered necessary to grade the bottoms, so that the water can be drawn off from either at will and the fish secured for distribution.

CONSTRUCTION OF THE PONDS.

In an establishment for the breeding and distribution of fish of this character it is, of course, necessary to have it so arranged that any number required for stocking particular waters may be secured and placed in proper tanks for transportation with as little delay as possible, and without the risk of injuring the fish. To accomplish this purpose, the portion of each pond bordering on Meridian avenue, above described, has been excavated to a depth of six feet, and at the lowest part of each a substantial pier of brick and Ohio stone, laid in the best hydraulic cement, has been constructed. From these piers a sewer extends some distance, connecting with one of the large sewers of the city in that locality, through which the ponds can be emptied. Surrounding these piers, and beneath the surface of the water, is a brick wall two feet in height, inclosing a space fifteen by twenty-five feet at the deepest part of the pond, so that when the water is drawn off the fish from all parts of the pond gradually follow it until they collect within the brick inclosure described, and are there dipped out with nets. The outlet from the ponds through the piers is so arranged by a system of sluice-boards placed on top of each other that the flow of the water can be controlled by one person, the waste always being from the surface instead of from the bottom so the fish cannot escape. The ponds will be so graded at the bottom as to remove all depressions from which the water cannot be completely drained, they being very objectionable, since a great number of fish are lost in them, and the removal of predaceous fish is prevented. The ponds have an average depth of 4½ feet, and the water supply for them is through a three-inch main from the Washington Aqueduct. By this they can be filled to the required depth. Besides, several beautiful springs exist near the margin of one of the ponds which constantly keep a supply of fresh water flowing therein.

THE BREEDERS.

In one of the ponds is an island of about half an acre upon which an embankment three feet high has been raised forming the breeding pond, which will be divided into three different sections for the breeders. The young fish will also be kept in three different sections until able to take care of themselves when they will be placed in the larger ponds to await the time of their distribution. The chief difficulty in rearing carp is that a large number of ponds is absolutely necessary in order to meet the expense of culture and make the time and labor bestowed upon it remunerative. In our national establishment we will have no such difficulty, as we have a complete system of ponds arranged for the breeders, young carp and mature fish, all so constructed that they can be easily emptied, and any voracious black bass, pike or other destructive fish removed, the black bass and pike especially being the most dangerous enemies of the young carp.

In the breeding ponds it is not necessary to introduce much fresh water during the spawning season, as the water in them would thus become too cold and retard or even completely frustrate the spawning and hatching process. During the spawning season (from about the middle of May till middle of July) the fish delight in warm brackish waters exposed to the sun. The females while surrounded by the males paste their eggs to water plants, and it is estimated that a medium sized fish will produce from 200,000 to 250,000 eggs annually. The ponds for the breeders can be kept absolutely clear of the predaceous fish. Besides the breeders there will be placed therein a few young carp one or two years old for chasing; old carp are said to be too inactive about spawning time, and the more the water is disturbed the better the eggs will be fertilized.

Three-year-old carp which have attained a weight of between three and four pounds are the most desirable for the table.

Prof. Baird now has about 400 superior carp in the ponds of the Maryland Fish Commission in Druid Hill Park near Baltimore, but it is not his intention to bring them all to Washington. More than half of them will be placed in the ponds above described, but the others will be kept in the Druid Hill Park ponds, so that in case of accident by freshet or otherwise he will still have a supply to fall back upon.

SALMON.

Having obtained the interesting views of Prof. Baird in regard to the carp I next referred to the California salmon culture and inquired what progress was being made in that branch of fish propagation.

Prof. Baird—I have every reason to believe that the California salmon will be the great food fish of the people of a large portion of the world. Besides having planted them successfully in our own waters we have sent them to the Hawaiian Islands, to New Zealand, Australia and other parts of the world where they are now thriving, and we have applications from Chili, Ecuador and other South American countries, and also from many European countries. Of 500,000 eggs sent to New Zealand last year and an equal number sent to Australia 95 per cent. hatched successfully, and the young fish are now thriving in the waters of those islands.

SALMON IN THE POTOMAC.

Prof. Baird then spoke of several instances where the California salmon have been taken in Eastern waters in which they were planted four or five years ago, and in answer to a

questloas as to when they might be expected to appear in the Potomac said he had every reason to believe that they would soon appear in these waters as well as in other streams with a rush. They were planted here, in the Susquehanna and various other rivers, about the same time in 1873 and '74, and it was then expected they would return to the streams in four or five years, so he would not be at all surprised at their becoming abundant within a short time. R. F. B.

ALBINO FISHES.—One of our leading fish culturists informed us the other day that Albino trout were quite common in his ponds; and we have since discovered by investigation that albinism is possibly as prevalent among both salt and fresh water fishes as it is among birds and animals—haddock, rock cod, groupers, butterfish (*E. onatitibi*), eels, gold fish, and other species furnishing the data. Melanism is common among trout, some specimens being of a very dark blue-black.

PENNSYLVANIA.—Salmon trout have been placed in the headwaters of Penn's Creek; 8,000 California salmon in the river at Renovo; 2,000 of the same in Paddy's Run, and 2,000 trout in Youngman's Creek, near North Point.

SHAD IN THE ALABAMA.—The fish from the Alabama River, recently sent to Prof. Baird for identification, has been pronounced by him "a fine specimen of the white shad, although not quite so large as it is found in Northern waters, but representing fully the best products of the St. John's River." This settles the shad question, so far as the fish of the Alabama and Coosa rivers are concerned, and the people of Alabama are to be congratulated on this valuable acquisition to their food industries. The Walumpka *Alabamian*, of a late date, says: "It is estimated that not less than 1,000 pounds of white shad have been caught out of the river, at this place, within the last week. Over 175 fine ones were caught on Sunday. Our market is so glutted with these delicious fish that they are selling for only 5 to 7 cents a pound."

—The Manchester, Mich., *Enterprise* says the eel artificial propagation is a success in the waters of that vicinity.

Natural History.

BIRD NOTES FROM LONG ISLAND.—No 2.

BY FRANKLIN BENNETT.

[Concluded.]

THE great-crested flycatchers have not been very abundant at Astoria for some years. Nests have occasionally been found in the orchards, but this last spring it became quite common, as many as six or seven nests coming to my personal knowledge. Their screams could be heard everywhere through the orchards and around farm-houses. On this day I watched a pair constructing their nest in an old golden-winged woodpecker's hole, in a dead limb of an apple tree, and upon a bluebird's nest, from which the eggs had been taken some weeks earlier. I concealed myself under a hay rick, at a distance of about forty yards, and observed them for over three-quarters of an hour. They had but just commenced, and in a few moments they both appeared, the female bearing a feather in her bill, which she placed in the cavity. In a moment they were off in the direction of a farmyard, and remained away nearly five minutes, returning by the same way in which they left. Their arrival was announced by the male, who, alighting on a neighboring tree, would utter his harsh shriek, while the female placed the feather or tuft of cattle hair which she had brought in the hole. This was repeated continually; they always left and returned in the same direction, the male acting merely as escort, without doing any of the work.

On the 13th I went to the nest again, and, as I approached, the female flew out and perched on a tree close by without uttering a note. I went up to her, but she flew off and did not reappear again, although I waited for some time. The nest, which contained five fresh eggs, is quite an elaborate one, being made up of a curious selection of materials. It is five and a half inches in diameter outside, and about one and a half inches deep; the bottom is partly of grass, which composed the bluebird's structure, woven in with large chicken feathers and bits of cattle hair, both white and red. The chicken feathers also formed the sides and bed for the eggs, together with cattle hair, a couple of tufts of soft white hair, evidently from some rabbit, a piece of muskrat skin, and pieces of the cast-off skin of a snake. Altogether it is one of the most interesting nests of this bird I have ever met with. A few days later I came upon another, which was being constructed likewise upon an old bluebird's nest, in a knot-hole in an apple tree. There was no very extensive attempt at a nest, only a few feathers. In the bluebird's nest, however, were four of its eggs spoiled, and the fly-catcher had deposited three eggs above these. I left them untouched, hoping to get a full set in a day or two, but when I returned I found all had been laid, but two were broken, and the nest was in a state of confusion and the birds gone. Now, the cause of all this mischief could not be imagined until further investigation revealed another hole in a tree, not twenty yards distant, containing three young mottled owls about four or five days old. The parent bird was perched upon a limb overhead, and blinked down at me as I was trespassing upon her home. She no doubt was the cause of the desertion of the eggs of both bluebird and fly-catcher, for she no doubt, on her nocturnal tramp, found the bluebird early in the spring, and on the increase of her family, made another trip to the larder. From this very hole, where the owls were, my friend, Mr. C. S. Allen, took a set of six eggs of the same bird early in May, and this was evidently the second brood. In April, 1872, I took a set of five eggs, and Mr. Allen has had another set since then from this same nest. There are several places where I am sure to find the eggs of this owl every year. It is very common on this part of Long Island. They have been found in both plumages. In 1870 I found a set of eggs with a gray parent, and the parent of the young spoken of above was red. In 1873 I found six young in New Haven, Conn., where both parents were red, and I watched them until they

were able to fly, when I captured five of them, which were distributed around, and, as far as I was able to trace them, they retained the gray plumage. Two which I brought home and kept for a couple of months, and then placed in the Museum in Central Park, retained their gray plumage for over a year, when I lost all trace of them. The majority that are found in Astoria are of the red variety.

On this same day (May 30), while passing through a patch of peas a grass finch (*Poocetes gramineus*) started up from her nest, which was placed in one of the rows and sunk so that the top was on a level with the ground and very neatly concealed. It was almost entirely composed of old pea vines, to which were added a few coarse grasses, and it was sparsely lined with horse-hair. It contained four eggs partially incubated.

June 2d was bright and clear with a cool breeze blowing, and a teapung day for woodland investigation. Several of the discoveries of this day have been mentioned above for the sake of continuity, but there were a few things noted of which nothing has been said. On the borders of a salt water inlet, in which were four acres of the long-billed marsh wren (*Telmodytes palustris*) in various stages of construction. As there were only one pair of birds to be seen I judge they must all have belonged to them. Some ten days later I examined these nests again but found only one inhabited and containing five chocolate eggs. These birds are common all through the salt meadows and many of their nests can be found, but only one out of every three is occupied.

A colony of red-winged blackbirds had taken up their quarters along this same stream, and their "conk chere" note was very decided in objecting to any trespass. The nests, of which there were about a dozen, were all placed at least two feet from the ground, and some as high as six feet. The lowest were in wild rose bushes, the others in swamp willows. In a swamp not a mile distant they nest in the grass as is their usual custom. Nearly all the nests contained eggs, the majority of them freshly laid; their size varied very much, some sets being very much smaller than others. While going through a rather solitary piece of woods and looking up I spied a green heron (*Ardea virescens*) looking down from her bundle of sticks and on the alert to depart with a farwallow croak. On climbing the tree I found five eggs just on the point of hatching, three of them in fact being already picked. Nearly every piece of woods around contains a nest or two of these herons, and likewise of the night heron, but the latter, which five or six years ago were very abundant, are rapidly leaving, and in a short time there will be none left. The shore in the vicinity of their breeding place is being used for docks and other purposes, and persons are continually digging for clams, etc., so that they are unable to obtain their food without going a long distance in search of it, and this has undoubtedly had as much influence in driving them away as the persecution of so-called sportsmen.

A red-eyed vireo (*Vireo olivaceus*) had just laid one egg in a nest found, and a lot of young crows were on the point of leaving their home.

June 4.—Found another nest of the least fly-catcher containing four fresh eggs. These were hatched on the 17th, and in eight days the young were able to leave the nest.

July 4.—A set of young catbirds left their nest, and on the 18th the parents were carrying materials for a new one.

On July 27, the last day to which my notes have been brought, a brood of young robins were taking their first lesson in flying when one more unfortunate than its fellows fell to the pavement and was instantly killed.

For Forest and Stream and Rod and Gun.

HABITS OF THE RUFFED GROUSE.

THERE has been so much written about the ruffed grouse that it may seem to the general reader that nothing more remains to be said, but having seen very few articles upon the subject that gave this best of game birds any credit for its many good qualities without qualifying the statement with some slur or insinuation that, to say the least, "condemns with faint praise," I propose to tell you "what I know about grouse."

I am a plain, unlettered countryman, brought up among the green hills of New England, the home of the noble bird I love so well. My pen is but a poor stub at best. Had I but the inspiration of that glorious sportsman, "Frank Forrester," then might I hope to express some portion of the feelings that stir my soul to its inmost depths, when on some beautiful October morning, with eager dogs and trusty gun, I seek their favorite haunts. I feel that I shall come far short of doing justice to the subject, as the high-flown words and well-rounded periods that read so well are entirely beyond my reach.

There! having fired my shot I feel better, and we will now proceed to business. Let us visit the ruffed grouse in his native "wiles" (I think that is original). In the first place, although I presume that you are aware of the fact, I will state that they are the most wily and cunning bird in the world; full of tricks and dodges to cheat the honest sportsman out of his dinner. But the very fact that they are so crafty only adds to the enjoyment and gives a zest to the pleasure that is not found in the pursuit of any other bird. I could fill columns with the story of my wrongs; of how I have been cheated and fooled by the sly wiles when they could not get away. Perhaps the relation of a few instances may prove interesting; they certainly were to me, and I do not recall a single one in which admiration for their skill and good judgment did not much more than repay me for my disappointment at their escape. In the fall of '59 I lived in Connecticut and hunted the whole season through. About half a mile from my house, and in a direct line with a famous hunting ground that I was in the habit of visiting quite often, was an alder run that nearly always contained one or two birds. There was a heavy stone wall running the whole length of the piece, near which I had started an old cock grouse several times, and had not succeeded in getting a shot. I had never followed him up, as he invariably crossed a stream at the lower end of the run that I could not get across without going some distance. One evening, on my return from a rather unsuccessful tramp, my dog came to a point near the wall. Thinking how easy I had him this time, I walked in forward of the dog, when, like a young hurricane, this vile bird rose and gave us to understand that he was going, like a rocket, straight for his cover on the other side of the stream, instead of which, after attaining an elevation of about twenty feet, as I was complacently taking in the entire situation and calmly waiting for him to get away the

proper distance when I would deliberately cut him down in his pride, he suddenly, and with a twist of his tail that was very aggravating to my feelings, made a swoop downward within a foot or two of the ground, and left me on the other side of the wall. I still comprehended the entire situation, but not with the unforeseen calmness, without which no one can ever hope to successfully cope with an old cock grouse. A few days later, with the remembrance of my defeat still rankling in my bosom, I concocted a plan to get the best of that bird; in fact, the whole of him. I placed my little brother at the head of the run with the old dog, and, giving him my watch, told him to wait just ten minutes, and then start with the dog and beat through the run toward me. I very cautiously went round to the place where he invariably crossed the stream, and was congratulating myself upon my successful strategy, when a whoop from my brother gave me warning of a point. I signalled him on and decided that I would lay out the old cock just on the bank of the stream, about twenty-five yards to my right. A confused flutter in the brush, and a loud "Mark" from the boy, started my pulse a little faster, and when I caught sight of the bird my blood fairly boiled—he was going the other way. He started out of a little clump of bushes and flew directly at my brother, within three feet of his head; he made a grab at him and missed. About the same time he missed my watch, and, for aught that I know to the contrary, as I have never seen it since, that bird wears that watch, and shows it to admiring crowds of his friends, and tells them how he got ahead of my time.

This was many years ago, but I still retain a vivid recollection of the scene. I trust that I have grown wiser since, and I think that the birds have too, as they still succeed in getting away with me quite often. Only last fall, while out with a companion for a day's sport, we started one of those crafty birds several times. Each time there was some plausible excuse why we did not bring him to bag. There would be the trunk of a tree in the way, or a rock, and at last we had a dead sure thing on him in a hazel thicket, with both dogs on a staunch point on one side, my companion at the end where he must show himself, myself opposite the dogs, forming a triangle, with the bird in the centre. Of course, with "straight powder" no bird could escape this situation. Any one can see at a glance that his days were numbered. Brother sportsman, sympathize with us in our great bereavement. That bird, in the language of the immortal Webster, "still lives." He burst from the thicket about twenty feet from my companion, and probably did not know that he was there until he reached the top of the brush—like the fellow that was going to jump from the top of a building into a pile of shavings, but when he got half way down some one shouted, "Glad in the shavings," he immediately stopped and went back. Just so this bird went back on us. He pitched suddenly to the ground, and, alighting behind a big rock, ran for his life. We heard him a moment after rise from a safe distance, and caught a glimpse of him as he scaled up the side of the mountain, where we could not follow. My companion expressed himself perfectly satisfied—was glad he escaped—so smart a bird ought to live. I did not argue the point with him, as there was a far-away look in his eye, and an expression about his mouth that made me think that comments from me were uncalled for. A few days later I had occasion to remember with profound satisfaction my "golden silence." We were heating down an alder run that swung round in a half circle from a piece of large timber. I was on the inside, and we had nearly reached the lower end when a wary old bird sprang from below us, and started nearly toward me for the timber. When opposite, and not more than ten feet from me, I turned slightly to get in good position, at the same time saying to my companion, "This makes eight" (we then had seven in the bag). Then this wretched bird, that I thought so simple, quicker than thought turned and made a dive straight at me, and passing within three feet of my head, plunged through the middle of a small pine tree behind me. I was so worked up that I did not even hit the pine tree when I fired, and to this day, although every other incident is strongly impressed upon my mind, I cannot recall the direction in which my gun was pointed at the time of the discharge. But, alas! for the gallant bird; he had played his last trick. My companion stood just in the right place, and there was no sheltering place. The scalp of the game bird now adorns the belt of his deadly foe. I felt very grateful to my companion in that he made no invidious remarks upon the occasion.

We have since talked it all over, and I find that in his forbearance he was only reciprocating former action on my part. Thus you see that virtue sometimes has its reward. The above are only a fair sample of many, very many, similar instances that these eyes have beheld. And, reader, although you may be skeptical upon the point, do not deny me the right of my belief, that for sly manoeuvres and successful tricks, an old cock grouse will discount Joey Bagstock and the Heathen Chinee.

RUFFED GROUSE.

FERRISBURG, VT., March 24, 1878.

Yesterday a warm south wind was blowing, and I saw a purple Finch, and on the lake a vessel making her way northward, and robins and song sparrows were singing merrily. To-day a real winter snow storm with a howling north wind holds possession of our land, and the poor birds are in doleful dumps in the shelter of barns and thickets. What a deal of interesting information you are publishing concerning ruffed grouse. But I think J. P., of St. Paul, is wiser, or else the Minnesota partridges have most remarkable habits. I've a mind to start a theory. How would this do? The partridge hammers with his bill on a hollow tree, after the fashion of a woodpecker. I have never seen him do it, but doubtless he might if he chose, quite as easily as to pound a log with his wings—which I never saw him do either, but I have seen him drum on a rock. As to alighting on trees or on the ground when dashed by a man they are as apt to do one as the other here, except toward nightfall and there is much snow on the ground, when they usually "tree," or when dashed by a dog that pursues them barking they almost always take refuge in a tree, I believe. I am much gratified to learn that I am not the only one of those who attempt it who cannot bring down the ruffed grouse in his flight oftener than once in — times, that is to say, not always every time. To tell the honest truth, the shot I have expended on them would probably many times outweigh all the partridge I ever bagged. But I will keep trying, it amuses me, and it doesn't hurt the birds much.

AWABOOSSE.

CORNING, N. Y., March 23, 1878.

EDITOR FOREST AND STREAM:

Least the subject might be forgotten, I will contribute my experience in reference to the female partridge drumming. While in St. Lawrence Co. in 1867 I shot a partridge on a drumming log, which proved on dissection to be a female. As I found none other there, and the drumming being repeated several times before I could get sight of it although I was within three rods, I concluded that she must have done

the drumming. As some unhealthful or unnatural excitement will cause the hen to crow, and I have seen one hen trying to render male services to another hen, I see no reason why like influences might not cause a female partridge to drum.

Speaking of Albino deer, it might not be out of place to state that a white deer was killed in the Adirondack region near Cranberry Lake by a young man named Marsh, who was hunting in company with Jaa. McKee, Jr., of Edwards, N. Y., in the fall of '75. Mr. McKee requested me to confer with some taxidermist about preserving it, but what disposition was made of it I have not been informed. D. C. M.

LINNEAN SOCIETY.—At the meeting of the Linnean Society, April 20, a dozen members were present. Mr. George N. Lawrence was elected Honorary Member. Papers were read by Mr. John Lawrence on the Pilgrim Islands in the St. Lawrence, and the birds found breeding there. The secretary read a review of Robert Ridgway's "Ornithology of the Fortieth Parallel." Also the following communication from H. A. Purdie, of Boston, relative to a previous paper:

"I read with much interest the Society's discussion on the nests of *Empidonax traillii* and *aculeus*. May I ask (referring to the eggs of '*traillii*' found at Great Manan by Mr. Pearson) what 'nearly white' means? Does this mean that the eggs were not spotted at all, or that the usual creamy tint was wanting, though the surface was normally spotted with reddish? As but one species of this genus (*E. forsteri*) is now recognized as extending from the Atlantic to the Pacific coasts, it is interesting to know if both in Grand Manan and Dakots it sometimes produces unspotted white eggs. The nests at least have much varied, *pusillus* building in the West an *astoria*-like structure, *traillii*, in the East, a loose, bulky, *cyanospiza*-like home. But, if I am not very much mistaken, the bird building in hollow trees in California is *E. difficilis*, now considered a good species. At any rate, *difficilis* does so breed, and if *pusillus* also, it will be a very interesting fact. Recently taken and thoroughly identified nests and eggs of *E. flaviventris* are a great desiderata at the present moment. The Smithsonian Institution has three sets labeled *E. flaviventris*, one with nest-eggs spotted, collected by Mr. Boardman at Calais, Me., or its vicinity; the other sets from Halifax, N. S., or Grand Menan, with eggs unspotted. But Messrs. Ridgway and Henshaw have lately written me that these two sets strongly resemble eggs of *E. minimus*!

THE SPARROW VANQUISHED AT LAST.—We all know that the sparrow is a regular prize-fighter, who can whip anything feathered of his weight and inches. His prowess is not only historical, but self-vaunted; for does not the pugnacious fellow admit his own murderous deeds in the nursery rhyme, where it reads:

"Who killed Cook Robin?
'I,' said the sparrow."

But the battle is not always to the strong. The tide of victory sometimes sets the other way, as in the instance which our Salem correspondent relates below. The gentleman in genteel dress of blue and buff, it seems, proved too much for the "rough" in rusty brown. Occasionally the bully is mistaken in his man. We quote:

"MR. EDITOR: Last Wednesday morning a pair of blue birds were about my bird house. Soon appeared a troop of sparrows and a row occurred, in which a single sparrow and a blue bird had it out, and I am happy to say the blue bird won, and the sparrows, all of them, soon cleared out. That they are pugnacious, this fact proves; that they are more so than some natives, particularly the swallow (*T. bairdii*) I do not mean to imply; but, in our section of the country, I think they might be dispensed with. Should think the starlings described in last issue by R. O'C., of Dublin, were much better birds to import, if necessary to do so at all, which I question. Yours, R. L. NEWCOMB."

BOOMING OF THE BITTERN.—*Editor Forest and Stream.*—In one of Thoreau's essays it is stated that the booming of the bittern, with which most residents in the country are familiar, is produced by the bird by first sucking up a quantity of water and then holding its head up and ejecting it in successive spurts, uttering at the same time its peculiar cry, like the driving of a stake. Can any of your correspondents confirm or disprove this statement? I never but once saw the bird in the act of booming, and then at too great a distance to see the spouting of water from its bill, if there was any; but I plainly saw a violent jerking of the head and neck at every cry. Chicago, April 2, 1878. H. W. T. E.

[This is a very old notion, and one which has been confirmed by no recent observations. A similar belief was that the bill of the bird was put inside of a reed to increase the sound. Mr. Endicott, in his admirable article on this species, says: "The truth is, of course, that the bird uses no means to produce its bellow but its own organs of voice."—Ed.]

SPRING ARRIVALS.—*Fort Hamilton, L. I., April 6.*—The following species are reported: Feb. 26, bluebirds. I believe these have been here the whole winter. They were heard in January in Montclair, N. J. March 2, red-winged blackbirds; March 4, cow buntings; March 7, crow blackbirds (*Quiscalus versicolor*); March 7, pewees; April 1, fish-hawks; April 5, barn swallow. In your last issue I see an account of a cardinal grosbeak seen in Central Park. Two years ago my friend, H. A. Wheeler, obtained one on Staten Island in January. He supposed it to have been an escaped bird. Your correspondent also speaks of song sparrows as early visitors. There is not a day of the year but they can be obtained here. D. L. B.

THE EUROPEAN STABLING.—*Editor Forest and Stream.*—Seeing in your valuable journal the opinion expressed that the European starling is a singer, and that being not in accordance with my limited observations of these birds when in Europe, I addressed the inquiry to the well known ornithologist, Howard Saunders, Esq., on this point, and here you have his answer: "Starling singing! No; no real song, but he sometimes whistles half a bar, and then breaks down, and is a good imitator of a whistle or squeal. I heard one on my house at Reigate continually repeating the squeal of *Milvulus ictericus* (kite) long after my tame bird had gone to the Zoo (Zoological Gardens, London)." T. M. B.

Boston, Mass.

EARLY BIRDS.—A Painesville, O., correspondent writes: April 7, while two of our citizens were taking a stroll, their

setter came to a point on a brooding woodcock. One week later the young were found to be hatched and gone. Was not this early for woodcock? Awo."

ARRIVALS IN CONN.—*Milford, April 12.*—Our black martlets have again established themselves in their old quarters. Last year it was the 21st of April, being earlier this year than before in five years. QUILL DRIVER.

Woodland, Farm and Garden.

THIS DEPARTMENT IS EDITED BY W. J. DAVIDSON, SEC. N. Y. HORTICULTURAL SOCIETY.

HARDY AZALEAS.

THE cultivation of this beautiful tribe of plants is not so general in this country as it should be. We have several fine species inhabiting our woods known as "honey-suckles," and producing that curious growth on their leaves caused by the puncture of an insect known as "May-apple," and it is probably on account of their being natives that we so lightly esteem them, as well as so many other gems of our native flora, although abroad it is considered as furnishing more floricultural treasures than any other country. Experience has taught us that formerly it was almost useless to cultivate native plants, shrubs and trees for sale, as, when offered, a contemptuous shrug of the shoulder, and the expression, "Why, they grow in the woods!" was all sufficiently condemnatory, and the Ailanthus was taken in preference to the Tulip tree, and a Hydrangea in preference to an Azalea or Kalmia; and yet if, the Azalea was one of the Chinese varieties it would sell readily and be universally admired.

It is a pleasure to observe that a change has come over the public in this respect, and we have no doubt that the beautiful groups that adorn our principal parks and country seats have a great deal to do with the estimation in which they are now held. Our principal nurserymen grow them in large quantities, and some, like the Messrs. R. B. Parsons & Co., and S. B. Parsons & Sons, of Flushing, make specialties of Rhododendrons, Azaleas, Kalmias, and other similar plants. Our native varieties are all well worthy of cultivation, and though it is somewhat difficult to transplant large plants with success, young plants about six inches high, if taken up carefully and planted in nursery rows in the garden for a few years, will make good plants ready for transplanting into the shrubbery, or planting in groups as individual taste or necessity may dictate. It is better, however, to obtain them from the nurseries, where they are raised from seed, and, being often transplanted, are furnished with a good stock of roots. The earliest to bloom of our native species is *A. nudiflora*. This is very common; grows from four to six feet high, flowers in May and June before the leaves are produced, and from growing in moist, swampy places, is generally called "Swamp Honey-suckle."

A. viscosa is also a lover of swampy ground, and grows from four to ten feet high, bearing in June and July large clusters of fragrant white, rose-colored or striped flowers.

A. arborescens is a native of the mountains of Pennsylvania and the Blue Ridge in Virginia. It grows from five to fifteen feet high, the flowers, which appear in June, are large, fragrant and rose-colored like *A. viscosa*, make their appearance after the leaves are developed.

A. calendulacea grows on the mountains of Pennsylvania and the Carolinas, and ranges from three to ten feet in height. It bears in May a large profusion of large, showy flowers, of various shades of yellow, orange and flame-color, and is one of the most showy of the genus.

As these varieties are all liable to sport in color, even in their native state, advantage was early taken of this tendency by European nurserymen to produce an immense number of varieties by cross fertilization, crossing each species with the other, and again crossing these hybrids with each other, using in the process another species, *A. pontica*, a native of Turkey, to aid in the operation. The Belgian nurserymen have been especially successful in this, so much so that the hybrid varieties they have given to the world are universally known as Ghent azaleas. The hybrids produced are very beautiful, comprising all shades and combinations of color in white, yellow, orange, copper, flame-color, rose, crimson, brick-red and purple, many of them being beautifully striped as well. All who visited the display made by the Messrs. Parsons at the May exhibition of the N. Y. Horticultural Society, at Oilmore's Garden, last season, cannot but remember the fine specimen plants, as well as the gorgeous colors of the beautiful groups of these plants, there exhibited. Many of the finer sorts are grafted on strong growing stocks, and are perpetuated by name.

There are also some other species of Azaleas which, though generally cultivated in the Greenhouse, prove to be tolerably hardy, especially in dry, well drained soils. *A. amena* is a very neat growing sort, with bright, rosy crimson flowers and small, bright, evergreen leaves. *A. indica alba* is also quite hardy in some localities. There are some very large specimens of it to be found in Greenwood, and no plant can be more chaste and effective for cemetery purposes. *A. phoenicea* and other species and varieties from Japan may prove hardy also; if so they will be valuable additions to our list of ornamental shrubs.

Palms as House Plants.—*Land and Water* has this to say of house plants:

The India-rubber plant, *Ficus elastica*, is a splendid room

plant. Its large, thick, leathery leaves, hold and handsome in appearance, are uninjured by dryness or dust, or change of temperature; it lives contentedly, drinking in water through its roots largely and revelling in occasional sponging of its leaves. It is a rapid-growing plant when it has room for its roots, and even when it has become pot-bound, it will maintain its leaves green and healthy for a long time if kept well supplied with water. But there is always danger of overdoing in watering, and many a plant is lost through this cause. An India-rubber plant should be kept near the window in the light; there it can grow tall, making a leafy ornament, and an inside edging of green to the window-frame. Then there are the greenhouse palms, such as *Chamaerops exulta*, *C. fortunei*, *C. humilis*, which do not require fire-heat during the winter (none of the palms will stand freezing.—Ed. P. E.), and can therefore be placed in entrance-halls, corridors, etc. "Palms," remarks Mr. B. S. Williams, in his most useful book on "Stove and Greenhouse Plants," "are among the easiest plants to cultivate with which we are acquainted, their chief requirements being good drainage and an abundant supply of water to both roots and foliage. In the latter case, however, be sure it is clean. Perhaps the greatest error it is possible to fall into in growing palms is to keep them dry at any period of the year." In their native habitats they are found on banks of rivers, almost or quite in the water; others, if at a distance from springs, are yet only found in humid places. Those who grow palms in rooms should keep them standing in pans of water, and be careful to sponge the foliage frequently. As for *Distia lurida*, and its handsomely variegated variety, *Variegata*, they are capital room-plants. The bold leaves stand well for a long time in a dry atmosphere, requiring to be kept cleansed from time to time. Like the palm, it is a water-loving plant, and should not be allowed to suffer for the want of it.

LOUISIANA FOR EMIGRANTS.—*Abbeville, April 10.*—*Mr. Editor:* I perceive from your columns, as well as those of other papers, that many people are looking for new homes and desirable localities. Believing that south-western Louisiana, and especially the Parish of Vermilion, offers as many inducements as any country in the world, I present a few of the many advantages it offers for the consideration of those who wish to remove: The soil is very productive and land cheap; the population sparse; the climate delightful throughout the year. Lying along the shore of the Gulf of Mexico, and fanned by its cooling breezes, the summer heats are never oppressive. Snow and ice are seldom or never seen. The health of this region is excellent. Yellow fever has never (but once) visited this portion of the State. The land is mostly rich prairie, of a black, loamy character, producing corn, cotton, rice, sugarcane, Irish potatoes, sweet potatoes, oranges, plums, figs, bananas, peaches, etc., in abundance. It is a very fine stock country also, the grass lasting nearly the whole year. Vermilion River, running through the parish (county), is navigable for steamboats and schooners throughout the entire year. Good, rich unimproved prairie land can be bought near navigation for from \$1.50 per acre to \$5. Game of certain kinds is very abundant. The game resources of this region are better known in London than in New York, and it is visited every winter by English sportsmen. One hundred snipe per day is not a big bag to make for a good shot. One man, a "Britisher," was reported to have bagged 1,000 snipe in one day on the marshes of the adjoining parish of St. Mary. Geese, ducks, brant, curlew, etc., by the millions all winter. Woodcock, plover, sandpipers, partridges, snipe and prairie chickens abound; bear and deer few. Further information given on application to W. W. EDWARDS.

A TENNESSEE POULTRY FARM.—*Nashville, April 11.*—A farm near this city is to be devoted entirely to fowls. The spot selected seems an excellent one for the purpose, the ground is undulating, dry, sandy, and rocky, well wooded, and a never failing stream running through it, on the banks of which is enough arable land to grow what grain will be necessary to feed them. There are at present on the place 2,800 hens, which number is to be increased to 5,000 when the improvements are finished. At present this large number are running together, but it is the intention of the owner to subdivide the farm into walks or runs large enough to contain each from two to three hundred hens. J. D. H.

—A grand Stock, Agricultural and Mechanical Fair will be held at Nashville next October. The Stock Breeders Association of Tennessee and the owners of the Fair Grounds having agreed upon terms, the buildings are to be repaired and the grounds put in fine order.

The Kennel.

TO CORRESPONDENTS.—Those desiring us to prescribe for their dogs will please take note of and describe the following points in each animal:

1. Age. 2. Food and medicine given. 3. Appearance of the eye; of the coat; of the tongue and lips. 4. Any changes in the appearance of the body, as bloating, drawing in of the flanks, etc. 5. Breathing, the number of respirations per minute, and whether labored or not. 6. Condition of the bowels and secretions of the kidneys, color, etc. 7. Appetite; regular, variable, etc. 8. Temperature of the body as indicated by the bulb of the thermometer when placed between the body and the foreleg. 9. Give position of kennel and surroundings, outlook, contiguity to other buildings, and the uses of the latter. Also give any peculiarities of temperament, movements, etc., that may be noticed, such as suffering, etc.

FIXTURES FOR 1878—BENCH SHOWS.

The Westminster Kennel Club (New York) Bench Show, Oilmore's Garden, May 14, 15, 16 and 17. Dr. W. Seward Webb, Secretary.

BALTIMORE KENNEL CLUB.

ANNUAL EXHIBITION OF THE BENCH SHOW OF DOGS.

BALTIMORE, April 23, 1878.

Under the best of auspices, with a most pleasant day and fully on time, by nine o'clock this morning the Baltimore Bench show was duly opened. The building in which the show is held was ample as to room, the Masonic Temple having, if anything, more superficial area than the main room used in Boston. Two stories were used, the large auditorium being devoted to sporting dogs, and a room below to the non-sporting dogs. Mr. Charles Lincoln, the able superintendent,

has by this time so fully mastered all the intricate machinery of a dog show, that in arrangement of kennels, in feeding and watering, in attendance, all the minutiae are admirably cared for. At an early hour the building was well filled, and a good number of people were at the show during the whole of the day. In judging the dogs a raised platform was used, which answered fully all purposes, and when the critical examination of the dogs took place it was carried on with commendable celerity. The officers of the club, J. Addison Smith, Esq., the President, L. R. Cassard, Esq., the Secretary, with the Executive Committee, Messrs. T. A. Symington, A. Jenkins, Jr., M. D. Groverman, R. Stuart Latrobe, and H. S. Zell, were all in attendance, and the representative of the FOREST AND STREAM AND ROD AND GUN had to thank them for facilities given him in collecting information.

Now, a dog show may or may not present special features. Recalling the exhibition given by the Massachusetts Kennel Club, we took occasion to remark that it was the class of native New England setters which was to us the most brilliant part of the show. These dogs were not only excellent, but were in large quantity. We are only too glad to notice that in the Baltimore kennel this most excellent feature is again presented. In the Baltimore show were exhibited no end of likely dogs, and already the care and good judgment taken by the members of the Maryland Kennel Club is asserting itself. In importing our native stock other people may not think as we do, but we must confess to be tired somewhat of seeing those revolving stars which coruscate incessantly at Bench shows, and which are always crowned. Of course it may be said quite justly, "Since those dogs which won the prizes are the best, how is it to be helped?" To this we must reply that we want, if not fresher element in the animals, at least more judges or a diversity of them. Bench shows have followed one another in such rapid succession, at only a few weeks intervals, that prize dogs are quite monotonous creatures. When a dog has won in St. Louis or Boston, why, it had become pretty certain that he would win in Baltimore, or if transported during the next month to San Francisco, that he would win there. We again must declare that we have no fault to find with Mr. Davidson, believing that his ability in regard to judging dogs is only equalled by his sense of right. But how can it be expected that the gentleman can go back on himself?

Now, if any one supposes that the position of a judge at a bench show is an easy one he is very much mistaken. The precipitancy of the thing, the rapidity with which dogs have to be handled and passed on prevent us apparently in our judging of dogs, from having more than one judge, still we think that we will never, in the United States, do entirely away with grumbling, until we have more than one judge to declare as to the merits of the sporting class of dogs. If for non-sporting dogs there are two judges, why not have two for sporting dogs? The judging began on the day of the opening at about 3 o'clock, Mr. Davidson working with the sporting dogs and Dr. Twaddell the fox terriers, bounds and all non-sporting dogs, assisted by John H. Duval, Esq., for the Chesapeake Bay dogs.

In the champion class there was some half-dozen entries, and the winner was Mr. P. H. Bryson's Gladstone, who has been distinguished straight through from her puppy days. A very fine white, black and tan ticked dog, Royal Duke, owned by G. B. Clason, of Milwaukee, was a V. H. C., while Warwick and Crack were both highly commended. In the bitches there were some ten good ones. Floss (No. 13), owned by J. H. Whitman, of Chicago, won the blue, while Petrel, the mother of Gladstone, had a V. H. C., and Magnet, the last year's winner in Baltimore, received a similar recognition. Belle, a promising blue Belton, and Brenda were H. C.'d. Now we defy any one to say that they ever saw a better lot of red setters than those exposed in class 2. Mr. G. W. Ggilvie's Ben, a son of Elcho's, took the blue, Berkeley, of the St. Louis Kennel Club, by the same sire as Ben, with Race, another 2-year-old from Elcho, were both V. H. C's. In this class there was a coal-black dog which wasn't red, Irish he might have been, but red he wasn't. In the champion Irish bitches (class 2), they were all good. The St. Louis Kennel Club won the blue with Duck (No. 26). Firefly, belonging to Mr. Gause, of Wilmington, Del., coming in with a V. H. C. We should not forget Nors, owner Mr. R. Neville, of Fauquier Co., Va., who had also a V. H. C., and, we think, ran Duck very close. In the champion Gordons there were two entries, both good. The winner was Rupert, belonging to the Goldsmith Kennel Club, of Toledo, Mr. A. A. Mellier's King getting a V. H. C. In the bitches all good, the Goldsmith Kennel won again with Fan. In fact the whole lot of these Gordon bitches were good ones, and they all had V. H. C's. Sensation was winner in the champion setter class, Mr. Edmund Ggill's Flake getting a V. H. C. Everybody knows Sensation, a really superb dog, but Flake has also claims to attention, as a close built, muscular, well put together dog, with no end of fine points about him. In bitches, if Mr. Ggill was Very Highly Commended with Flake's position among the champion dogs, his fine Rose had a walk over in the bitches. Whether opposed to a single bitch or a whole line of them Rose is very hard to beat.

In the imported English setter dogs, Mr. Clason's Royal Duke was first, Mr. Gause's Warwick had the red ribbon and Crack had an H. C. In the bitches, Petrel—spoken of before, such a good little one—deserved the blue, as did Gift the second prize. There were three V. H. C's given, one to Mr. Von Culin's Ollie (No. 47), one to Pickles, owned by Messrs. Whitman and Waller, of Chicago, and one to Brenda, owned by Capt. Foster. As the evening was approaching and light in-

sufficient, the English setter dog puppies were the last judged. Pelham, owned by Capt. J. W. Foster, of Leesburg, Va., being first, and Mr. Allie Hardy's Dandy (No. 50) being second.

In Chesapeake Bay Dogs there were a great number of good ones, there being some twenty odd. The winner of the dogs was Tim Crisp; of the bitches, Juno.

We give the winners in the various classes of non-sporting dogs as far as were carried out on Tuesday.

Class 13—Chesapeake Bay Dogs—1st, Rob. Tip Crisp, Brooklyn, Md.; 2d, Rollo, W. F. Levering, Baltimore; V. H. C. Buck, G. N. Pagelo, Baltimore; H. C. Gull, G. Brown, Brooklandville, Md.; C. Jack, C. Brown. Bitches—Juno, N. E. Johnson; 2d, Fan, W. N. McCay, Baltimore Co., Md.; H. C. Pirates Bess, W. S. Isaac, Baltimore. Puppies—1st, Keener, Dr. J. Wilkins, Baltimore; V. H. C. Sinbad, S. J. Martenet, Jr., Balto; Crook, C. Brown. Class 25—St. Bernards—1st, Don, J. P. Haines, N. Y.; 2d, Rover, E. Bowen, Balto; V. H. C. Bob, J. C. Steintrauer, Balto. Class 26—Newfoundlands—1st, Hayee, H. W. Livingston, N. Y.; 2d, Leon, C. T. Crane, Balto. Class 29—Dalmatians—1st, Spot, J. Peabair; 2d, Ring, same owner; C. Spot, W. J. Montague, Balto. Class 33—Black and Tan Terriers—1st, Flora, F. G. Linck, Balto. Class 34—Skye Terriers—1st, Tom, R. McLellan, N. Y.; 2d, Donald, W. Sanderson, Phila. Class 35—Yorkshire Terriers—1st, Bright, W. A. Haines; 2d, Beauty, same owner. Class 37—Scotch Terriers—1st, Rob Roy, J. P. Elliott, Balto; 2d, Dick, J. H. Cottmann, Balto. Class 38—Toy Terriers—1st, W. A. Haines; 2d, Beauty, same owner; H. C. Flora, J. F. Beard, Balto. Class 40—Italian Greyhounds—1st, J. Lowry, Balto.

SPECIAL PRIZES.

Classes 68, 69, 70—Best Chesapeake Bay Dog—Rob. Tip Crisp. Bitch—Dido, G. A. Jessup, Langford, Md. Puppy under 12 mos.—Sinbad, S. J. Martenet. Class 73—Best Scotch Terrier—Elliott's Rob Roy. Class 74—Best Skye Terrier—McLellan's Tom. Class 75—Best Black and Tan Terrier—Linck's Flora. Classes 79, 80—Best Chesapeake Bay Dog and Bitch—Tip Crisp's Flora. Class 87—Same (short haired)—Tip Crisp's Rob.

The leading gunsmiths in Baltimore had very handsome displays of their very excellent work at the bench show. We can only mention at present, for want of space, the admirable guns exhibited by Messrs. Clark & Snyder. The Parker guns were also on exhibition. A stand was filled with the Remington rifles, and Mr. McCoombs, the well-known gunmaker, had also a fine collection of arms. We trust in a subsequent article to give this exhibit a more extended mention.

ENTRIES AT THE BALTIMORE BENCH SHOW.

DIVISION FIRST—SPORTING DOGS—CHAMPION CLASSES.

English setters, 17; Irish setters, 10; Gordon setters, 6; Pointers, 6.

OPEN CLASSES.

English setters, imported or their progeny, 12; English setters, native, 84; Irish setters, imported or their progeny, 16; Irish setters, native, 22; Gordon setters, 27; Pointers, large, 11; Pointers, small, 15; Pointer puppies, 13; Chesapeake Bay dogs, 18; Irish water spaniels, 2; Retrieving spaniels, other than Irish, 4; Clumber spaniels, 1; Cocker spaniels, 7; Foxhounds, 15; Beagles, 14; Dachsunds, 6; Greyhounds, 5; Fox terriers, 7.

DIVISION SECOND—NON-SPORTING DOGS.

St. Bernards, 4; Newfoundlands, 7; Shepherds or Collie dogs, rough, 10; Shepherds or Collie dogs, smooth, 2; Dalmatians, 4; Bull dogs, 2; Black and tan terriers, under 11 pounds, 1; Skye terriers, 6; Yorkshire terriers, 2; Scotch terriers, 2; Toy terriers, 3; Pugs, 3; Italian greyhounds, 2; Miscellaneous, 1; Native setters, any strain, 16; Imported setter dogs, any strain, 3; Imported setter bitches, any strain, 7; Pointer dogs, 4; Pointer bitches, 2; English setters, brace, 3; Irish setters, brace, 4; Gordon setters, brace, 1; Pointers, brace, 3; Native setters, brace, 2; Imported English setter stud dog with two of his get, 3; Native do., 3; Irish setter stud dog with two of his get, 2; Gordon do., 2; Pointer stud dog with two of his get, 1; Native English brood bitch, with two of progeny, 2; Imported do., 2; Irish setter do., imported or native, 2; Gordon setter do., 3; Native English setters, under 12 mos., 5; Imported do., 1; Gordon do., imported or native, 6; Irish setter do., 2; Pointer do., 3; Fox hounds, not less than two couples, 4; Double fox hounds, 12; Best couple beagles, 3; Chesapeake Bay dogs, 2; Chesapeake Bay bitch, 1; Chesapeake Bay Puppies, under 12 mos., 2. Class 71, 2; class 72, 5; class 73, 2; class 74, 4; class 75, 2; class 76, 1; class 77, 6; class 78, 3; class 79, 3; class 80, 5; class 81, 8; class 82, 5; class 83, 4; class 84, 6; class 85, 7; class 86, 3; class 87, 4; class 88, 1; class 89, 1; class 90, 0.

BOSTON DOG SHOW RIBBON.—The second prize in Class 17 at the Boston Dog Show was awarded to No. 445, Jack, late Tohy, belonging to Captain McMurdo, of Westfield, N. B.

THE WESTMINSTER BENCH SHOW CLASSIFICATION.

EDITOR FOREST AND STREAM:

It has been stated, in private and in print, that the Westminster Kennel Club care very little for an attendance of sporting dogs at their coming show, but are catering especially to the owners of the non-sporting dogs; and are directing their efforts to produce a grand show of pet animals—a show to delight the ladies of Gotham, and to lure the pockets of the club with shekels, inasmuch as the population of the city will attend the show conducted upon such a basis, and the attendance is what the Club seek, rather than that a show should be given having as its ultimate object, the improvement of the sporting dogs of the country.

If this be so it is good to know it, and the sportsmen of America had better leave their stock in their kennels than take them to a show conducted under such auspices and for such purposes.

Sportsmen and sporting journals condemned the speculative shows held in Boston, Hartford and Baltimore last year by irresponsible parties, who cared nothing for the dogs and everything for the dollars; and how much quicker ought condemnation come from sportsmen when a recognized kennel club holds a show for just such an object.

The classification of the setters at the coming show gives color to the facts above stated, when we find the imported and native classes thrown together for judgment, and an Englishman imported to judge them. We put no imputations on Mr. Lort, but accord him the name and reputation of a gentleman; but he comes here a lover and breeder of the "field trial" and other strains of English dogs, and cannot escape a prejudice in favor of the so-called "blue-blooded" dogs.

Among many of our own sportsmen no native dog stands an equal

chance with the blue-blood or his progeny, unless the native shows the conformation and physical types and the color of the present fashionable imported strains. What sort of probability of gaining a prize does a native black, or black and white, dog stand if he happens to have a long, handsome ear, or has a short body, however well he may be ribbed or cheated; although his loins may be as strong as a horse, if his legs are a little long and send him like an antelope, and he can stay to his work all the season, and show staying qualities that would kill the blue-blood with his long body and short legs? None at all; because the blue-bloods are to-day—by their admirers—assumed to be the types to breed to, and it is not entirely true. Some of our "off-color" natives cannot be surpassed, physically, by the inbred imported animal, and to make the new arrivals from across the water the standard to breed up to, is wrong. Give us what is good in them, and reject the rest, and recognize in full the excellent qualities of the home-bred animal.

Therefore, when the New York club throws thus unjustly together the imported and native setters, and continues the one-man power in judgment, the judge bringing to us his old-world predilections in favor of the dog bred upon English soil, the only remedy remains of keeping our dogs at home.

YALE.

[We by no means agree with our correspondent as to the idea he entertains that the coming New York Bench Show caters especially to the owners of non-sporting dogs. A large metropolis like New York has all varieties of animals, sporting and non-sporting, and every kind of dogs ought to have a chance to win prizes. We must beg to differ again with "Yale." We are more than ever in favor of doing away with classes of imported dogs. It is fully time that our native breeds should be put collar to collar with imported dogs. If the advantages of breeding from the best English animals or direct issue from them, have not already declared themselves, they never will. Of one-man power in judging we are inclined to be on "Yale's" side, but without casting the least imputation on Mr. William Lort, to whose thorough knowledge of dogs is added the utmost fairness and impartiality.—Ed.]

SPECIAL PRIZE LIST—NEW YORK BENCH SHOW.—No dog or dogs, their get or progeny, can be entered for any of the following prizes unless they have already been entered in the champion or regular classes, and an additional fee of two dollars will be charged for all such entries. In judging stud dogs and brood bitches, the judges will be instructed to consider the sire or dams as well as the get or progeny.

Class A—Best pointer dog, any weight, a Parker gun, won by Sensation at the Boston Bench Show, 1878. Value, \$300.

Class B—Best brace of pointers, over 50 lbs., without regard to sex, and owned by one person. \$50.

Class C—Best brace of pointers, under 50 lbs., without regard to sex, and owned by one person. \$50.

Class D—Best pointer dog, any weight, to be shown with two, and only two, of his get. \$50.

Class E—Best pointer bitch of any weight, to be shown with two, and only two, of her progeny. \$50.

Class F—Best pointer puppy, under 12 months old, dog or bitch, a combined gun case and sportsman's traveling trunk, manufactured and presented by Messrs. Thomson & Son. Value, \$40.

Class G—Best setter dog of any strain bred in the United States from native parents. \$50.

Class H—Best setter bitch of any strain bred in the United States from native parents, a handsome single driving harness, presented by N. J. Demarest & Co., Newark, N. J. Value, \$75.

Class I—Best English setter bred in the United States, a solid silver cup, manufactured by Messrs. Tiffany & Co., and presented by F. O. De Luze and Spratt's Patent Blount Co. Value, \$100.

Class J—Best English setter dog, to be shown with two, and only two, of his get. \$50.

Class K—Best English setter bitch, to be shown with two, and only two, of her progeny. \$50.

Class L—Best red or red and white setter dog, to be shown with two, and only two, of his get, a handsome double-barrel breech-loading shot-gun, presented by W. W. Greener, Esq. Value, \$200.

Class M—Best red or red and white setter bitch, to be shown with two, and only two, of her progeny. \$50.

Class N—Best black and tan setter dog, to be shown with two, and only two, of his get, a handsome double-barrel shot-gun, manufactured and presented by Parker Bros., of Meriden, Conn. Value, \$300.

(White markings allowed on dogs competing in this and following classes.)

Class O—Best black and tan setter bitch, to be shown with two, and only two, of her progeny. \$50.

Class P—Best display of foxhounds, consisting of not less than three couples, a handsome silver cup, manufactured and presented by Messrs. Tiffany & Co. Value, \$100.

Class Q—Best mastiff, dog, bitch, or puppy, a silver collar, chain and muzzle, manufactured and presented by Messrs. W. T. and J. Mersereau. Value, \$50.

Class R—Best St. Bernard, smooth coated or rough coated, dog, bitch, or puppy, a silver cup, manufactured by Messrs. Tiffany & Co., or cash, \$50.

Class S—Best Cocker Spaniel, dog, bitch, or puppy, a silver cup, manufactured by Tiffany & Co., or cash, \$50.

Class T—Best fox terrier, dog, bitch, or puppy, a silver cup, manufactured by Messrs. Tiffany & Co., or cash, \$50.

Class U—Best bull terrier, dog, bitch, or puppy, a silver cup, manufactured by Messrs. Tiffany & Co., or cash, \$50.

Class V—Best Yorkshire blue and tan terrier, dog, bitch, or puppy, a solid silver cup, manufactured by Messrs. Tiffany & Co., or cash, \$50.

Class W—Best pug, dog, bitch, or puppy, a solid silver saucer, presented by G. DeForest Grant, Esq., and manufactured by Messrs. Tiffany & Co. Value, \$75.

The following railroads and steamboat lines have already agreed to carry dogs free to and from this show, when accompanied by the owners: New Jersey Midland, Erie, New Jersey Southern, Central of New Jersey, Pennsylvania R. R., Delaware, Lackawanna and Western, Lehigh Valley, Boston and Albany, N. Y. Central, New York and New England, Fall River and Stonington lines. All the express companies have agreed to bring and return dogs for one rate for the round journey. G. W. R. and Grand Trunk railroads of Canada, will bring dogs free and issue round trip tickets at one and one-third fares.

MINNESOTA KENNEL CLUB.—This club, recently organized, has for officers: President, B. Beaupre, St. Paul; Vice-President, Gen. H. H. Shibley, St. Paul; C. J. Butler, Stillwater; E. T. Archibald, Dundas; Wm. Mullikin, St. Cloud; D. O. Estes, Lake City; A. C. Rand, Minneapolis; Col. Henry Poehler, Henderson; George Warner, Mankato; Ben Randall, St. Peter; J. C. Mcloy, Hartings; H. E. Brown, Faribault; J. C. Prendergast, Le Sueur; John Hutton, Windom; Thos. P. Cantwell, Brainerd. Secretary and Treasurer, W. S. Timberlake. Executive Committee: C. B. Dille, Lake City; E. F. Warner, Wm. A. Hamilton, S. Lee Davis, C. McIntyre, C. Gotzian, Chas. Zimmerman, H. Shipman, C. S. Uline, C. Seabury, R. Warner, St. Paul; Mr. Lyons, Faribault.

It is proposed to have a bench show at St. Pauls in September next on the occasion of the State fair. We have no doubt of the success of the Minnesota Club. The material already exists in abundance in the State. We have long ago made up our mind that it is in the West that the coming dog of America will be raised.

NEW YORK BENCH SHOW.—The entries for the coming show in this city are fast coming in, and there is every reason to believe that the exhibition of dogs will exceed in interest the initial show of the Westminster Kennel Club. Premium lists and entry blanks may be obtained of Chas. Lincoln, Sup't, 33 Murray street.

A CORRECTION.—In our notice of the Muirkirk Kennel, of Prince George's, Maryland, the printers turned Captain Nicholson's Nig into Meg. N-i-g is the way the dog spells his name.

MR. BERGH ON HYDROPHOBIA.

Hardly crediting that Mr. Bergh was no believer in hydrophobia, we addressed a letter on this subject to the President of the Society for the Prevention of Cruelty to Animals, and we have been favored with a reply. It seems that Mr. Bergh is quite skeptical in regard to hydrophobia. We may remark that there are still some very intelligent people who do not believe in Jenner nor inoculation from small pox. Of course, we cannot agree with Mr. Bergh or his authority, Professor Maschka. The diagnosis of hydrophobia, as most lucidly explained by Sir Thomas Watson, differs from tetanus. We do not think "that the mind is master of the situation." How can Mr. Bergh explain the case of one death from hydrophobia in New York, the patient being a child between two and three years? (FOREST AND STREAM, Vol. IX. p. 437.)

EDITOR FOREST AND STREAM:

In response to your polite inquiry "whether it is true that I am a disbeliever in hydrophobia as a specific disease," my answer is that I am so, and for the following, among other reasons. Professor Maschka, who is at the head of the University of Prague, and is an acknowledged authority all over Europe, declares that all the symptoms ascribed to hydrophobia are to be met with in various other diseases, and that many persons suffering from apparent hydrophobia have never been bitten by any animal at all! He therefore concludes that it is not a specific disease, but only one occurring under certain conditions incident to various diseases. Buckmuller and Lorinser shared his opinion that it is a nervous disease, resembling tetanus; that it may follow an injury as well as occur without any previous injury or bite. Stadthagen treated twelve persons who had been bitten by dogs supposed to be mad. Of this number only one showed signs of sickness, and recovered. Cramer relates that, in the year 1852, in Hamburg, 100 persons were bitten by so called rabid dogs, and that only one died of symptoms of hydrophobia. Lorinser, of Vienna, successfully proves that no specific disease is produced in man from the bite of a mad dog. Even inoculation has failed to establish the contagion theory. Hartwig cites 137 dogs bitten by rabid dogs, and of all these, only six died with symptoms of hydrophobia, while the rest remained perfectly well. According to Buckmuller, after extensive experiments in inoculation, entirely different symptoms, such as nervous fevers, catarrhal fevers, inflammation of the lungs, etc., ensued, and inoculation with the blood of dogs supposed to be rabid showed no ill effect whatever! On the other hand, however, cases of assumed hydrophobia have occurred, produced by wounds of the most trivial nature, such as a scratch with an iron nail, hardly drawing blood. Maschka relates a case of a man who died of a slight scratch upon his nose from the paw of a dog. Yet this case, after a carefully conducted *post mortem* examination, gave no other indications than such as tetanus reveals.

The sum of all this is that the mind is master of the situation, and if the theory recently advanced by a surgeon of this city—viz., "morbid impulse"—be correct, then it follows that the mind is parent, not only of all moral disorders, but physical as well. If the fellow who knocks you down and takes away your watch acts only in obedience to a "morbid impulse" for the acquisition of timepieces, is not the same organ capable of generating hydrophobia or cholera as well? Respectfully,

HENRY BESON, Pres't.

MANGE.

FROM a most thorough paper in the *Veterinary Journal*, due to Dr. J. A. Nunn, we make the following condensed abstract: Mange is divided into three kinds—Scabies or Scurvy Mange, Follicular Mange and Red Mange. **RED MANGE.**—The first symptoms are itchiness and uneasiness, followed by the formation of minute pimples resembling fleabites. The first two stages are not often seen in practice. The second stage is likely to be mistaken for the *Eczema rubrum*, which is a non-parasitic disease. Red points are found under abdomen, inside of thighs, and when skin is thickly coated. Uneasiness shown in feeding or drinking, from itching, is nearly always diagnostic. There is a rapid loss of hair, chiefly on back, ears and neck. The pimples burst, either by the dogs breaking them or naturally. The exudation of these pimples drying forms crusts that attain a certain thickness. Bran-like scales or scurf accumulate on the upper eyelids. In old cases hair is matted in tangles. Red points spread rapidly, the parasites being conveyed by the claws. All these symptoms are only helps in the diagnosis, for it is only the microscope which absolutely determines the disease. The *acari* or parasite, are not easy to find, whereas, in man, with itch, or scabies, the human *acari* are found, in dogs it is more difficult. Treatment—Wash the dog with soft soap and warm water and scrub with a soft brush. Break down accumulation of scales with the thumb nail; wash so as to soften skin so as to allow better action of medicament to be employed. Character of dog must be taken into consideration when ointments, salves or preparations are used. With long-haired dogs shaving may be necessary, if not by a razor, with shears. Most common dressing is sulphur and lard, which is sufficient, provided the whole of the affected parts are dressed so that none of the *acari* escape. Slight quantities of caustic potash or soda (we should prefer the latter—Ed.) would be useful in breaking down the scales. Sulphur ointment has the decided advantage of being harmless in case the dog licks it, which invariably happens. A dip made of glycerine and carbolic acid might be found useful, but it should be remembered that with some animals other than sheep it has a fatal effect. The objection to creosote, with decoctions of tobacco,

—the latter often used for sheep—is that they both discolor the hair, and have a disagreeable odor. Professor Oamgee gives the following formula: creosote, 1½ parts; spirits of wine, 15 parts; water, 11 to 14 parts. Apply twice or thrice, with intervals of a day or two. In using tobacco care must be taken. The decoction of tobacco is made by pouring 25 to 30 parts of hot water over one of leaf. Immerse a dog in this from five to ten minutes, not more, and apply warm. A stronger decoction, say one part from 5 to 10, will poison an ox. [We have seen a large dog killed from ignorance in using a decoction of tobacco for mange, though properly managed as to quantity of tobacco used and time of both—we have seen excellent cures.—Ed.] This preparation is to be recommended on account of its cheapness. Stavesacre seed (*Delphinium staphisagria*) digested in olive oil—1 of seeds, 8 of oil—at a temperature of 100 deg. Fahrenheit, is good to apply on pet house dogs, as it has no smell and does not color the hair. Of the preparations of mercury, blue mercurial ointment and the green iodide are commonly used. Both should be used cautiously, as by being absorbed salivation may take place. They are best employed when small spots are affected. [We have seen a dog paralyzed in all his limbs from an ignorant use of blue ointment.—Ed.] As constant irritation reduces the dog, certain tonics are necessary. Arsenical liquor in five drop doses three times a day have good effect, also sulphate of quinine in 3 to 5 grain doses. Laxatives may be necessary, such as a dose of castor oil. Exercise should not be forgotten. A bed of pine sawdust has been recommended, but this may have the effect of causing the dust to stick to the sores on the dog and to cake. Pine shavings are just as good. No matter what may be the material used in bedding, it should be changed twice a week and the old bedding burned. All kennels that diseased dogs are housed in should be washed with lime containing carbolic acid, in the proportion of a pint of common brown acid to a bucketful of whitewash. For at least a month after a dog has had mange in a certain kennel, this kennel should be free of occupants.

(To be continued.)

ROCKET.

A valuable cocker spaniel, owned by C. E. Scott, editor of the Rod and Gun column of the Bucks Co. Gazette, Pa., was run over and killed last week by the cars at Bristol, Pa.

It was only a dog, they said, not worth making a fuss about. Aye, it was only a dog, but a dog possessed of a higher order of intelligence than some men whom I have met. It was the work of a moment, when my old sporting friend rang the bell and sent word to me that my dog had been cut in two by the cars, to leap from the bed and hurriedly dress and run to the depot. There upon the bank, a cruel cut through bone and muscle evincing the nature of his death, was Rocket. Truer blood never coursed through veins than could be traced in him back through long pedigree. What though it was all native. The little tuft of white on the back of his head, the long silky feather from legs and stern had marked in like manner his ancestors for over thirty years to my own knowledge. Rocket was a cocker-spaniel, bred by William Rhile and brought to me two years ago by Ben Mortonby from the Neck, that part of Philadelphia where the true cocker is known, kept and loved. Careful training and faithful nursing through the diseases incident to puppyhood, had brought him to such condition that he was looked upon as the boss railbird and woodcock dog of the section. Nor was this his only qualification. Better watchdog never lived. Often too has he been deputized as watcher over the baby as she sat tied into her low chair. Never tiring, the spaniel would fetch back and place in her hand the playthings which she delighted to throw to the farther part of the room, and afterward pick up and carry each one out to the basket in the dining room where they were kept. When she slept he sat by the cradle, and at the slightest stir would raise his paw and gently rock it. Did the women folks like him? Well, if you had heard the difference of tone when Snipe, the big orange and white setter, came lumbering in from that which was used when Rocket lightly stepped in the door, you would have placed the odds on the spaniel. He was the only one of his kind that I ever knew to stand rail birds. Not that he stood them as a setter stands, but when he scented them in the tussocks there was always a backward look for the gun and a patient waiting for the master before the plunge was made. How he got out that night, or why he attempted to cross the track in the face of the swift rolling wheels of the express, is a mystery. It may have been that life was to him, as to many, full of toil and trouble, from which he sought release, or it might have been that a tramp had enticed him away and his hurried flight homeward was intercepted by the train. Suffice it that the children mourned him and his master was compelled to content himself with useless regrets.

To-night, as I look down from my desk at the rug where he was wont to curl himself as I sat writing through the long evenings, I miss him. Kickers and cuffers of dogs may sneer, but the man who cannot love a gentle spaniel, brimful of affection for its master, has no heart in him. SIGMA.

Bristol, Pa.

HOUNDS POISONED.

APRIL 18, 1878.

EDITOR FOREST AND STREAM:

Some fiend has again commenced his work of destruction of my pack of hounds by a poison which soon carries off its victims. Driver, by Watchman, out of Mischief, full sister of the peerless Vanity, as my estimable friend Pious Jeemes called her, is the first sacrifice. Last year, in the midst of the hunting season, some of my choice bounds met the same fate. Four of them, with Watchman at the head, were first-class red fox dogs. Driver was a special favorite. His color was a beautiful blue speckle, his hair short and as smooth as that of a pointer. His form was compact and strongly knit together; but what was best of all was his action and style, well supported by unflagging energy. He was a perfect representative of the Byron stock. The loss of Driver has sickened me, and in my present mood would sell out to a purchaser worthy to follow such a pack as its master. I consequently invite an immediate correspondence on the subject from the owners or proprietors of kennels. There is no guarding against this description of warfare on hounds. They will prowl at night, and in the day if kennelled at night. To kennel them from season to season, night and day, would impair their vigor and health. Apart from this, the inconvenience and trouble are too great for general practice. It is a very easy matter in this section to destroy whole packs by a judicious distribution of some deadly poison. If hounds be kennelled at night, they will then prowl in the day. The poison could then be admin-

istered to selected victims, and the vindictive could then at his pleasure pain you where it was most painful.

T. G. T. of Gaston.

P. S.—I take this occasion to state to the Hon. Jno. E. Keens, of the H. of R., from West Virginia, to whom I had promised a pair of puppies by Driver out of Bell, that I cannot comply to the full extent of that promise. But that driver was put up with Aggy, a splendid young Byron slut, not well tested in the chase yet, and he shall have a pair from her.

T. G. T.

FOX STRATEGY.—Back here in the country, about all the winter sport we have is fox hunting with gun and hounds. I want to tell you about an old fox that bothered me a good deal last fall. I used to start her in about the same place every time, and no matter how good the following, the dogs would lose her. I knew that they did not run her in, as I could tell by their feet that they had not been digging. She used to take a straight line and lead the dogs right out of my hearing, and that would be the last I knew of them. I found at last it was no use, so when they started her I would start for home. I made up my mind to know about it when snow came, but it was a long time before I could start her on a snow. Finally one fine morning the dogs raised her. There had been a fall of about two inches of moist snow in the night, and I knew Madam Reynard would have to work to get away. She soon led the dogs out of hearing, but I took the track, bound to know where she went to if it took a week. Well, I followed on about three miles till I came to the brook. Here, somewhere, must be where she slips them, I thought. But no; she kept on down the brook, which is about twenty to thirty feet wide, for half a mile or more, past several bridges. She had taken every wall that the wind had blown the snow from on her way, and had got some ways ahead of the dogs. But walling it didn't amount to much, only she gained a little on the dogs, and gave her more time for her finishing stroke. For the last half mile she had kept within a foot or two of the bank of the brook, with long jumps, till she came to a long still stretch of water about three feet deep. Here she came down to a trot or walk and turned off from the brook again toward a long wall upon the side hill, which the wind had blown the snow from, and here the dogs were at work, first one way and then another. I took the wall and followed it a quarter of a mile or so, finding a track once in a while where a little snow hung on the wall, till I came to where there was a long stretch that was not blown off and no tracks over it. Then I went the other way, but I could not find where she had left. Finally I had to give it up and started for home. Following along back on the track, something made me get down on my knees and examine the track. Then I began to see how it was—she had gone up and down that wall for a blind. Finally she came back, and taking her old track to the wall, and stepping in it every time till she came to the brook. Just here a small maple not more than three inches through had blown partly across the stream—she had jumped into the top of this and crossed on the body of it. She must have had this in view all the time, as she had turned toward it when she went along first, and had not made a long leap between it and the wall, for she knew that she could not strike into a jumping track as nicely as she could into a fine trotting track. I called up the dogs, went back to the bridge down the other side, and in five minutes had her up again, but she had probably wet herself some in crossing, and in a few minutes ran into a large hurrow. I was bound to have her, so I went to a farm house and borrowed a steel trap and thought I had her sure, but she beat me then, for there was an outlet that I did not find, and she got away as she deserved to. I have not started her since, and she has deserted the hurrow.

ASHBURNHAM.

TURKMAN GREYHOUNDS.—The Jardin d'Acclimation has lately been enriched (we learn from *La Nature*) with three Turkman greyhounds of great beauty, the first specimens imported into Europe. The animals are known in the country under the name of Tazi, and are employed in catching hares, like the Sloughi in Algeria and the greyhounds in Persia. They are of noble aspect, and have great strength of muscle; their head is remarkably long and delicate in form. The hair on the body is short, but the ears (which are very large) are covered with long, silken hair. Their legs are also covered with well developed hair, and the contrast of this with the upper smooth part of the body is surprising at first sight, the dogs appearing as if they had large waving pantaloons, or reminding one of some kinds of fowl. One of the three dogs was obtained from the Kirghises of Emba, the two others at Samarkand (and by M. de Ujfalvy). We believe that it is among this breed that, as mentioned by Hamilton Smith, the *sloughi* greyhound is found so trained, that when the whole pack of them is in pursuit of a doubling hare, a stick thrown before it instantly produces a general halt, and one only is then signalled out to pursue the game.

WHAT A BEAR DOG IS.—A Montreal correspondent, who ought to know, thus defines the characteristics of a bear dog, as recognized in his section:

"It is no easy matter to furnish particulars of dogs suitable to assist in the capture of the brown bear. Such dogs, so far as I know, are of a nondescript class, laying no claim to blue blood. They should possess courage, but tempered by a considerable amount of discretion, and a becoming degree of respect for their own personal safety. This toned down, however, should not be done at the expense of vivacity. A too tenuous dog would be apt to end his career in the embrace of his bearship. A sustained and sprightly skirmishing attack in the rear generally ends in Master Bruin forming the natural conclusion that he can rid himself of all this annoyance by climbing a tree. When aloft he calmly surveys his tormentors until the rifle arrives to complete the work the dogs commenced. An approved cross is that between a foxhound and Scotch terrier, recrossed by a collie. I am sorry I cannot at present put your friend in Maine in the way of procuring such a dog.

Montreal, April 8, 1878.

CONSERVATOR.

QUITON GRASS.—A gentleman farmer's opinion on quitch grass is given boldly below:

CORNING, April 19, 1878.

EDITOR FOREST AND STREAM:

I regret to say that I have half an acre stocked with a most luxuriant crop of quitch grass. I vainly tried to eradicate it for several years, removing loads of roots each year, but it only seemed to improve the crop. Should any of your patrons desire a stock, and can't get seed, by mailing, say 25 cents for packing, in addition to postage on the amount they

require, to Jas. McKee, Jr., Edwards street, Land Co., N. Y. they will receive by return mail some nice fresh roots. Should a car-load be desired, I think it could be furnished on short notice, and on very reasonable terms. I think, however, parties would display wisdom by hunting up some other remedy for their dogs before stocking their land with this grass.

Very respectfully,
D. C. McKee.

RUPTURE IN PUPPIES.—Mr. M. P. McKoon, of Franklin, Del. Co., N. Y., the well known breeder of cocker spaniels, writes us as follows:

"I saw in the last issue of your paper inquiries as to what to do for ruptured puppies. Physic the pup and then feed on light liquid food for four or five weeks. After physicking shave the hair about the rupture and apply a sticking plaster, and in eight cases in ten the pup will get well and sound."

NED.—Ned, the property of W. H. Pierce, of Peekskill, has claims for beauty and size. Ned is out of pure Gildersleeve Flora, by One-eyed Sanchez, and is two years old. His dimensions are as follows: Height at shoulder, 23in.; from tip of nose to root of tail, 46in.; around chest, 33in.; length of head, 11in.; ears from tip to tip, 19in. In ordinary condition he weighs 13lbs.; carries a very high head and is pure white with orange and white ears and three small orange spots on body; has black eyes and nose, and is beautifully feathered; hair straight and wavy. Ned has never been exhibited in public, but is called by everyone who has seen him a remarkably fine animal.

VISITS.—*Brooklyn, March 13, 1878.*—Fisher & Bickerton's ced Irish setter bitch, Belle Mead, has visited Dr. Wm. Jarvis' champion Elcho.

Pocahontas.—**Rob Roy.**—Mr. H. H. Winslow's (Kokomo, Ind.) Pocahontas, by Rock out of Dora, visited by Mr. Burges' Champion Rob Roy, on the 12th inst.

—Chas. E. Cunningham, of Boston, claims the name of 'Marius' for his lemon and white English setter dog pup, by 'Gen. Ely's Speed out of Mr. Hardy's Daisy.

Sea and River Fishing.

FISH IN SEASON IN APRIL.

Speckled Trout—*Salmo fontinalis*. Land-locked Salmon—*Salmo gloseri*. White Perch.

FLIES FOR APRIL.

BLACK GNAT, OR MIDGE.—No. 13.—Body and feet black, wings subhyaline.

DARK CLARET GNAT.—No. 13.—Body dark claret, feet black, wings subhyaline.

BRIGHT CLARET GNAT.—No. 13.—Body bright claret, mixed with red fox face, feet ginger, wings of oose sex hyaline, the other ochreous.

GRAY GNAT.—No. 13.—Body dark fox, mixed with dark claret, feet gray, wings hyaline.

DARK FOX.—Nos. 10 or 11.—Body and feet dark fox, mixed with lemon colored mohair, wings subhyaline, tail three fibres of dark gray hackle.

POOR MAN'S FLY.—Nos. 9 and 10.—Body and feet, hare's ear and yellow mixed, wings slightly mottled gray, tail the mottle of the wood duck.

OLIVE GNAT.—No. 13.—Body dark olive, mixed with bright claret, feet ginger, wings hyaline.

RED FOX.—Nos. 10 and 11.—Body fox cub face, mixed with yellow, feet red (chicken red), wings pale gray or subhyaline, tail mottled feather wood duck.

BRIGHT FOX.—Nos. 10 and 11.—Body and feet brightest part of the fox, mixed with yellow, wings brightest hyaline, tail pale yellow.

BLACK HACKLED FLY.—Nos. 9 and 8.—Body orange, ribbed with gold tinsel, hackle black wings, tail of the American partridge.

GENERAL FLIES.

IRIS.—No. 8.—A hackle fly, ribbed with silver tinsel, body hackle, wings and tail scarlet.

PEACOCK PALMER.—No. 8.—Body peacock herl, hackle black and red mixed.

GRAY PALMER.—No. 8.—Body peacock herl, dark gray hackle.

PROFESSOR.—Nos. 8 and 9.—Body bright yellow, feet golden brown, wings wood duck and mallard, dyed yellow, mixed, tail scarlet ibis.

QUEEN OF THE WATER.—Nos. 8 and 9.—A hackled fly; body orange ribbed with gold tinsel, hackle chicken red, wings bright mottle of the mallard.

QUZZLY KING.—Nos. 8 and 9.—A hackled fly; body green, hackle dark gray, tail scarlet ibis, wings mottled feather of the pin-tail.

FISH IN MARKET.—RETAIL PRICES.—The new arrivals at Fulton Market this week have been sea bass, bluefish, weakfish and kingfish. Mackerel are very large and abundant. Shad not plentiful, those from the Connecticut River being very scarce and the prices high. The most remarkable specimen we have seen for a long time was an odd looking creature, brought in by the mackerel fishermen, who explained that it had been caught in their nets. It turned out to be a fine specimen of the tree-climbing iguana, which had been procured from a South American ship. The reptile, when we examined him, had that woe-begone, down-in-the-mouth look of the hungry tramp, far from home and in a strange land. We may in future look for weekly quotations of fresh iguana, just in from South America. Our quotations are as follows:

Striped bass, 20 cents; large do., 15; smelts, 10; blue fish, 18; frozen salmon, 25; green do., 55; mackerel, large, 15; do. small, 10; Southern shad, 30; native, 40; Connecticut River, 60; weakfish, 15; white perch, 15; Spanish mackerel, 35; green turtle, 12; halibut, 12; haddock, 0; cod fish, heads off, 0; do., heads on, 5; black-fish, large, 15; small do, 10; porgies, 15; sea bass, 20; eels, large, dressed, 18; lobsters, live, 8; do., boiled, 10; sheepheads, 20; turbot, 20; scallops, \$1.50 per gallon; soft clams, per 100, 30; do., large, 60; whitefish, 15; pickerel, 15; salmon trout, 18; Long Island brook trout, \$1; hard crabs, per 100, \$3; soft crabs, per dozen, \$1.75.

MOVEMENTS OF THE FISHING FLEET.—Receipts of halibut quite liberal; 13 Bank arrivals with 585,000 lbs. Georges fleet bring in light fares; arrivals for the week being 18, and receipts 100,000 lbs. Mackerel have put in an appearance

much earlier than usual, and the catch indicates a good supply.—*Cape Ann Advertiser, April 19.*

CONNECTICUT.—The trout season in Connecticut opened brilliantly on the 15th, and the anglers were out bright and early on the streams that brighten the iron-rusted mountains about old Salisbury. The Lakevilleans were out in full force, and there were more big fishers on More Brook than big trout to comfort them, though it is said that Dan Ashman caught 150, some weighing a half pound, and we can guess what sort of fingerlings the other sum were. Arthur W. Benson, the veteran angler from Brooklyn, was also about. Our resident artist, Sherman Pease, caught forty-two nice ones, in the upper part of More Brook, that filled his 9lb. creel, and he didn't fish but half a day at that. He reports that the brook is alive with young trout (last fall's spawning), and that the fishing was not so good for many years as now. The 10,000 land-locked salmon placed in the Twin Lakes, or streams that enter them, are as lively as griggs, and take the feed we throw to them daily like veterans, as they are bound to be.

DEVID O'SALISBURY.

RHODE ISLAND.—*Newport, April 20.*—Scrip are now taken in the bay.

A STRING OF TROUT.—If we cannot go ourselves and cast our lines in the rippling waters and catch our trout, at least our friends do not forget us. We have then to thank Mr. W. Holberton, of No. 117 Fulton st., for a dozen very handsome trout caught by him on Saturday last in Long Island waters.

ADIRONDACKS. Trout fishing is now good at the Edly, Number Four, and in Crooked Lake.

GREENWOOD LAKE ASSOCIATION.—The Greenwood Lake Association, having purchased the property of the Greenwood Lake Sportsman's Club, now possess one of the most beautiful and accessible sites for a club house in the vicinity of New York City. It proposes to erect a substantial building on the shore of the Lake for the accommodation of its members. The house is to be 40x22ft., with a kitchen and servants' quarters in the rear, and connected with the main building by a covered passage way. The club has a membership of about twenty-five, the trustees being C. Olcott, A. L. Roe and N. C. Cooke, to whom parties desiring memberships are respectfully referred.

CAMPING OUT ON BARNEGAT.—Mr. G. V. Kinsey, of the Ashland House, Barnegat, N. J., has made arrangements to provide visitors this coming fishing season with tents for camping out. When the Barnegat waters abound with bluefish Mr. Kinsey's tents will be well patroozed. The fun will begin some time in June.

Ashley House, Barnegat Inlet, April 23.—First blackfish of the season caught to-day. C. Parker took fifteen in one slack water.

PENNSYLVANIA.—*Bradford, April 20.*—Trout are very plenty here, catches of from 100 to 300 are made every day; the fish run small, few over 1 pound.

TUNA.

ANGLING ABOUT PHILADELPHIA.—The Philadelphia Sunday Post has opened a "Rod, Reel and Basket" column, which is filled with fresh, newsy and original piscatorial news. From it we learn that large chub are biting freely at Spread Eagle Station on the Bound Brook Railroad; Camden anglers catch catfish, eels and perch at Knickerbocker wharf, foot of Market street; Vine street wharf, for large catfish; Federal street wharf, in the railroad depot, catfish, eels and perch. Newton Creek, on the Haddonfield pike, is a favorite place for catching sunfish, perch and roach, the usual bait being the red worm. Fly fishermen, go to the Riffles at and below the Darby Creek dam—rockfish, perch, sunfish and chub. The fishing at Young Womanstown, mouth of Young Woman's Creek, and up the stream, is within convenient distance for the Philadelphians, and has been often extolled by us.

WHITE PERCH TAKING THE FLY.—Just now, and during the greater part of next month, the white perch (*Morone americana*) will be on their spawning beds. Along the shoals of the Delaware River, and especially in the Potomac among the rocks, which extend from Ead's Mills to Little Falls, a mile or more, are famous spawning beds, and there the finest kind of fly fishing is enjoyed in the spring. The white perch also takes the fly in early fall, although it is strictly a ground feeder and a bottom fish. It is a marine species, feeding on minnow, crab and peeler crayfish. The veteran John Krider, of Philadelphia, says:

"In reference to the white perch taking the fly: At Betterton the fishing there is in deep water, from twenty-five to thirty feet deep, and they will not rise to the fly; but along shoals of the Delaware River and sluice gates, my friends have often taken them with the fly in the months of August and September. We have been making a white fly, imitating a grub; also a red fly, which has proved very successful. The fly has also been used for chub or fall fish."

Mr. Petrie, a well-known angler in Washington, D. C., says:

"I have caught thousands of them here at the Long Bridge with a fly in imitation of a 'miller.' I make or dress them myself with a common white hen's feather, with a little white or yellow worsted for a body. About dusk and after dark is the best time. You must draw the fly slowly along the edge of the water where the fish are supposed to be. It will not do to make the fly dance on the top as for trout fishing, but just sink about an inch below the water and keep moving. I fish with three flies, but seldom get more than two fish. Hook very small, with plenty of feathers on wing."

SUSQUEHANNA SALMON.—In your reply to E. T. P., Washington, D. C., asking about species of salmon in Susquehanna at Harrisburg, you say they are the black bass. This is incorrect. They are the pike-perch or wall-eyed pike. Please make correction next week.

A. F. OLAPP.

Sptg. Ed. Sunbury Gazette.

We did not need to be informed by the editor of the Sunbury Gazette that the so-called Susquehanna salmon are the pike-perch or wall-eyed pike, though our types did say they

were the black bass. Our misprint was due to pure carelessness on the part of the writer, and he deserves a reprimand. We thank our brother editor for calling our attention to it, and we hope E. T. P., of Washington, whose address is mislaid, will note the correction. For full description of the pike-perch and its local synonyms see "Ifallock's Sportsman's Gazetteer," pages 272 and 319-23.—Ed.]

TENNESSEE.—*Columbia, April 20.*—The past week has been a lively one for anglers and fish. Eight parties have gone from here to the many trout streams, and met with success. One party went to Swan Creek, and fished for a German silver reel. The following score shows who won: Ed. Hill, 40; C. L. Gornou, 23; A. M. Hughes, Jr., 9; G. P. Webster 39; Mr. Wheat, 20; H. P. Webster, 7. The largest weighed 33lbs. A party at Lick Creek caught 60; mother, at Tennessee River caught about 200, the largest, a rattish, 18lbs., several trout, 6lbs. Mr. Horsley, editor *Herald and Mail*, was one of this party. He is a true disciple of old Isaak. A party from Mt. Pleasant, after three days' fishing on Big Bigbee, returned with 60 trout, largest, 43lbs. A garfish, weighing 16lbs. and measuring 4ft. 4in. in length, and a catfish, weighing 40lbs., were taken from a trot-line in the river here last week. A friend and myself, in two days' fishing on Buffalo Creek, returned with 55 trout and pike.

VAL.

LOUISIANA.—*Lake Charles, April 16.*—Piscatorial sports are splendid; plenty trout and other fish caught in our lake.

W. M.

MICHIGAN.—*Detroit, April 20.*—Perch fishing never better than now. Jno. Lay caught a string that weighed 39½ pounds in about four hours this morning, some of them would weigh 1½ pound each. In the morning when I come up-town I meet boys and men with poles of every imaginable shape on their way down to the copper docks.

DUNN.

OHIO.—*Painesville, April 16.*—Some bass being caught in Grant River. There would be excellent fishing were it not for unlawful pounds and nets at the mouth.

ANO.

KILBY'S CATALOGUE.—We would recommend our friends in the Provinces to send to Mr. R. H. Kilby, of Montreal, for his catalogues. These pamphlets are gotten up in excellent style (there are three of them), and they run through the whole series of sportsmen's goods. Nothing is wanting. If Canadian fishermen cannot find at Kilby's what they want they must be indeed hard to please. All cricketing implements are included in the catalogues.

ONE LUCKY PLUCKY MAN.—Mr. Chas. P. Orvis, of Manchester, Vt., says: "I never was so busy before. I have more than I can do. My San Francisco trade is far beyond my expectations. I am about enlarging my works so as to be able to fill orders more promptly. I think the FOREST AND STREAM has done much to contribute to my prosperity, for which I am very thankful."

WIND-FISH.—Several correspondents in this State have kindly replied to our inquiries for information as to what is locally known in this State as the "wind-fish," or "win-fish." It is also called a chub, but is in reality one of the *Salmonides* known as *Argyrosomus arctedi* (Gill), and nearly allied to the Oregoni. It is known popularly as the lake herring. Mr. C. Van Brunt, of Poughkeepsie, says:

"The win-fish (not wind-fish) is found in the streams emptying into the Hudson, more especially Walkill, Fishkill Creek, Wappingers, and although possessing all the characteristics of the ordinary chub of the North, they are slimmer, whiter scaled, more vigorous, frequent swift waters, and afford better sport, and are better eating than the chub proper. They rarely reach one pound in weight, although occasionally they are caught over this weight in a large stream like the Walkill. They average a few ounces. Catching this fish with a grasshopper for bait in the Fishkill Creek was the delight of my boyish days."

Mr. J. W. Griggs, of Paterson, N. J., says the fish is known as the whitefish in the northern part of that State. He does not know why it should be called "wind-fish." Never heard it so called until last summer, when he was at Ramapo River, Rockland County, N. Y., at which time he took them weighing two pounds; has heard of weighing as high as three pounds. [An extraordinary fish.—Ed.] He says:

"They rise well to a fly on a dark day, and fight very pluckily. The best fly in summer is a white moth, or any white fly. The best bait for them is called 'dough bait,' being white cotton kneaded into wheat dough. It is very tough, and very taking. These fish are sometimes taken in lakes. I caught one in Lorrill's Lake, in Orange County, last August, weighing one and a half pounds. I was fishing for black bass, and was baiting with black crickets. They bite well, also, on white grubs."

Here, also, is a very interesting letter from G. S. Van Sicklen, editor of *Flyshe and Flyshing*:

New York, March 30, 1878.

Wind-fish appears to be a local name in Orange County, N. Y. I never heard it used elsewhere, but the fish is the chub. I caught a great many ten or fifteen years ago in the headwaters of N. G. William's "Moodna" Creek, in Cornwall, when throwing a fly for trout, and it is the same old chub that grows "as big as a lamb" (as Thad. Norris, of the genial memory, said), upon the Beaverkill. In the east branch of the Delaware they call it "bass." I have caught them on various hackles, and on the coachman and Montreal fly. Probably on others grasshopper and the killing bait for them. On more than one occasion the gentlemen boarders at John Orr's, at Mountville, have kindly aided me in catching grasshoppers for the next day's fishing. The sight of half a dozen of us hopping around in the meadow in front of the house used to cause great amusement.

The right time to catch grasshoppers is before the dew is off in the morning, when you will find the pliable insect, smooth and stiff, and easily taken. Another good way is to coax a lady, with ample crinoline and white skirt, to walk over fresh cut stubble, or a new mown field, while you revolve around her and pick off the hoppers, which seem to be attracted by the whiteness. Hoppers, you know, always go for the light, and the best way to keep them, after you have caught them, is in a dredging box. Cut a square hole in the rim of the cover, and another in the top of the cup part, turn the cover till the two holes

coincide; keep your left thumb over that opening (unless you are left-handed); as fast as you catch hoppers poke them in. When you have enough, turn the cover half an inch, and you have them safe. The perforated cover gives them air. Hang the box by its handle on your creel strap, or baton it on the front of your fishing shirt. When you want a bait turn the cover again till the two holes coincide, and one of the hoppers will crawl out slowly towards the light. Seize him; turn the cover again and keep the rest alive. But a fly fisherman does not often need grasshoppers.

Those wind-fish or chub afford good sport in August, when it is too late for trout. They are more active and shy in "Moodna" than in the Delaware. I don't know why. As the hazy atmosphere of the gloaming (like a mist) enlarges to our eyes the size of objects at a distance, so the old fisherman, in the twilight of his years, looks back a long way and recalls fish of enormous size which he once caught; so I will not call upon John Orr to bear witness to the size of wind-fish I have brought to the scales at his mill to have weighed. I will tell, though, of one large basketful, seventy odd, all of good size, which I carefully cleaned on the bank of the stream and packed in mint, which happened to be handy; and how my pride at the platters full at next morning's breakfast was sorely humbled at the unexpected bitter flavor of the otherwise delicate fish. When you seek to propitiate the cook by cleaning your fish while you rest in the shade by the stream and smoke, before starting for the road to go home, do not pack them in mint.

There used to be trout in the Moodna, but when the "Newburg Short Cut" was built the natives spent their Sundays in turning the stream and its tributaries, and the trout are gone. The average catch now is one fingerling per annum, and the few owners of the land along the stream are so blind to their own interest and pleasure that they will not nudge and restock and preserve the stream. Some day they will wake up. But all this while the trout might be growing. Tell "Sportsman," of Newburg, to use a Montreal fly.

Very opportunely also, by a coincidence, comes a letter from Mr. Rowland E. Robinson, of Ferrisburgh, Vermont, making an inquiry as to the identity of a fish which we have ascertained to be the same already referred to—the *Argyrosomus arcti* of Gill. It is accompanied by an exquisite drawing, with proper specifications, etc. He writes:

FERRISBURGH, March 19, 1878.

MR. EDITOR—From what I can learn of the fishermen, they first became known about five years ago, and then, and for two or three years after, were only caught on the west side of the lake. During the past winter they have been taken on the east side, but I cannot hear of a single instance of their being caught at any other time but in winter, in any manner. So far as I can learn, they are always taken through the ice with a small hook and a very short line, say two or three feet, in sight of the angler, and biting very gingerly. The ordinary bait is a morsel of fat salt pork. The color is dark bluish on the back, becoming silvery on the sides, brightly so on the belly, with nacreous reflections on the gill covers. The scales are very easily detached. I should say that the average length was from nine to thirteen inches; the weight from $\frac{1}{2}$ of a pound to $1\frac{1}{2}$ —but this is from memory and guesswork. The ova in the specimen I examined Feb. 25 were very small, and I should think not likely to mature earlier than May. Are they a migratory fish? If so, how is it the spawn is so backward at the only time they are seen here? If not, why are they never caught at all in summer, when the lake swarms with anglers and every cove and beach is swept by seines? He is known here as "hinefish," "salmon herring," and I know not what other titles.

Prof. Gill's letter, under cover of your envelope, was duly received. Since getting it, Mr. Hall, of Vergennes, has shown me Prof. Baird's reply to his inquiry. A specimen of the fish was sent to Prof. B. He says: "It is a species of whitefish, and Mr. Miller determines it to be the *Argyrosomus clupeiformis*, a species analogous to the so-called herring of the Great Lakes." Prof. Gill names it *A. arcti*.

AWABOOS.

By a fortuitous chain of circumstances, we have in the foregoing letters much valuable information, which enables the scientist to determine very nearly the habits and habitat of the fish in our Northeastern inland waters. The *A. arcti* spawn in November. They take the fly and grub freely in winter with bait, and being a fine fish for the table, it seems that they may fill a conspicuous place among the catalogue of game fish.

PRACTICAL LESSONS ON BASS FISHING—No 2.

CHICAGO, March 18, 1878.

EDITOR FOREST AND STREAM:

I left my imaginary bass-fisher fairly launched upon the lake, but before proceeding further with him I wish to go back for a few general observations.

In the first place, don't get up in the middle of the night with the insane idea that you must be on the water at early dawn. If you do so you will lose your sleep for nothing. A bass is a very sensible fish, and prefers a late breakfast. His breakfast hour is from 8 to 11, and he rarely bites before then.

Second observation: Consult the weather; select a cloudy day if possible, but not a rainy one. However, a sunny day, with sufficient wind to make a good ripple on the water, is just as good. If the wind is high, or if there is no wind and the water is glassy, pack away your tackle and stay at home and play with the babies.

Third observation: Upon starting from home be very modest in your promises and also in your expectations. Tell your wife that it is a very bad day for fishing, that the wind is not in the right quarter. If it is cloudy tell her that bass seldom bite unless the sun shines, and *vice versa*; that if the weather changes you may get a few, but don't much expect to; that you only go for a day's rest, or to try a new rod, line or hook; or that you have got to go near the lake on business, and shall make a few casts. Your imagination will supply plenty of reasons for disarming the expectations which your previous fish stories may have excited in her mind. The beauty of this course is inimitable. If you don't bring home any fish you are all right, as she had no expectation that you would. If you or your boatmen happen to capture a good string, then you are so much ahead, and your wife will think you are a deuce of a fellow to get so many in such bad weather, and you can quietly put on a few airs. By the way, it is always safest to select a boatman who has no speaking acquaintance with your wife or friend. It sometimes saves the necessity of answering awkward questions. One more short observation. Never be guilty of taking your gun along with the idea that you can fish and shoot ducks at the same time. There won't a duck come within a mile of you, and your gun will only be an encumbrance.

And now, finally, I have to make a personal observation: I have got myself into a scrape. I have been foolish enough to read my other letter to my wife in one of my confidential moods, thinking to impose upon her an increase of respect for my attainments as a fisherman, but I missed the mark this time; when in furnishing my hero (you) an outfit, I reached the "flask of whisky," there was an explosion. It was abominable that I had put that in. If a man couldn't go fishing without drinking whisky he had better stay at home and dig potatoes, and be of some use in the world. In vain I told her that the whisky was for the boatman, and showed her that I had said so in my letter. Oh! yes; she knew all about that. The boatman! bump! much of it the "boatman" would get if you were along. Didn't you tell me that one great hearty of the boatman you had last summer was that he didn't drink? I suppose that was because you wanted it all yourself. "Now, my dear," I venture to interpose, "don't get personal; you know I never take anything along but bottled beer, and that I only take that because the water is warm and not fit to drink, and fishing on a hot day is rather warm work." "Ah, indeed! That explains why you take so much ice and so many lemons. I suppose you make lemonade out of the beer, don't you?" "Oh no; can't you understand? The ice is to keep the beer cool, and the lemons are for the boatman. He sucks them to prevent sunstroke when the hot sun is pouring down upon his head in the middle of the day." "Ah, the poor fellow! I thought you always went ashore during the heat of the day and lay round in the shade until it was over." "Well, my dear, so we do, but—I think, upon the whole, we had better drop the discussion, as I see that you don't exactly understand the circumstances of the case, as you are not a fisherman, and it would take me too long to fully enlighten you." "I don't care," said she, "I think it is too bad any way that you said anything about whisky. What a lesson to teach the boys who will read it!" I hastened to assure her that no boys ever read the FOREST AND STREAM; that they are not allowed to, as it has been found that, whenever one of them gets hold of a copy, he is sure to run away from school and go fishing or gunning the first opportunity. I affirmed, without the solemnity of an oath, that the paper was only read by great, big-bearded men, who would not be induced to drink any whisky, if they did not want it, by anything I might say, and I utterly disclaimed—and I now disclaim—any intention to champion the flask. You see I came triumphantly off, but still I confess that I am a little troubled about those "boys," and I must noise my preparation and eliminate the whisky. But how shall I get along with that boatman? I had started him off beautifully with a taste for that same flask, and it is a pity to spoil the picture. But it must be done. I have pondered long and carefully over the matter, and the best way I can see out of the difficulty is this: Don't take any whisky, but after you are clear away from home and on the lake, immediately after you have taken in your first fish, remark to the boatman, "Now we will have a drink." Feel in all your pockets; look into your lunch-basket, into your minnow bucket, under the boat thwarts, and everywhere. Express a good deal of consternation, and declare that you must have forgotten your flask—that you had it all ready and must have left it on the table in your hurry. Confound your luck a few times; declare that such a thing never happened to you before, and never shall again. Tell him you didn't care much for it yourself, but you meant to have some for him, and he may consent to be mollified. This course has its disadvantages, as it requires you to hunt up a new boatman every time you go out, and it won't take you long to exhaust the supply of new ones. However, something must be sacrificed to principle. "There, my dear, are you satisfied? I have done the fair thing by you, but you shan't read any more of my letters."

Now, I expect, Mr. Fisherman, that you begin to be impatient, and to fear that you are never to get fishing. Well, I have given you your first lesson, and one that it is necessary to learn thoroughly if you ever expect to be anything but a tyro—to wit, *patience*. "*La patience est amère, mais son fruit est doux*," and I have half a mind to make you wait another week before going fishing at all. But I won't try you further now, and will get at once down to business. Rig your tackle before getting into the boat. If you have no friend with you, place yourself in the bow, in order that you may cast ahead. If your friend is along, place him there. For this there are two excellent reasons—first, you display your generosity; and second, if he catches the most fish, of course it is understood that he ought to, as he has the best place while if you take it and fail to have the best luck, you no, only lay yourself open to the charge of selfishness, but the inference follows that your friend is the best fisherman, and altogether you will feel uncomfortable, and even become liable to express a doubt that his biggest fish weighs the conventional five pounds.

Now we are off. Don't wait to reach the best hole in the lake, but commence at once and be obtaining experience. Place your minnow upon the hook by running it upwards through both jaws. In this way he will live and swim a good while. Don't hook him in the back or belly. Reel in your line until the hook is about 18 inches from the tip of the rod. Take the rod in your right hand just behind the reel with your thumb resting lightly upon the spool to hold it. Extend the rod well back so as to give a good swing. Bring the rod to the front with an increasing velocity, and just before it comes to the direction in which you wish to cast, release your thumb from the reel and "let her spin." Hold the rod steady in that direction and let the line run until your bait strikes the water, then stop the reel quickly to prevent over running. The cast must not be made with a jerk, not too rapidly, but steadily and with just sufficient velocity to run off the line. At first it will trouble you to do this much more than you probably think. Your bait will go anywhere and everywhere except where you want it to go. Sometimes after a tremendously careful effort you will find it sticking to the blade of an oar, or the side of the boat, or it will be dangling from your companion's rod or line with which it has in some unaccountable way got mixed, or your minnow will go spinning off beautifully by itself, leaving the hook behind and leaving behind also a mad fisherman, or the devil himself will get into the reel and it will suddenly stop without apparent rhyme or reason, or it will overrun and gather back and tangle up your line in a way that will test your ability as a linguist. Continue to smile outwardly and lay the difficulty to the newness of the line, which "has not got the kinks out of it." Don't try at first to "land" your bait in any particular place. Try for general results and be happy to get it anywhere at a respectable distance from the boat. After you have attained facility in placing it seventy-five feet away, then you may venture to tell your boatman to row so that you may drop your bait "just by that lily pad over there," but don't try that the first day, nor the second. Cast with the wind: after

a few seasons' practice you may cast successfully against it. Of course famous trout fishermen of whom we read are able to laugh at the wind and hurl their flies into the teeth of a gale, but don't you try it. Well, I suppose that by this time you have pounded a half dozen minnows to death and worked yourself into a fever heat, and your mind into a fearful state of exasperation, and I am going to give you a taste of something better. The boatman has got you to where there is a bar—that word extracts a groan from me for the barred "Wicker." "Boys" won't know what that means, confound 'em, as I had intended to use it in lightening some of your woes and soothing your melancholy; and now I shan't dare to make you lose your biggest fish as I had fully determined to do, for nothing passes over that bar but water—a place where the boatman says you are "bound to strike something," and you do. There is a tug at your line. You cry out, "I've got a bite!" The boatman says "Let him have it a minute." You wait quivering as long as you can, and then you give a yank which tries the timber of your tip (I don't mean that you ought to, but you will). The fish makes a rush to one side. Your friend shouts, "Look out for him!" the boatman, "Hold him tight." You fumble around with your right hand until you get hold of the reel handle, when you reel in as though you were racing for a wager, and the fish comes right along. You think it the easiest thing in the world; he don't make much fuss until he hears the boat, when he flurries about a little. You announce however that he pulls like thunder, and must be a big one. The boatman says something which you don't understand about a "cussed snake," gets up with the landing net, tells you to "bring him up," leans over the side and takes in a two-pound pickerel. Bah! so much fuss for nothing. I need consolation myself now. Excuse me this time, my friend, and I vow that I will never voluntarily catch another pickerel even on paper. (I am going to ask the editor some time to give me space to express my love for pickerel, and if I get it I'll search the pages of the classics for language of invective, and if I fail to do the subject justice I'll throw away my pencil forever.) Kill him so that he may never bite anything again, and then throw him as far away as possible. If you are weak-headed enough to carry him home tell your wife that he is a fine specimen of muskalonge, and preserve your self-respect if you can.

I am frightened at the length of this letter, and though I know just where there lies one of the "genuine" waiting for us, we never can catch him in this letter, as it will be a matter of some time with us, and I am going to ask Mr. Editor for just one more chance. If he don't give it to me no one will ever know whether you caught that bass or not, and it will become one of the mysteries of the world. G. C.

Answers to Correspondents.

No Notice Taken of Anonymous Communications.

A number of anonymous correspondents will understand why their queries are not answered, when they read the lines at the head of his column.

J. M. H., Newark, and G. H., New York.—Blanks for entries seen you.

H. J., West Quincy, Mass.—Reliable maker, and you ought to have a good, safe gun.

W. R. N., Cleveland, G.—There is no law against trap shooting in New York State.

L. M., Concord, N. H.—For a full description of the Allegash River region, Maine, see F. and S. Sept. 23, 1875.

B. P., Pleasantville, Pa.—Inform me what length is considered best for shot-gun barrels, 12 gauge, for general use? Ans. 30 inch.

P. D. M., Nashville, Tenn.—Distemper often destroys the sense of smell in the dog to a great extent. That is possibly the trouble with your pup.

J. (?), Red Oak, Iowa.—Is there any difference in the recoil of a choke and cylinder bored gun? If so, is it noticeable? Ans. Not any appreciable difference.

O. T., Paris.—The address of G. E. Lewis, the gun and rifle maker, is 32 and 33 Lower Loveday at, Birmingham. Mr. G. E. Heming, of Paris, is his agent.

A. F., Homer, N. Y.—My puppy has an open navel, otherwise is healthy. What shall I do? Is he worth raising? Ans. Yes, worth raising. Apply a pad to the part at once.

J. A. P., Peoria, Ill.—Where can I obtain Cones' Manual of Ornithology, and price of same? Ans. Price \$2.50. Address Dr. Elliott Cones, U. S. Geographical Survey, Washington, D. C.

AWATENA, Hebron, Wis.—I send a description of a species of duck, etc. Ans. Description scarcely sufficient to be of much use, but it is probable that your bird was a Ruddy duck (*Ermisura rubida*).

G. D. R., Richmond.—In the experiments with the auxiliary barrel what was the penetration? Ans. As far as could be judged, very great, cutting through the wood placed at back of target to support it.

J. H. B., Philadelphia.—The riflemen at the Longmeadow Range Springfield, Mass., shoot directly at the target. To a person looking from a passing railroad train it would seem that they shoot at an angle.

QUILLDRIVER, Milford.—As between the — and — rifles and the old style with hammers which would you advise one to obtain? Ans. Respectfully decline answering, can only say that have just seen splendid work with the first.

W. Willow Brook.—My puppy has a lump about the size of a hickory nut at his navel and feels very soft and seems full of water, or blood. Ans. Probably the lump is a *hernia*. If so, an operation will be necessary to effect a perfect cure.

R. T. G.—The address that R. T. G., of Philadelphia, asks for in the March 28 No. of F. and S. that owns the place called the Crystal Spring Fish Farm in the Ramapo Valley, N. J., is at present 319 Battery St., San Francisco, Cal. Address B. B. Porter.

R. L. N.—I fail to find advice relative to wild rice in your columns. I should like very much to obtain some. Please advise in Correspondent's column. Ans. See last issue of FOREST AND STREAM, April 15th page 197. Cannot procure wild rice until next fall.

W. W., Washington, D. C.—Where are such springs as are used on the glass ball traps manufactured? Or where can I get one, and the probable cost? Ans. Any car or carriage spring maker in Baltimore. Price ought to be about \$1.50. The trap makers sell for \$2.

R. F., Philadelphia.—In one of my hunting excursions in Luzerne County I saw a hunter with two black woodcock. Are they a rare bird as I never saw any before? Ans. Very rare, we think, for we never heard of one before. Black woodcock are in some sections called woodcock.

A WEEKLY JOURNAL,

DEVOTED TO FIELD AND AQUATIC SPORTS, PRACTICAL NATURAL HISTORY, FISH CULTURE, THE PROTECTION OF GAME, PRESERVATION OF FORESTS, AND THE INDOOR AND OUTDOOR RECREATION OF A HEALTHY INTEREST IN OUT-DOOR RECREATION AND STUDY.

PUBLISHED BY

Forest and Stream Publishing Company.

-AT-

No. 111 (old No. 103) FULTON STREET, NEW YORK.

(Post Office Box 2332.)

TERMS, FOUR DOLLARS A YEAR, STRICTLY IN ADVANCE.

Twenty-five per cent. off for Clubs of Two or more.

Advertising Rates.

Inside pages, nonpareil type, 25 cents per line; outside page, 40 cents. Special rates for three, six and twelve months. Notices in editorial columns, 50 cents per line.

Advertisements should be sent in by Saturday of each week, if possible.

All transient advertisements must be accompanied with the money or they will not be inserted.

No advertisement or business notice of an immoral character will be received on any terms.

* Any publisher inserting our prospectus as above one time, with brief editorial notice calling attention thereto, and sending marked copy to us, will receive the FOREST AND STREAM for one year.

NEW YORK, THURSDAY, APRIL 25, 1878.

To Correspondents.

All communications whatever, intended for publication, must be accompanied with real name of the writer as a guaranty of good faith and be addressed to the FOREST AND STREAM PUBLISHING COMPANY. Names will not be published if objection be made. No anonymous communications will be regarded.

We cannot promise to return rejected manuscripts.

Secretaries of Clubs and Associations are urged to favor us with brief notes of their movements and transactions.

Nothing will be admitted to any department of the paper that may not be read with propriety in the home circle.

We cannot be responsible for dereliction of the mail service if money remitted to us is lost. NO PERSON WHATSOEVER is authorized to collect money for us unless he can show authentic credentials from one of the undersigned. We have no Philadelphia agent.

Trade supplied by American News Company.

CHARLES HALLOCK, Editor.

T. C. BANKS, Business Manager. S. H. TURRILL, Chicago, Western Manager.

CALENDAR OF EVENTS FOR THE COMING WEEK.

Friday, April 26.—Baltimore Kennel Club. Trotting at Toronto. Base ball: Utica vs. Stars, at Utica; Rochester vs. New Bedford, at New Bedford; Springfield vs. New Bedford, at Springfield; Athletic vs. Keystone, at Philadelphia.

Saturday, April 27.—Boston Bicycle Club run to Quincy. Creedmoor, Seventh Regt. R. C. match. Trotting at Toronto. Base Ball: Yale vs. New Bedford, at New Bedford; Springfield vs. Rochester, at Springfield, New Bedford vs. Worcester, at Worcester.

Monday, April 29.—Base Ball: Springfield vs. Amherst, at Amherst; Star vs. Auburn, at Auburn.

Tuesday, April 30.—Base Ball: Star vs. Auburn, at Syracuse.

STILL BLOOMING.—It seems that in Boston that guileless, bland and simple child of nature, Comanche George, still flourisheth. Sweetly murmuring "Coccatel, Coccatel," the pigeon-toed hero of many an Indian fight, dispenseth today his okra seeds for the real original Tollula, with which the Atzee maiden, when she hid the pod of the blooming flower in her dusky bosom, was fragrant, perceptibly so, for seven geographical miles. Shall we deny it? Gught we to go back on George? No, never! Touched by his beautiful fervor, smelling ourselves (in poetic fancy) a lattice decked with glorious crimson flowers, the air dyed by a thousand sweets, dreaming of bees dead drunk with the delicious odor, we did invest. May the money we paid George do him good, for the ideal Coccatel to us was worth more than the dollars we disbursed for okra seed. A correspondent in Boston, without our admiration for Comanche George's powers of Coccatellian inspiration, is down on the putative perfume-purveyor; but then there are some people of decidedly practical and prosaic proclivities. And okra doesn't make such bad soup either!

FOREST AND STREAM will be sent for fractions of a year as follows: Six months, \$2; three months, \$1. To clubs of two or more, \$3 per annum.

AUTOGRAPH LETTERS BY FRANK FORRESTER.—The following autograph letters, written by the genial and lamented Herbert, have been sent to us by Capt. R. E. Ducaigne, of Cincinnati, O., who obtained them from Mr. Heath, a Cincinnati bookseller, whose opportunities for collecting appear to have been excellent. We are under many obligations for a gift of an original. The punctuation of the original, addressed to the Editor of the *Boston Notion*, has been adhered to:

My DEAR SIR: AUGUST, . . . 1840.
I am compelled vastly against my will to take a liberty with you. In travelling I never carry with me more ready money than is actually necessary and having done so now & taken orders on Bangor I was so clever aboard the boat as to lose a twenty dollar bill—

I am a little afraid of being short before I reach my destination & in this emergency have taken the liberty of drawing on you for ten dollars at sight—for which I will account to you either pecuniarily or literally as you please—I doubt not you will pardon the liberty—Pray let me hear from you addressed to me Post office Bangor.

I am Dear Sir ever yrs

HENRY WM. HERBERT.

DEAR SIR:

NEW YORK, April 4th, 1871

Though long delayed, I write at length to redeem my promise by sending you a little piece of poetry for the *Notion*.—How the sentiments may agree with yours I hardly know—but I suppose poetry is privileged. —The only request I have to make, is that if published—it may be without any comment! If not that you will return me the MS at your earliest convenience!

I have transcribed it carefully, and do not imagine that there will be any difficulty about the printers deciphering it—May I however beg you to be very careful about the correcting of the punctuation, as the whole point of the lines depends on their running and reading fluently. I remain faithfully yours,

HENRY WM. HERBERT,

Geo. Roberts, Esq., Boston.

65 Murray st.

THE AMERICAN TEAM.—We have before this expressed our opinion most decidedly in regard to the ill-timed action of the late American team in appointing themselves their own successors. Never, do we believe, has there been a measure proposed of a more questionable character, nor likely to bring with it more disastrous effects. It smacks of self-arrogance, a good deal of conceit, with any amount of insubordination. We are quite positive that this unwise method of self-election is but a half-hearted measure, and that the wiser-thinking part of the late American team, and certainly the better riflemen, have not given their consent to this most absurd and willful action. We trust that we may before long give notice of abdication of the *vested rights* of the late American team, or, as "Nick" expresses it, "that they will step down and out." We have a very pertinent article on this subject from "Nick," which we greatly regret being obliged to defer until next week.

A SHOT THAT ECHOED ROUND THE WORLD.—Five years ago to day, the 25th of April, the first shot was fired by a rifleman over the Creedmoor range. Col. G. W. Wingate was the shooter, and Genl. Woodward acted as marker. The echo of that shot has not yet died out, nor is there any prospect of its so doing. In the semi-decade, from 1873 to 1878, the sport of rifle shooting has taken a firm hold on the American people; it has become a national pastime, and is rapidly working its way into a national duty. The single range of Creedmoor has hundreds of exemplars over the country. American rifles are acknowledged to be the best in the world, while the pages of the FOREST AND STREAM bear the brilliant record of victories won by American riflemen at home and abroad.

HONORS EASY.—The Zettler Rifle Club, of this city, has graciously conferred the honor of membership in that crack corps upon T. C. Banks, Esq., the indefatigable business manager of the FOREST AND STREAM AND ROD AND GUN consolidated journal. By the same token the Louisville Gun Club, of Louisville, Kentucky, has extended its hand of fellowship to editor Chas. Hallock, Esq., of the same journal. Thus are the unambitious made men of mark among worthy marksmen. Our acknowledgments of the honors are sincere and appreciative. May the records of these two clubs continue always to stand among the highest.

GAME PROTECTION.

MEETINGS OF STATE ASSOCIATIONS FOR 1878.

New Hampshire State Sportsmen's League, Manchester, April. New York State Association for the Protection of Fish and Game, Buffalo, May—; Secty., John B. Sago, Buffalo. Connecticut State Sportsmen's Association, Hartford, May 15. Iowa State Sportsmen's Association, Des Moines, May 28. Nebraska State Sportsmen's Association, Fremont, May 21st and 22d. National Sportsmen's Association, Wilkesbarre, Pa., June 11. Illinois State Sportsmen's Association, Quincy, June 11; Secty., Geo. E. Wheeler. The Pennsylvania State Association for the Protection of Game and Fish, Wilkesbarre, June 11; Secty., Don J. Dowanco. Ohio State Sportsmen's Association, Cincinnati, June 15; Secty., Wilbank, Toledo. Tennessee State Sportsmen's Association, Nashville, Dec. 2; Secty., Clark Pritchett, Nashville, Tenn. Wisconsin State Sportsmen's Association. Massachusetts State Sportsmen's Association, at call of President Missouri State Sportsmen's Association.

KENNEBEC ASSOCIATION FOR THE PROTECTION OF FISH AND GAME.—Dr. G. W. Martin, of Augusta, Maine, recently delivered an able address at the formation of this association, in which attention was called to the grand field of work afforded by the lake system of Maine. The total number of the lakes and more important ponds is not less than 1,503; or, including the rivers and streams, an area of 3,200 square miles—nearly half the area of the State. About 15,800 square miles is still covered with the primeval forest. To preserve the fish and game of these great fields of sport is the work proposed

by the Kennebec Association and others of similar character in the State. There is ample opportunity for much intelligent and well repaid labor here, and from the favorable inauguration of the new association we are led to await most beneficial results.

NEW YORK GAME CLUBS.—The Albany *Express* has this to say of the energetic Game Clubs of Central New York:

"There seems to be a very general determination this year among sportsmen's clubs, game constables, magistrates, and, in fact, all who realize the necessity of preserving game and fish, to enforce the laws. Good examples are set at Olay, Tully, Canastota, Goida, Cazenovia, Cayuga, Sodas, Cortland, Skaneateles, Otisco and more places in Central New York, where arrests have been made and penalties enforced. Officers who are derelict, are in some instances complained of and fined \$25 for their inactivity. The indications are that more will be done this season in enforcing the laws than has been done altogether heretofore."

GNONAGA COUNTY FISHING CLUB.—This club, which was organized in October last, has increased in membership until it now numbers over seventy, including some of the best lawyers and business men of the county. Last week the club instituted legal proceedings against seventeen illegal fishermen. Efficient service may be expected from the Syracuse gentlemen who are now in earnest in their resolution to break up the poaching.

—Game Constable Geo. M. Schwartz is making things lively for the poachers of Irondequoit Bay, N. Y.

—Ithaca has a new game protective club, called the Forest City Sportsman's Club.

WEST JERSEY GAME SOCIETY.—At the semi-annual meeting of the West Jersey Game Protective Society, held at Camden, April 17, the committee on purchasing game and fish reported that, since the first of January last, they have put into the woods, in various sections of West and South Jersey, 280 live quails and 16 guinea fowls, and have distributed in the streams and lakes 6,700 California salmon. During the past two years (not including the number above mentioned) the society have distributed this species of fish as follows: Great Egg Harbor River, 19,500; Mullica River, 19,000; Maurice River, 18,500; Tuckahoe River, 6,000; Cohansey River, 9,500; Alloway's Creek, 8,000; Mantua Creek, 6,500; Timber Creek, 3,500; Oldman's Creek, 3,500; Salem creek, 3,000; Dennis Creek, 2,500; Raccoon Creek, 1,000; Woodbury Creek, 500. The society, during the past four months, have paid a bounty of twenty-five cents each on 500 hawks killed, and also on 75 foxes; for poisoning and other expenses, \$589.55. Thirteen persons have been arrested, found guilty and punished for violating the game laws.

PROTECTION DEMANDED FOR SHAD.—It seems quite positive, notwithstanding all the services of the Fish Commissioners, that as long as indiscriminate shad fishing takes place night and day, and all the time, shad must diminish in both these rivers. How can shad reproduce their kind if they are prevented by nets from coming up the river at all? There must be a time, say one day in the week, allowed to shad, when every net should be taken out of the river.

—The pigeon slaughter about Petoskey, Mich., has been engaged in, it is estimated, by not less than 1,500 persons, including white, black and red men. Representatives of the Saginaw and the Bay City Sportsmen's Clubs went to the scene of the unlawful netting, and by the summary arrest and conviction of some of the offenders have suppressed the illegal netting.

—Rushville, Ind., is organizing a Game Protective Club.

The Rifle.

WALNUT HILL RANGE.—Boston, April 17.—The "Shot-Gun Match," at 800, 900 and 1,000 yards, fifteen rounds at each distance, winners to be determined by the averages of the best three consecutive scores. The following very tall shooting was made:

800.....5 6 4 4 4 5 5 5 4 5 6 6 6 5 5-71
900.....5 5 5 5 5 4 6 3 5 5 5 5 5 5 4-71
1,000.....5 5 5 5 5 5 5 5 4 5 5 5 5 5 6-73-216

800.....5 5 5 5 5 4 6 5 5 5 5 5 5 5 5-74
900.....4 5 5 5 5 5 5 5 5 5 5 5 5 5 5-73
1,000.....4 6 5 4 5 4 4 6 3 5 4 5 5 5 6-67-213

800.....5 6 5 5 3 6 5 5 3 3 6 5 5 5 3-67
900.....5 5 5 5 5 5 5 5 5 5 5 5 5 5 5-73
1,000.....5 3 4 4 5 5 5 5 5 5 5 5 5 5 5-67-208

800.....4 5 5 4 6 5 5 5 5 5 5 5 5 5 5-70
900.....4 5 5 5 5 5 5 5 5 5 5 5 5 5 5-71
1,000.....4 4 4 4 5 4 4 5 4 4 5 4 4 5 4-65-206

800.....5 6 4 3 4 4 5 3 3 5 5 5 5 5 5-60
900.....3 4 3 4 5 5 5 4 4 4 4 4 4 4 4-62
1,000.....4 4 4 5 5 5 5 5 4 4 4 4 4 4 4-61-189

800.....0 3 3 3 5 4 4 5 4 3 6 4 5 5 5-59
900.....0 3 4 4 5 3 3 3 5 5 4 4 4 4 4-56
1,000.....3 5 5 5 5 5 5 5 3 4 3 5 5 5 5-64-173

800.....5 4 6 5 4 5 5 5 5 5 5 5 5 5 5-73
900.....5 5 3 2 5 5 3 3 4 5 3 5 3 4 2-56-128

Mr. Shepard withdrew at the 1,000 yards range. We may remark that 215 and 213, out of a possible 225, is very tall shooting. Mr. Jackson's 74 at 800 is superb.

WALNUT HILL.—The first match last Saturday was the amateur series, open only to members of the Massachusetts Rifle Association; ten rounds at 200 yards;

H. McIlmer.....5 5 5 4 4 3 4 4 5-43
J. Wemyss, Jr.....3 4 5 4 5 3 4 4 4-43
W. E. Guerrier.....4 5 4 4 4 4 2 5 4-41
W. P. South.....3 4 4 4 5 4 4 4 4-41
E. B. Sargent, Jr.....3 5 4 4 4 4 4 4 4-40
J. N. Frye.....4 4 4 4 4 4 4 4 4-40
J. B. Parker.....5 3 4 4 5 6 4 4 4-39
H. Severance.....5 3 4 4 3 3 2 4 4-38
F. Wilde.....4 4 4 2 3 2 4 4 4-32

"No Cleaning Match," 200 and 300 yards, resulted as follows:

200 yds. 300 yds.
J. Wemyss, Jr.....3 5 4 4 4 4-38 4 4 5 4 2 4-27-55
H. Tyler.....3 5 4 4 4 4-29 3 4 4 3 3 4-25-64
Wm. Poland.....4 5 4 4 4 4-31 4 3 3 2 4 2-22-53
E. B. Sonthier.....3 4 4 4 4 4-28 3 5 4 3 4 3 0-22-50

H Mortimer.....	4 3 4 3 4 4-26	3 3 3 4 0 4-20-46
J N Frye.....	3 4 2 4 4 4-23	4 3 4 2 0 4-21-11
J B Parker.....	3 4 3 3 3 4-23	3 0 0 4 4 4-19-43

An improvised match, at 200 and 300 yards, resulted in this score:

J E Phillips.....	4 4 3 3 3-20	5 4 4 4 4-21-41
C G Wynn.....	4 3 5 3 3-20	4 4 4 4 4-20-40
A J Wynn.....	4 4 3 3 3-19	4 3 4 4 4-19-31
A T Haddenwell.....	4 3 3 3 3-19	3 3 3 3 3-16-26
H E Bellen.....	2 0 2 4 3-11	4 3 3 3 2-15-26

CONNECTICUT—*New Haven, April 22, 1878.*—A private match between J. J. Sweeney and P. G. Sanford, best two in three matches; Winchester repeating rifles:

J J Sweeney.....	4 4 4 4 4-23	P G Sanford.....	5 5 4 4 4 5-32
J J Sweeney.....	4 5 4 4 4 5-30	P G Sanford.....	4 4 3 4 4 4-27
J J Sweeney.....	4 4 4 4 4 4-28	P G Sanford.....	4 4 3 4 4 4-26
Total for Sweeney.....	50	Total for Sanford.....	45

CREEDMOOR.—On Saturday the two regular matches, one at all long and one at short range, were shot. The long-range was for the fourth Remington competition; prize, \$800 in gold. Mr. Allen made 180 out of a possible 200. At the first contest, which took place some twelve months ago, the same gentleman made 153. Conditions, 20 shots each at 900 and 1,000 yards:

	900 yards.	1,000 yards.	Total.
Isaac L. Allen.....	89	91	180
John P. Waters.....	90	89	179
L. L. Hepburn.....	90	85	175
B. G. Dougherty.....	90	84	174
C. E. Blydenburgh.....	89	85	174
L. Weber.....	87	86	173
H. Rathbone.....	90	82	172
Homer Fisher.....	86	85	171
Gen. F. F. Miller.....	89	77	157
N. D. Ward.....	74	79	153

At three o'clock the third competition for the "Skirmisher's Badge" took place. Second-class targets were used, known as the 500-yard targets. Distance covered, from 200 to 500 yards; five shots advancing and five retreating. Mr. James Ross, the winner, had on a prior occasion made 37 out of a possible 50. Following was the scores:

	Advance.	Retreat.	Total.
James Ross.....	15	10	25
A. B. Van Hensen.....	14	20	34
F. C. McLewee.....	14	16	30
C. H. Eagle.....	12	14	26
J. E. McNicol.....	15	9	24
J. L. Boutwell.....	8	14	22
J. H. Teackle.....	12	9	21
J. W. Gardner.....	3	17	20
Thomas Lloyd.....	3	19	22
W. H. Hetsler.....	4	7	11

The Seventh Regiment Rifle Club shot for various prizes. For first stage of trophy, Capt. J. L. Price made 31 out of a possible 35. For the Andrew's Diamond Badge, Mr. O. H. Eagle made 80 out of a possible 100.

CREEDMOOR, April 17.—The "Dirty Match," so called because no cleaning can be done, came off. Distance, 200 yards; 15 shots. The following were the best scores; prize, a Ballard rifle; possible 75:

J. F. Rathen.....	66	C. H. Jolr.....	57
C. G. Zeller.....	64	A. J. Howland.....	57
Frank Hyde.....	64	D. Banks.....	57
T. Rogers.....	61	Thomas Lloyd.....	60
P. McMorow.....	63	W. Robertson.....	58
J. R. Grohman.....	63	C. H. Eagle.....	59
F. H. Holton.....	63	G. H. Creed.....	58

H. Fisher.....	60	J. W. Mangam.....	49
H. W. Gray.....	59	B. Squier.....	49
J. S. Conlin.....	59	W. Haddenhorst.....	47
Charles Helzman.....	59	W. Reed.....	47
J. L. Price.....	59	J. W. Todd.....	45
E. Squier.....	59	E. A. Goater.....	44
D. E. Davies.....	53	R. E. Washington.....	44
P. L. Sheldon.....	53	James Ross.....	39
L. H. Greve.....	53	Capt. C. E. Truskow.....	37

On the same day, competition for the "Appleton Prize," the winner to have a copy of the "American Encyclopedia." Conditions, 200 and 300 yards; seven shots at each distance; possible 70:

Dr. H. S. Dudley.....	60	Homer Fisher.....	53
D. Banks.....	59	C. H. Jolr.....	52
F. H. Holton.....	58	J. L. Paulding.....	52
Theodore Rogers.....	58	A. McInnes.....	51
E. E. Lewis.....	58	W. R. Livermore.....	51
L. L. Allen.....	58	R. H. Keene.....	51
C. E. Blydenburgh.....	58	J. E. Irwin.....	50
E. H. Sanford.....	58	J. W. Mangam.....	49
E. Squier.....	57	J. S. Conlin.....	49
C. H. Eagle.....	57	J. S. Conlin.....	49
J. W. Todd.....	57	N. O'Donnell.....	48
W. Robertson.....	56	A. J. Howland.....	48
P. L. Sheldon.....	56	D. E. Vanett.....	47
E. A. Perry.....	55	Thomas Lloyd.....	47
C. G. Zeller.....	55	B. Squier.....	44
C. Helzman.....	54	C. W. Minor.....	44
J. S. Case.....	54	J. H. Grohman.....	44
G. L. Morse.....	54	J. H. Teackle.....	42
P. McMorow.....	54	C. M. Merchant.....	41
E. W. Price.....	51	N. H. Ward.....	41
J. T. B. Collins.....	54	H. W. Clemens.....	44
J. F. Davis.....	54	J. S. Gorman.....	40
J. F. Rathen.....	54	James Ross.....	39
		E. A. Goater.....	37

TELEGRAPHIC MATCH.—A match will be shot between the G. H. Thomas Post, G. A. R., of Chicago, and the New York Rifle Club. The date of the match is not yet fixed.

ZETTLER RIFLE CLUB held their weekly shooting at 207 Bowery; Creedmoor target reduced to gallery distance; ten shots per man; possible score, 50:

D. Miller.....	50	J. Du'ell.....	45
P. Feunling.....	50	J. Levy.....	45
Frederic Kilbrath.....	49	H. Oehl.....	44
M. L. Riggs.....	47	B. Zettler.....	43
M. B. Egol.....	47	M. Dorrier.....	42
C. Hudson.....	46	J. Colhane.....	42
F. Farhaus.....	46	N. D. Ward.....	41
C. G. Zeller.....	46	W. Moore.....	41
E. L. Beatese.....	45	C. Wallace.....	40

First competition of the above club for a gold medal, at Gutterburgh, Steinbruner's range, 200 yards off-hand; ring targets, ten shots per man; possible 250:

W. Klenow.....	215	F. Farhaus.....	184
P. Feunling.....	201	R. Zimmerman.....	178
N. D. Ward.....	199	J. Du'ell.....	174
M. L. Riggs.....	194	D. Miller.....	170
M. Dorrier.....	192	C. Schurman.....	161
H. Oehl.....	185	L. Beatese.....	160

SEPPENFELDT RIFLE CLUB.—175-foot range, 18-inch target, 2½-inch bull's-eye; Creedmoor rules; possible 50:

W. Seppenfeldt.....	49	Sam Dwyer.....	45
A. H. Anderson.....	48	N. W. Bach.....	41
Th. Regan.....	47	C. Roesech.....	41
Do Sullivan.....	47	E. Recker.....	41
Al Keller.....	46	E. T. Mander.....	42
Er. Koltzmann.....	45	M. Morrissey.....	42
Lease Garrison.....	45	W. Leary.....	40
Ed Story, Jr.....	45	Ch. Laing.....	41

CARLISLE (Pa.) RIFLE ASSOCIATION, April 19, 1878.—The following scores were made at 800 yards. The Carlisle Rifle Association is very young yet, this being only the fourth time they have been on their range:

Geo. D. Keller.....	5 5 2 3 4-19	Win. E. Miller.....	3 3 4 5-17
John L. Coover.....	4 3 2 0-9	A. D. Boas.....	0 0 2 2 5-9
Jim Siron.....	2 5 3 3 5-17		

SOUTH CAROLINA—*Charleston*—Our riflemen have pulled off the cover, rubbed off the oil and polished up their shooting-irons, and are again in the field after some months of quiet. The Sumpters led off with a company match on last Saturday, at their new range on the parade ground, 200 yards, off-hand, open sight, any army rifle, five shots. First prize, Company Gold Medal, won by First Lieutenant Bruns; score, 19. Second prize, Sharps Rifle, won by Captain Miller; score, 19. The average shooting was very good, considering the small amount of practicing.

Friday, 19—Carolina Battalion, Company Match, at their range, parade ground—200 yards, off-hand, open sight, six pound ball, three rounds of five shots each.—Company Gold Medal, won by P. H. Lynch, 1st round, 20; 2d, 21; 3d, 20. W. J. McCormack, second, 18, 18, 17. The average scores of the balance of the club were not as good as usual for the Carolinas, and they will have to use a little more discipline with the younger members of their team if they hope to keep their place in the first ranks of our crack shots. The Carolinas have made arrangements to have a fine shooting stand built on their range, and as a proof of their well known gallantry and of their high esteem for the fair sex, they will have a fine ball for dancing and the accommodation of their lady friends, attached to their stand. They hope to have everything completed by the 15th of next month, and will give a grand reception and shooting match at the opening of their hall.

FROGMOR.—Contest for silver prize presented by Crescent City Rifle Club; 200 yards, off-hand, military rifle:

J. Rosenberg.....	4 4 5 6-22	King, B.....	3 3 4 4 4-18
J. K. Renaud.....	4 4 5 6-22	Giffen.....	3 4 3 3 6-18
Thos. McQuibby.....	4 4 5 6-22	Coleman.....	4 5 3 3 3-18
Hestit.....	4 4 4 4-20	Parlo.....	4 2 3 4 4-17
Brown.....	4 4 4 4-20	Stevens.....	3 3 4 6 4-17
Babbitt.....	4 3 4 5-20	Dupre, H.....	4 3 2 4 4-11
Colins.....	4 3 3 4-19	Peritoux.....	4 3 2 4 4-17
Watkins.....	4 3 4 4-19	Dancer.....	4 3 3 3 3-10

The Continentals, Washington Artillery, Louisiana Field Artillery and Crescent Battalion made excellent scores at 500 yards.

TEN SHOTS AT SIXTY YARDS COVERED BY A QUARTER OF A DOLLAR.—A correspondent sends us the photograph of a target made by Mr. John F. Beaver, of Dayton, Ohio, with a Sharps rifle, .45-cal., at 60 yards. The ten shots cover a space of ¾ in., a fraction less than an inch, and every shot would have struck a silver quarter.

CALIFORNIA RIFLE ASSOCIATION.—We give herewith the scores of the spring meeting at San Bueno, April 11. The first event was the regimental team match:

First Regiment.			
Lieut. A. Robertson.....	4 4 4 4 4 4 5-42		
Capt. H. J. Burson.....	4 4 4 4 4 4 5-42		
W. P. Leeman.....	5 4 4 4 4 4 5-41		
J. Biggy.....	3 4 4 4 5 4 4-41		
O. M. Saut.....	5 4 4 4 4 4 4-41		
J. E. Kien.....	4 3 4 4 4 4 4-41		
M. A. McElhenny.....	4 4 5 4 3 4 4-40		
C. Milligan.....	4 4 4 4 3 4 4-39		
Charles P. Le Breton.....	5 3 3 4 4 4 4-38		
Corporal Duncan.....	4 3 3 4 4 4 4-38		
Second Regiment.			
E. H. Ladd.....	5 4 4 4 4 4 4-41		
John P. Warren.....	5 4 4 4 4 4 4-41		
Harry Hook.....	4 4 5 4 4 4 4-40		
F. Hageman.....	4 5 3 5 3 4 3-40		
Captain W. H. Blockhoff.....	4 4 4 4 4 4 4-39		
George H. Wood.....	4 5 3 4 4 4 3-39		
Adwin K. Luke.....	4 5 4 4 4 4 3-39		
Charles Goetzgen.....	4 4 4 3 3 4 4-38		
D. W. Swail.....	4 5 2 4 4 4 4-38		
Thomas Macanley.....	4 3 3 4 4 4 3-36		
Third Regiment.			
Lieut. J. W. Maher.....	5 4 3 5 6 4 3 5-43		
Capt. J. H. McMenomy.....	3 4 3 4 4 4 4 5-40		
A. G. Fitzpatrick.....	4 4 4 4 4 4 4 4-39		
P. Killien.....	4 5 2 4 4 4 4 4-38		
Thomas Tunstend.....	4 4 3 4 4 4 4 4-38		
T. H. J. Griffin.....	4 4 3 4 4 4 4 4-38		
John Stack.....	5 3 3 4 3 4 4 3-36		
P. O. Bourke.....	4 3 4 4 4 4 4 3-36		
Capt. D. J. Sullivan.....	4 4 3 4 2 0 5 4 3-34		
Cavalry Battalion.			
Capt. H. W. Gray.....	5 4 4 3 4 4 4 3-43		
P. W. Greany.....	4 2 4 3 3 4 3 2-42		
Lieut. M. Cook.....	4 4 4 4 4 4 3 4-40		
Lieut. P. F. McGrath.....	4 4 4 3 4 3 3 5-38		
Frank Baxton.....	4 3 4 4 3 4 3 4-34		
P. Rotherman.....	4 3 4 4 4 3 4 2-34		
Charles Salk.....	4 3 4 4 3 3 3 3-32		
Capt. M. Greany.....	4 2 4 4 4 3 4 2-30		
F. Edwards.....	4 4 4 0 5 2 4 0 2-25		
Capt. C. O. Keene.....	0 0 0 0 3 3 3 3-19		

Match for silver medal of the C. R. A., shot by best marksman in each team:

Lieut. J. W. Maher.....	4 6 5 4-22	Joshua Robertson.....	4 4 5 4-21
E. H. Ladd.....	4 6 6 4-22	Capt. Gray.....	3 4 3 4-11

Lieuts. Maher and Ladd shot off with the following result:

Lieut. J. W. Maher.....	3 5 4 6 4-21	E. H. Ladd.....	4 4 4 4-20
-------------------------	--------------	-----------------	------------

The Kellogg Challenge Cup Match, 300 yds.

J. Robertson.....	3 4 4 5-20	4 3 3 4 3-17
J. W. Maher.....	4 4 4 4-19	3 3 3 6 5-19
H. J. Burson.....	4 4 4 3-19	
P. W. Warren.....	3 4 3 4-17	4 4 2 5 3-18
C. P. Le Breton.....	4 3 3 3-17	
W. Shangknessy.....	4 3 3 3-17	4 3 1 4 5-20
J. L. Leeman.....	4 4 3 3-16	5 3 3 4 5-20
W. C. Urbau.....	3 4 3 3-16	
M. Dond.....	3 4 3 3-16	
J. Klein.....	3 4 3 3-16	4 3 2 4 3-16
P. Kahule.....	3 4 4 3-16	5 5 4 4 3-15

Pacific Life Challenge Cup contest; 200 yards:

Gen. John McComb.....	5 4 5 5-23	E. K. Lake.....	4 4 4 6-21
W. M. Farrow, of N. Y.....	5 4 5 5-23	P. Hageman.....	4 5 4 4-21
P. Kahule, Petaluma.....	5 4 5 5-23	J. S. Campbell.....	5 4 4 4-21
H. C. Smith.....	4 4 5 5-22	E. H. Ladd.....	5 4 4 5-21
Major D. W. Laird.....	4 4 5 5-22	Capt. H. J. Burson.....	1 4 4 4-20
J. E. Klein.....	4 5 4 5-22	Wm. Shaw.....	4 4 4 4-20
Serg. C. P. Le Breton.....	5 5 4 5-22		

The Ladies' Match resulted in the highest scores for:

J. E. Kien.....	1 5 5 5-21	P. Kahule, Petaluma.....	5 4 4 5-23
W. M. Farrow, of N. Y.....	5 4 5 5-23		

A CLEAN SCORE.—In a match between the Oakland and San Francisco Clubs, at Oakland, Cal., April 10, the following scores, out of a possible 30, were made:

Farrow.....	3 5 4 4 5 5 5 5 5-40
Col. Kellogg.....	3 3 5 4 5 3 1 5 5-40
Praves.....	4 5 4 4 4 4 4 4 4-40
Hanson.....	1 5 6 4 3 4 3 1 3-40
Luan.....	2 4 4 5 3 4 4 4 4-38

Mr. Farrow, of New York, then made this score with a Ballard rifle: 5 5 5 5 5 5 5 5 5-50.

SACRAMENTO PISTOL TEAM.—Weekly match, April 10. Range, 60 feet; circular target, 10½ inches in diameter, with rings counting from 1 to 11, and bull's eye, one inch in diameter, counting 12. Out of a possible 120, the following scores were made:

Byers.....	10 10 10 10 10 10 9 9 9-98
Ballard.....	10 10 10 10 9 7 10 6 8-92
Gerber, H.....	7 8 10 11 12 6 8 8 8-92
Gerber, J.....	9 9 8 8 6 12 12 10 9-91
Barren.....	12 10 10 10 7 12 10 10 9-91
Kane.....	11 11 9 7 4 11 10 10 9-91
Lofins.....	11 10 9 8 12 11 10 10 9-91

MONTANA—*Helena, April 6.*—Match for valuable prize; strong wind and rainy; 200 yards, off-hand. Score:

G. Smart.....	4 4 5 5-23	E. Ingersoll.....	3 3 3 5 4-19

O. Allen.....	5 4 4 3-20		

Programme of the Spring Meeting of the National Rifle Association of America.

CREEDMOOR, L. I., MAY 23, 24 and 25, 1878.

FIRST DAY—THURSDAY, MAY 23, 1878.

"Leech Cup" Match, 10 o'clock A. M.—Open to all native-born citizens of the United States, and all resident members of the Amateur Rifle Club, regardless of nationality. Distances, 800, 900 and 1,000 yards. Position, any, without artificial rest. Rounds, fifteen at each distance, without sighting shots. Weapon, any rifle within the rules. Entrance fee, \$1 for members of the A. R. C., and \$2 for all others. Prize—The Leech Cup, to be held by the winner during the year, and championship gold badge, value \$

Distance, first stage, 800 yards; second stage, 900 yards; third stage, 1,000 yards; position, any under the rules; weapon, any military rifle (not special military). Teams may use the rifle their organization is armed with, or any other; but all the members of each team must be armed alike. Entrance fee, \$2 per man. Prizes—To the team making the highest aggregate score, a Sharp's military rifle, model 1878, to each member. Presented by Sharp's Rifle Company. One-half the entrance money to be divided as follows: One-sixth to the team making highest score at 800 yards; two-sixths to the team making highest score at 900 yards; three-sixths to the team making highest score at 1,000 yards.

11. Subscription. Open to members N. R. A. Distance, 800 yards; position, any; weapon, any rifle.

12. Stated Prizes. Open to all comers. Distance, 800 yards; position, any; weapon, any rifle. No duplicate entries allowed.

13. Team Subscription. Open to teams of four men, as in match No. 8. Distance, 800 yards; position, any; weapon, any rifle.

14. Team Subscription. Open to teams of four men—all comers. Distance, 800 yards; position, any; weapon, any rifle.

15. Subscription. Open to members N. G. S. N. Y. Distance, 800 yards; position, any; weapon, Remington military rifle, N. Y. State model.

16. "Sharps' Military Team." Commencing at 1 o'clock P. M. Second stage. Open to teams of four men. Distance, 900 yards. Conditions, etc., as in match No. 10.

17. Subscription. Open to members N. R. A. Distance, 900 yards; position, any; weapon, any rifle.

18. Stated Prizes. Open to all comers. Distance, 900 yards; position, any; weapon, any rifle. No duplicate entries allowed.

19. Team Subscription. Open to teams of any four men—all comers. Distance, 900 yards; position, any; weapon, any rifle.

20. "Sharps' Military Team." Commencing at 3 o'clock P. M. Final stage. Open to teams of four men. Distance, 1,000 yards. Conditions, etc., as in match No. 10.

21. Subscription. Open to members N. R. A. Distance, 1,000 yards; position, any; weapon, any rifle.

22. Stated Prizes. Open to all comers. Distance, 1,000 yards; position, any; weapon, any rifle. No duplicate entries allowed.

23. Team Subscription. Open to any teams of four men—all comers. Distance, 1,000 yards; position, any; weapon, any rifle.

THIRD DAY—SATURDAY, MAY 25, 1878.—SHORT-RANGE MATCHES.

24. Directors' Match. Commencing at 9 o'clock A. M. Open only to Directors and Honorary Directors of the N. R. A. Distance, 200 yards; rounds, five; position, standing; weapon, any rifle. No duplicate entries allowed.

25. Stated Prizes. Open to all comers. Distance, 200 yards; position, standing; weapon, any rifle. No duplicate entries allowed.

26. Military Team Match. Open to teams of five from any company, troop or battery of the National Guard of New York or other States, or of the regular army, navy or marine corps, to be composed of company officers, non-commissioned officers or privates, certified to have been members of the company they represent, on March 1, 1876. Distance, 200 yards; position, standing. Teams to use the rifle their company is armed with. This match to be fired in thirty minutes. Prize—An embroidered flag, value \$100. To be won three times before becoming the property of the organization.

27. Team Subscription. Open to any team of four men representing any rifle club in the United States, or any four members of the N. R. A. Number of teams from any club or association unlimited. Distance, 200 yards; position, standing; weapon, any rifle.

28. Carbine Team Match. Open to teams of four from any troop or battery, N. G. S. N. Y. Distance, 200 yards; position, standing; weapon, Remington carbine, N. Y. State model.

29. Subscription. Open to members N. R. A. Distance, 200 yards; position, standing; weapon, any rifle.

30. Subscription. Open to members N. R. A. Distance, 200 yards; position, standing; weapon, any military rifle.

31. Subscription. Open to members N. R. A. Distance, 200 yards; position, standing; weapon, Remington military rifle, N. Y. State model.

32. Subscription. Open to all comers. Distance, 200 yards; position, standing; weapon, any military rifle.

33. Subscription. Open to members N. G. S. N. Y. Distance, 200 yards; position, standing; weapon, Remington military rifle, N. Y. State model.

34. Subscription. Open to marksmen, N. G. S. N. Y. Distance, 200 yards; position, standing; weapon, Remington military rifle, N. Y. State model. Competitors in this match must wear their "Marksmen's Badge."

35. Subscription. Open to members of the National Guard of any State, or of the regular army, navy or marine corps of the United States. Distance, 200 yards; position, standing; weapon, the authorized military arm issued at public expense to the organization of which competitor is a member.

36. Subscription. Open to members N. G. S. N. Y. Distance, 200 yards; position, standing; weapon, Remington carbine, N. Y. State model.

37. Subscription. Open to all comers. Distance, 200 yards; position, standing; weapon, any carbine.

MID-RANGE MATCHES.

38. Subscription. Commencing at 9 o'clock A. M. Open to all comers. Distance, 600 yards; position, any, with head to target; weapon, any military rifle.

39. "The National Guardsman" Match. Second stage. Open to members of the National Guard. Distance, 600 yards; position, any, with head to target; weapon, the authorized rifle in use by the organization of which the competitor is a member. Prize and conditions as in match No. 3.

40. Stated Prizes. Open to all comers. Distance, 600 yards; position, any; weapon, any rifle. No duplicate entries allowed.

41. Team Subscription. Open to any team of four men, representing any rifle club in the United States, or any four members of the N. R. A. Number of teams from any club or association unlimited. Distance, 600 yards; position, any; weapon, any rifle.

42. Team Subscription. Open to teams of four from any military organization in the United States, including the regular army, navy and marine corps. Distance, 600 yards; position, any, with head to target; weapon, the authorized

arm issued at public expense to the organization which the team represents.

43. Subscription. Open to members N. R. A. Distance, 600 yards; position, any; weapon, any rifle.

44. Subscription. Commencing at 2 o'clock P. M. Open to all comers. Distance, 500 yards; position, any, with head to target; weapon, Remington military rifle, N. Y. State model.

45. Subscription. Open to members N. G. S. N. Y. Distance, 500 yards; position, any, with head to target; weapon, Remington military rifle, N. Y. State model.

46. Subscription. Open to members N. R. A. Distance, 500 yards; position, any, with head to target; weapon, Remington military rifle, N. Y. State model.

47. Subscription. Open to all comers. Distance, 500 yards; position, any, with head to target; weapon, any military rifle.

48. Subscription. Open to members of the National Guard of any State, or of the regular army, navy or marine corps of the United States. Distance, 500 yards; position, any, with head to target; weapon, the authorized arm issued at public expense to the organization of which competitor is a member.

49. Team Subscription. Open to teams of four from any military organization in the United States, including the Regular Army, Navy, and Marine Corps. Distance, 500 yards. Position, any, with head to target. Weapon, the authorized military arm issued at public expense to the organization which the team represents.

50. Stated Prizes. Open to all comers. Distance, 500 yards. Position, any. Weapon, any rifle. (No duplicate entries allowed.)

Prize List.—Fifty per cent. of the entrance money in each Subscription Match will be divided among the competitors therein, as shall be announced in a subsequent programme.

The stated prizes in Matches Nos. 2, 18, 22, 25, 40 and 50 will be announced in a supplemental programme.

Game Bag and Gun.

GAME IN SEASON IN APRIL.

Wild ducks, geese, brant, etc.

PATENTS ISSUED IN WEEK ENDING MARCH 6, 1878.—Fire arms, nipple guard, N. Freiz, 200,999; Cartridge, G. W. Evans, 200,995; Cartridge box, J. W. Frazier (r), 3,112; Cartridge loading device, E. Schenck, 200,846.

GAME IN MARKET—RETAIL PRICES, POULTRY AND GAME.

Game—Brant geese, 1.50; mallard ducks, 75; black ducks, 75; wildgeese ducks, 50; broad bill ducks, 50; teal ducks, 50; wild geese, per piece, \$1; Wilson snipe, per doz., \$1.50; plover, \$1.50; bay birds, large, \$2.50; small, 75; wild pigeons, flights, \$1; do stall fed, \$2; Philadelphia squabs, \$3.00; wild do, \$1.

Poultry—Philadelphia and Bucks County dry picked chickens, per pound, 25 cents; do., fowls, 18; do., turkeys, 18; do. ducks, 18; State and Western chickens, 16; do., turkeys, 16; do., fowls, 12; do., ducks, 15; capons, 40; slips, 30; spring chickens, 35.

SNIPES SHOOTING.—The opening snipe shooting has not borne its usual fruits. Scarcity of birds and small bags has been the wide-spread complaint. The fact is, the present has been one of the most remarkable springs ever known. Ethereal mildness burst forth simultaneously all over the country at a very early date. Latitude and longitude lost their climatic peculiarities, and the genial breath of gentle spring breathed over all their length and breadth alike. On the third day of March the buds were swelling and the swamp maples putting forth their leaves from Canada to the far Northwest. Vegetation seemed as far advanced in Minnesota as in the latitude of New Jersey. No snow on the ground and no frost within it. The weather was so warm, in fact, that sportsmen threw off their shooting-jackets while they tramped, and the market of Chicago was well supplied with birds—the snipe—which usually come much later after a long period of blustering, chilly weather. We quite agree with a Kentucky friend when he says:

"Heretofore the snipe made regular advances forth with the season, and giving out as the weather grows warmer. This year they kept on, a few stopping here and there, and scattering themselves over a wide territory, at the same time spreading themselves instead of, as heretofore, confining themselves to a narrow belt. While the aggregate may have been as large as heretofore, the number was so scattered that large bags were impossible."

RHODE ISLAND—Newport, April 20.—Our snipe shooting has thinned out too soon; our sportsmen complain of long tramps and few wild birds. Coot shooting from the boat house, Situate and Sconnet Points, is just now in order, and the birds are flying finely for sport. It is one continual long bang from early morn to night. Mr. R. Baker, of B., made a very fine bag of coots and one wild goose in two days' shooting from the boat house point.

MURRAY HILL GUN CLUB.—A number of gentlemen met at the residence of Nicholas Engle, 12 West Twenty-seventh street, April 15, and organized the Murray Hill Gun Club. The officers are as follows: Dr. J. H. Meyer, Pres.; Fred Tracy, Vice-Pres.; Geo. Crowley, Sec. and Treas. Gentlemen wishing to become members should address the secretary, 12 West Twenty-seventh street.

LONG ISLAND—Good Ground, April 16.—The rest of the Jersey City Heights Gun Club returned to-day, taking with them twenty-six geese and some ducks. The inlet continues good, with excellent prospects of good fishing as well as sniping during the summer.

PRIZE FOR THE NEW YORK STATE ASSOCIATION.—The Messrs. Tatham have had made for the New York State Association a most elegant keg mounted on a truck, the keg to be filled with some 500 pounds of their numbers 6, 7, 8, 9 and 10 of improved chilled shot. In addition to this they also present 500 pounds more. The keg has painted on it "Harder, Heavier and more Uniform and of Brighter and Clearer Finish

than any other Shot." Here is a chance for the winner of some of the matches having his shot free for quite a number of years to come.

JERSEY CITY HEIGHTS GUN CLUB.—On Thursday, May 2, the Jersey City Heights Gun Club will have a grand glass ball tournament, when the following programme will be carried out: There will be sweepstakes, open to all amateurs; for prizes of \$100, \$50 and \$25 at single and double balls. Take the ferry foot of Desbrosses or Courtlandt streets, and go to Marion. Committee of Arrangements, Messrs. Thompson, Toffey and Eaton.

PENNSYLVANIA—Erie, April 19.—Snipe shooting very poor on account of the dry weather. Mr. O. M. Tibbals made the best bag of the season so far. Any amount of pigeon shooting a short distance from here on Philadelphia & E. R. R.—two of our crack shots bagged about one hundred dozen in the last ten days, all on the wing.

Bradford, April 20.—The gentlemen of the Tarport Oil Exchange have organized a sporting club, the "Tunungawaut Club." Many fine shots among them.

Conneautville, April 16.—Snipe-shooting good about here.

TENNESSEE—Huntingdon, April 19.—The quail season has closed here, leaving a larger number of quail to be carried over than usual. The prospect for an extensive raise the coming season is good. Snipe shooting has been very poor. This being the season for turkey gobbling our sportsmen have been quite busy in the early morn for a week or two. They repair before day to the forest where turkeys are most likely to roost, and if they halt within a half mile of a sturdy old gobbler they are certain to hear from him as gmy morn dawn in the east. Up to this writing about a half-dozen turkeys have been brought in varying in weight from 18 to 22 pounds. Our fishermen are angling in Beaver Creek, but so far with rather indifferent success.

Columbia, April 20.—Mr. H. F. Watkins, living near Summertown, Lawrence Co., about 20 miles from here, shot and killed a wild turkey weighing 29 pounds. A gentleman living near him killed one weighing 17 pounds. I am informed that "the woods are full of them."

LOUISIANA—Lake Charles, April 16.—Plovers (pepper bots) are very plentiful here now. A friend of mine, M. J. R., and I, yesterday, in three and a half hours killed fifty-one plover. Jacksnipe are making their appearance, but not plentiful yet. Marsh hens are also coming in. Many different snipe and water-fowls make their appearance here usually in the months of May and June. Partridges, ruffed grouse, etc., are nesting and protected by the game law.

TATHAM GUN CLUB.—The Tatham Gun Club was organized April 1, at Waco, Texas, and named in honor of the Messrs. Tatham of this city. The officers are: C. O. McColloch, Pres.; D. R. Ginley, Vice-Pres.; H. M. Thompson, Sec. and Treas. A shooting tournament will be held May 9 and 10, for the champion badge presented by the May Festival Association. A large number of clubs are expected to participate.

OHIO—Painesville, April 16.—A good many quail have survived in this vicinity, and their cheerful notes are heard on every hand. Snipe still scarce.

Bellevue, April 15.—Logan County includes within its limits almost a score of lakes. The country is not of low elevation. It is a part of the dividing ridge that separates the waters that flow to the Ohio from those that flow to Lake Erie. Indian Lake, the largest in the county, is now included in the Lewistown reservoir, which covers about thirteen thousand acres, and is famous for fishing and duck hunting. Silver Lake is a nice body of water, with gravelly bed, on the line of the Cleveland and Indianapolis Railroad, and is a resort for picnics and excursion parties. Rushcreek, the next lake of importance, is surrounded by an extensive swamp, which is now being ditched. Remains of various kinds of animals are being daily dug up by the workmen. Deer and elk horns are found in a good state of preservation. A set of horns have been discovered, measuring between six and seven feet from skull to tip, with numerous antlers, supposed to be remains of the moose. They were too badly decayed to be preserved. Logs are dug up with the marks of the heavers' teeth visible where they gnawed them from the tree. What a grand menagerie the animals whose remains lie deposited in this bog would make. This was the pioneer sportsman's favorite for hunting and fishing; but as the game gives way to the hunters, so they are giving way to the landlords, who forbid trespassing by gunners or anglers, and ere long the dismal Rushcreek Swamp by human ingenuity will be converted into fields of thrifty grain.

MINNESOTA—Sleepy Eye, Brown Co., April 12.—The prospect for chickens was never better, the country is full of them, and their booming in the morning makes a continuous sound like the humming of bees. Geese, brant, ducks and sand hill cranes are here in plenty, covering the grain fields and filling the sloughs. When the new lines are opened up from here this will be a prairie sportsman's paradise.

IOWA—Winteret, April 15.—Snipe are coming in quite plentifully. Our game law, as per action of the late Legislature, allows to shoot chickens only from Sept. 15 to Dec. 1. Good for the chickens, but bad for the sportsmen.

CAPTAIN BOGARDUS AT HOME.—The captain, from his home at Elkhart, Ind., writes us that, with Eugene, he is polishing off snipe and golden plover at the rate of thirty to fifty a day. This is to keep their hands in. On the 29th of April Captain Bogardus will shoot at the theatre, and then goes on to Pittsburgh to break glass balls there. The captain will be in New York during the dog show.

CANADA.—Our correspondent, Mr. J. U. Gregory, writes us from Quebec, under date of the 11th inst.:

"The first woodcock of the season was flushed on the morning of the 9th inst. by the veteran sportsman Pierre Portugais, who for thirty-eight years past claims to be the first to do so every spring. The first black duck of the season were killed at Sorel, two-thirds way between here and Montreal, on the 3d inst. by Pierre Poliquero, the man who canoed his Excellency, the late Governor of the Province of Quebec, on both occasions, when my guest last fall, duck shooting at Sorel, four black ducks and one golden-eye were sent to me and were in

Bowling Green Gun Club.

-17 | restless inventive faculties of her people. Messrs. Ba

SAN FRANCISCO YACHT CLUB.—Mr. Daniel Cook, owner of the *Tidal Wave*, has been elected a member of this club, together with several other gentlemen of the Pacific slope. The club is financially prosperous, the treasurer, Mr. Underhill, showing a balance of \$1,100 to its credit. A location for the new club-house has been chosen at Old Sacculito and a committee directed to erect a suitable structure at once. Contributing members are to be admitted to the club list hereafter. At the meeting, April 4, it was decided to have an opening cruise April 27, the fleet to make for Vallejo; low water at 2:30 p. m., and no moon, as we are informed. Just why it should be necessary to let the public know the absence of the moon does not appear. Surely it could not be that the blue ribbon element of the club has the possibility of dire disaster in view should the moon rise over the fore yard, and in selecting the particular date has made a *riuse* to do away with frequent observations of Dame Luna's altitude? Not if we know the gentlemen from the Pacific, where blue ribbon has not yet dared interfere with the strict nautical etiquette of

The well known firm of Baird, Huston & Co. have a surprising amount of work in hand at their works in Philadelphia, more particularly when the general stagnation of trade for the past few years is taken into consideration. In fact this firm is probably the busiest shipbuilding concern in the United States with the exception perhaps of the mammoth establishment of John Roach & Son, at Chester. Moreover the numerous orders the concern is now executing for foreign countries is a most encouraging sign to all who wish to see American industry take that lead in the world's manufactures which is justly due this nation's boundless resources and the restless inventive faculties of her people. Messrs. Baird,

the quarter-deck or the mariner's only companion and trust during his lonely vigil. But then perhaps there are to be fair ones accompanying the gallant tars to Valjejo, and they require protection, more so of a dark and stormy night. There is the overcoat to be shared, and there is the protecting arm of the sailor to ward off the spray from dainty figures, and there are other matters. On the whole, it is best the moon should be a little late in showing up that night.

HAVENHILL YACHT CLUB.—This club elected the following gentlemen to act as officers for the ensuing year: Commodore, E. F. Brown; Vice-Com., A. L. Reed; Fleet Capt., J. W. Dow; Sec., J. E. Collins; Treas., W. M. Dresser; Meas., Harvey Doane. Regatta Com.: L. H. Spaulding, J. E. Heath, Chas. Stacy. The pleasant spring weather has enlivened the boat owners, and preparations for the summer's sport are well under way. The first launch this season was Vice-Commodore Reed's dainty *Linnie May*, quickly followed by the sloop *Myrtle*, Foster, *Lizzie Warner*, *Captain Titcomb* and *Noctie*, owned by J. E. Heath. The *Waverley*, also launched, has been sold out of the club, much to the regret of the members, she being fast and of pretty appearance. For new yachts, Harvey Doane has nearly completed a steamer for Bernard Martin, 24 ft. in length, and has on the stocks a keel-sloop for W. M. Dresser, about 25 ft. over all. Messrs. Tuxbury and Heath are having built a C. B. sloop, 27 ft. in length, handsome model and fast lines. Much is expected of her. Secretary Collins has ready to launch a 20 ft. sloop, which some think will make up those in her class the coming season. She is deep-bodied, quite flat sided, with bilge low down, and wide V stern set low down on dead wood. There are three 18 ft. cat-rigged boats to come out this spring, which are all the new craft known to be building. Owing to the spring freshets, which are liable to continue late into the spring, no fixtures have been made yet for regattas or excursions.

WEATHER HELM.

April 15.

[From our correspondents letter it will be seen that times on the Merrimack River will be quite lively ere long.]

SLOOP YACHT MAGGIE B.—This sloop sailed for Florida, April 14, in charge of her owner, Captain Tumbridge. The *Maggie* was formerly the property of Tom Thumh, and her present owner is to sell her to Florida parties, upon his arrival, for a pilot boat. At last accounts she had reached the Delaware Breakwater windbound. She is 44 ft. on load line, and 16 ft. beam, well built and will make a handy pilot cutter for smooth waters, though her spars will require reduction for regular work. Her owner is navigating the boat himself, and holds a master's certificate in the merchant service. The *Maggie* experienced a heavy southeast gale and put into Hampton Roads under four reefs.

—In his new yacht, just launched, Mr. Pearce, of the Atlantic Yacht Club, has a handsome and able-looking affair under his feet. Her model, by Gorman, the builder, bears resemblance to the *Wave*, his last turn-out. Length over all, 46 ft.; beam, 15 ft. 3 in.; hold, 5 ft. 2 in.; length on load line, 41 ft. 5 in.; mast, 53 ft.; boom, 43 ft.; gaff, 22 ft.; bowsprit outboard, 28 ft., and topmast, 21 ft. The frame is of oak and hackmatack, yellow pine planking, galvanized iron fastenings. Centre-board, 13 ft. long; main saloon, 9 ft.; two state-rooms, W. C., pantry, and forecabin. Her dead rise is moderate, floor timbers straight, rather quick turn at the bilge, and plumb sides from the water up. Forward the hollow is slight, and kept mostly below water; aft the rim is very clear. The boat looks like a fast one.

YACHTING DRIFT.

Mr. W. J. Powell has presented to the committee in charge, as a special prize for the catamaran making best time at the New York Bay Regatta, a handsome silk pennant.....Sloop *Glance*, C. H. Read, Esq., is being overhauled at Far Rockaway.....Sloop *North Star*, formerly of New Bedford, and the handiwork, we believe, of the blind Herreshoff, has been sold to Mr. Chas. A. Stevenson.....Mr. Frank S. Towle has received his sloop *Thorne*. She is 22 ft. keel, 9 ft. beam, and 2 ft. 3 in. hold.....Farrell has in hand a racing sloop 24 ft. 10 in. long, foot of 8th street, E. R.....Captain Hunsdale has finished for Mr. T. H. Hinton, for use on Onondaga Lake, a steam launch 27 ft. long, 5 ft. 10 in. beam, 2 ft. 10 in. deep, engine 3 1/2 x 4, direct acting, inverted, high-pressure; screw 24 in. diameter. Same builder is engaged on another for Mr. W. J. Sanderson, length 30 ft. 6 in.; beam, 6 ft. 6 in.; depth, 3 ft.; engine, 5 H. P., condensing; cylinder, 4 1/2 x 5; boiler, 4 ft. long, 27 in. shell, with 9 1/2 in. tubes of brass. Hunsdale has also laid the keel for a steam yacht for Dr. F. Platte, 33 ft. long, 6 ft. beam, 3 ft. hold; double engine, cylinders, 3 1/2 x 4 in. each; propeller, 30 in. diam.....*Spitfire*, on the same lake, is having a new set of engines put in by W. J. Sanderson. D. P. Gibson, belonging to the Jersey City Yacht Club.....Sloop *Sadie* will be overhauled at Port Jefferson.

THE OAR AND PADDLE.

METROPOLITAN ASSOCIATION.—At the last meeting of the Metropolitan Association of Amateur Oarsmen, there were delegates present from the Argonauts, Atlanta, Carman Rowing Association, Columbia College Boat Club, Dauntless, Knickerbocker, Athletic, Nautilus, Neptune, Vesper and Viking, of Elizabeth, N. J. The meeting was an adjourned one from March last. It had been called for the purpose of adopting certain amendments to the constitution, and to arrange a programme of races for the next Fourth of July regatta. The following contests were fixed upon: Single sculls senior and single sculls junior; pair-oared and four-oared shells; six-oared gigs, with coxswain; eight-oared barges, with coxswain. The Regatta Committee consists of the officers of the association and the following gentlemen: A. R. Warner, of the Argonauts; L. C. Bruce, of the Knickerbockers; T. J. Goodwin, of the Columbia College Club; A. L. Souldard, of the Carman's; Gen. M. T. McMahon, W. B. Curtis, J. E. Eustice, of the Atlantas; J. P. Earle, Nereids; Mr. Van Buskirk, Mystic Boat Club; Mr. Phillips, Triton Boat Club, Newark; A. T. Shand, Neptunes, Staten Island. The Committee on Qualifications consists of General A. Shaler, Judge H. A. Gildersleeve, Commodore Dickerson, and Messrs. D. M. Judd and E. A. Buok. In view of the aspersions cast by foreigners upon the status of American amateurs, we call their attention to this very able committee, and should our English cousins choose to take the trouble to investigate the status of the gentlemen composing this committee, they will not find it a very difficult task to trace their standing in New York society, and will probably become convinced that amateurship in America is not lax, and a good deal more than a fast and loose convenience as it is in England.

UPPER HUDSON REGATTA.—This association has decided

upon June 12 and 13 for its regatta. The Laureates have withdrawn from the concern. Hereafter the finish of the course will be opposite the boat-house of the Cohoes Club. Entries close June 5, and must be addressed to the Secretary, R. R. Richards, Troy, N. Y. There will be on the first day races for fours, trial heats; second, pair-oars; third, trial heats, junior single sculls; fourth, senior singles. Second day—First, trial heats for fours; second, trial heat for junior singles; third, double sculls; fourth, final heat, junior singles; fifth, six-oared gigs.

WATKINS REGATTA.—The silly rumor that the great meeting on Seneca Lake had been abandoned has been officially denied. The races will take place as originally announced in the circulars and in FOREST AND STREAM.

SOUTH CAROLINA REGATTA.—A special meeting of the Regatta Association of South Carolina was held at Charleston, Thursday, 18th, Mr. I. P. Lesene in the chair. The following committees were appointed: Finance—Geo. D. Bryan, A. T. Smythe, I. L. Walker, R. D. More, J. B. Bissell and A. Vanderhorst. On Entertainment—C. R. Holmes, Chairman; F. W. Dawson, Sam Wragg and J. Aneram Simons. On Prizes—F. W. Dawson, chairman; A. Vanderhorst and A. T. Smyth. On Rowing—A. B. Murray, chairman; E. H. Sparkman and H. B. Bull. On Sailing—Chas. H. Glidden, A. L. Tobias and N. B. Murray. Mr. J. Aneram Simons was elected secretary. The annual regatta will take place on Thursday and Friday, May 30 and 31. On Thursday, 30th, there will be four races, the first for four-oared shells; the second, gig race; third, whitehall; fourth, boys' race. On Friday, 31st—In the morning the race for the English Challenge Cup will come off. In this race only Charleston clubs will be allowed to enter. On the same day there will be a race for first and second class yachts. It is generally regretted that the Regatta Association did not make up their programme before, as there is but a short time for the crews to train between now and the 30th, and we fear that our friends from Savannah and New Orleans, whom we expected to be with us this regatta, may not be willing to come over on such short notice. If they do come, however, they will receive a hearty welcome from the whole community in general and from their old friends, the Palmettos and Carolinas, especially. The Palmettos have the following small fleet ready for action: One four-oared shell, 41 ft. 6 in.; one single scull shell; four gigs; one Whitehall, 21 ft. One or two of the racing crews of the Palmettos have been on several times lately, are pulling well together and making good time. A splendid "First Crew" has been made up and will go to work on or about 1st of May. If they pull up to their former records, the Palmettos will hang up the champion flag for 1878 alongside of the champion flags of '73, '76 and '77, which they hold now. They also hold the Georgia Champion Flags for '73, '74 and '75, and several very handsome pieces of plate, won in various races in South Carolina, Georgia and Louisiana. The Carolinas have the following crafts on hand this season: Two four-oared shells, one cedar and one paper; two gigs and one Whitehall. We regret to hear that the Carolinas have not made up any crew, but we trust that the recent action of the Regatta Association will infuse new life into this crack club, and that by the 30th of May they will have one or two crews at least who will represent the Carolinas as well as they were represented in '74, '75, '76 and '77, and we are certain that they will not submit to having the "English Challenge Cup" wrested from them without one stroke for its defence. It is said that the Electric Boat Club intends to put one or two very strong crews afloat this season. The Electrics are keeping very quiet, but will certainly be heard from on the 30th and 31st.

YENOTS.

RUSHTON'S ROB ROY CANOES.—Mr. J. H. Rushton, of Canton, New York, writes us April 30:

"I am now building to order, for gentlemen in Louisville, Ky., two Rob Roys of the following dimensions: Length, 14 ft., width inside, 26 in.; depth between floor and deck, 13 in.; deck rise or curvature, 4 in. This gives plenty of room for sleeping; depth of keel below siding, 1 1/2 in.; water tight bulk heads about 3 ft. from ends; planking, white cedar, 3/4 in. thick; deck timbers, sawed cedars; keel and stems, oak; ribs, elm, 1 1/2 inches apart, with three broad (1 1/2 inches) ones at centre and each end of cockpit, which will be 3 ft. 6 in. x 7 in., combing bent, making round corners 3/4 in. thick, about 1 1/2 in. above deck. The deck will be 3-16th cedar, covered over with strong drilling, laid in paint and finished as coach tops and carriage work. You cannot tell it from wood when finished, and it will always be tight; mast socket as usual. I can get up such a canoe, and a real fine one, for \$75 for the boat alone, i. e., without mast, sail and fixtures. On 'rigs' I am not very well posted, and would rather sell 'boat alone.' The boat, of which Mr. Wm. Lyman, has a 'cut' in his advertisement in your columns is one of three I built for him the past winter."

J. H. R.

IS THE UPPER KENNEBEC NAVIGABLE?—Two or three weeks ago a correspondent asked us if the Kennebec was navigable from Augusta to Moosehead Lake with a portable boat? We answered, "Yes." Now there is a gentleman at Augusta, Maine, who probably knows more about the river than we do, who says it is not so navigable. He says:

"It has so much quick water as to make it necessary to 'carry' a quarter of the way. There are many rapids, a d in one place it runs so wild that no boat could stem it for five or six miles, and the banks are a perfect wilderness, and there is no 'carry,' trail or tote road. Please explain how you usually 'navigate' under such circumstances? The river is descended during high water in the spring by the river drivers in batteaux, but I should pity the poor fellow who undertook to go up, no matter how 'portable' his boat was. He had better put it on wheels and go up by horse power."

REMARKS.—We print the above because we do not wish to disappoint any of our correspondents, or get them into trouble; still, we have always found any river unavigable where logs can be driven down. We have poled up many quick headwaters where we had to work a part of our passage by lifting the canoe over shoals and carrying around falls, dams, rapids, jams, etc., and we are ready to do it again. We have been familiar with the waters of Maine and Canada for twenty years; four of them during a permanent residence. We have traversed many thousand miles in a canoe in all parts of America, and are willing to undertake to navigate the Kennebec from its outlet to its mouth in a portable boat of the proper weight, length and draft, and at a proper stage of water. The only absolutely impracticable river is one which

runs through a canyon with perpendicular walls, and a current too swift to stem with paddles, and too deep for setting-poles. Cross-logs and fallen trees are not taken into account by canoeemen.—Ed.]

CANOEING.—In our last issue we gave a list of the officers of the N. Y. Canoe Club. As the large number of canoes building of wood, and paper as well, attest the growing interest taken in this, perhaps one of the cheapest and healthiest of sports, an account of the cruises undertaken last year by the boats of the leading club will be instructive and interesting. We doubt whether in England, in spite of the vast constituency the sport there possesses, any club can show such a brilliant record of enterprise and adventure as the N. Y. C. C. scores upon the pages of its history from 1873 to 1877. Among the many trips inland and at sea we select the following: Canoe *Alice*, John Habberton, length, 15 ft., *Herald* model; cruised in 1877, in company with *Bess*, *Violetta* and *Ethel*, from Rouse's Point, N. Y., to Sorel, P. Q. Canoe *Bess*, *Herald* model, length, 17 ft., C. L. Norton; cruised in 1875, from New York to Greenport, L. I., via South Bay, with *Violetta* as far as Southampton, and *Wabrus* as far as Peconic Bay; in 1877, from Rouse's Point, N. Y., to Sorel, P. Q., with *Alice*, *Violetta* and *Ethel*. Canoe *Chip*, *Nautilus* model, length, 14 ft., J. E. Roosevelt; cruised with *Gretchen*, in 1873, from Staten Island to Rockaway and Rockville Centre, keeping even with New York steamboat for over three miles. This would give to the canoes something like a speed of twelve miles. *Chip* also sailed in 1874 from Rockaway via Cedar Island to Sayville, L. I. Canoe *Ethel*, *Nautilus* model, length 14 ft., T. H. Upton, cruised in 1876 from Newport, Vt., to Sherbrooke, P. Q., via Lake Memphremagog and the Magog Rapids, and from Wells River, Vt., to Pompanoosac, Vt., with *Violetta* and *Wabrus*. These cruises were made under her first owner, Mr. C. L. Norton. From 1877 Mr. Upton took command and cruised as before mentioned in company with *Alice*, *Bess* and *Violetta*. Canoe *Floy*, under Mr. W. L. Alden's colors in 1872, made the trip with *Wabrus* from Rouse's Point, N. Y., to Quebec, P. Q. In 1873 with *Wabrus* from Staten Island to Rockaway; in 1874 with same companion from Southampton, L. I., to Easthampton, L. I., and return. In 1875 again with her faithful mates *Wabrus* and *Bess* from Flushing, L. I., to Southampton, L. I. In 1876 with *Wabrus* and *Midge* from Newport, Vt., via Lake Memphremagog and the Magog Rapids to Sherbrooke, P. Q., and from Wells River, Vt., down the Connecticut to Pompanoosac, Vt. In 1877, with *Alice*, *Bess* and *Ethel* from Rouse's Point, N. Y., to Sorel, P. Q.; a fine showing for the *Floy* and that veteran hero of the paddle, W. L. Alden, Esq. This gentleman has transferred his recent property to Mr. T. H. Upton, of N. Y., and has had a new traveler built by Everson, of Williamsburgh, L. I. She is named the *Shadow*, *Shadow* model, length 14 ft. Concerning this new type we hope to give our readers further particulars. Canoe *Hattie*, *Nautilus* model, length 13 ft., J. M. Barnes, went in 1876, in company with *Kleine Fritz*, from Hornellsville, N. Y., via Canisteo, Chemung, Delaware and Schuylkill Rivers to Philadelphia. In 1877, from Green Camp, Ohio, via the Scioto River, to Ripley, Ohio. In 1877, same company, from Covington, Va., via James River, to Thornhill's Falls. Canoe *Lotos*, *Nautilus* model, length 15 ft. 10 in., G. L. Morse, cruised in 1872 with *Violetta* from Rouse's Point, N. Y., to Quebec, P. Q. In 1873, with *Violetta*, from Staten Island to Rockaway. In 1874, with *Violetta*, from Northampton, L. I., to Easthampton, L. I., and return. In 1875, with *Violetta* and *Bess*, from Flushing to Northampton, L. I., and with *Bess* from the latter port to Sag Harbor. In 1876, with *Violetta* and *Midge*, from Newport, Vt., to Sherbrooke, P. Q., and from Wells River via the Connecticut to Pompanoosac, Vt. Canoe *Rosalie*, *Nautilus* model, length 15 ft., E. B. Bronson, Secretary N. Y. C. C., cruised in 1876 from Harlem to New Baltimore, N. Y., with *Titania* and *Puck*. In 1877, with *Titania*, from Harlem via Hudson River, Lake Champlain, Sorel River and St. Lawrence River to Gananoque, P. Q., an extended and most interesting sail. Canoe *Titania*, also of the *Nautilus* variety, length 14 ft. 6 in., F. Sherman Smith, cruised in 1873 from Harlem to New Baltimore with *Rosalie* and *Puck* for company. In 1877, from New Baltimore to Harlem, distance 139 miles, time 39h. 50m. Again in 1877 from Harlem to Gananoque, Ont., via Hudson, Lake Champlain, St. Johns and St. Lawrence Rivers and among the Thousand Islands. The club flag is well known on New York waters, and if the zeal of the organization bears fruit in proportion to the efforts of its members, it will be known ere long on all the rivers and in all the harbors of the land. The flag is a pointed burgee, red ground and white horizontal stripe in centre.

ROWING RIPPLES.

The Columbia College Boat Club will have a benefit amateur magical entertainment at the Union League Theatre, May 8, to aid in raising funds for their European trip.....Gookin Bros., Faulkner and Reagan are the prospective professional "four" of the Hub this year.....Biglin and Frank Bellan will sit in a pair and paddle round Harlem.....Mr. M. E. Davis, of Portland, is taking some of the avoirdupois off of Plaisted, preparatory to his race with Hanlon, the lad of Toronto.....Shawmut and City Point amateurs will send sixes to Silver Lake, Boston. Kelly, the old champion of England, considers Trickett a match for any one, and is willing to lay pounds to shillings on him against Courtney. Kelly does not think much of American professionals. How about the cleaning out the Ward Brothers gave to the British professionals at Saratoga Lake? Has friend Kelly forgotten that so soon?.....Reagan, Boston's north-end pet, and Frenchy Johnson seem likely to get foul of each other. Reagan's friends want \$100 down, and a thousand more to see the thing through. It is worth that much, Frenchy. Just think of the champion of New England! How nice that sounds. Pony up, Frenchy.....The Columbia crew will leave for England May 22. Fenron has made them a boat.....Harvard boat-house contains twenty-five single sculls, eight doubles, two pairs, seventeen sixes, four eights, one burge, two Rob Roy's, three wherries and one Whitehall.....Potomac Club, of Washington, have ordered from Waters, of Troy, a new paper four.....Analostans are at work.....Silver Lake professional regatta takes place Decoration Day.....Messrs. Sage, Eldridge, Ridabock, Edson and Goodwin, the Columbia four to go to England, are in training.....Mutuals, of Albany, will row a paper boat, 40 ft. x 20 in., at Watkin's.....Nothing new from Henley yet.....Thames Rowing Association having voted not to buy the boat-house of Columbia Boat Club, Brooklyn, will build one from plans and specifications furnished by Noank parties, New London, Conn.....Captain Bancroft, Messrs. Weld and President Danforth, of Harvard Boat Club, have engaged accommodations for crew of a Mr. Lamb, on Groton side of river, near Naval Station.

Rational Pastimes.

CRICKET.—The cricket season was opened April 17, at Prospect Park, Brooklyn, with appended score, by members of the Manhattan Cricket Club:

Umpires—Messrs. Neaves and Chadwick.

Umpires—Messrs. Neeves and Chadwick.
The club will, during the season, have several matches with Paterson and Philadelphia clubs, and go to Philadelphia in July. The officers of the club for 1878 are: President, James Neeves; Vice-President, Dr Drayton; Secretary, L Love; Treasurer, S G Hosford; Managing Committee, Messrs R Hooper, B Jenkins and D L Evans. Among the players are Messrs Hosford, McDougall, Greig, Hooper, Love, Jenkins and Makin.

—The St George's have a new ground in the rear of the Knickerbocker base ball field, where they will have opportunity for daily practice. The officers are: President, Mr J T Soutter; Vice-President, George T Green; Secretary, M H Talbot; Treasurer, Berkeley Mostyn; Committee, Messrs E H Moeran, R I Crop, C Evans, A Marsh and D B Gilbert. Among the prominent players are Messrs Soutter, Moeran, Jones, Marsh, Gales, Mostyn, Talbot, Wetham and Harcombe.

—The energetic Staten Island Club players have made many improvements on their grounds, which, with the new club-house, mark a great improvement in the history of game in Richmond County. Several other games—lawn tennis, achery, quoits, etc.—are indulged in by both gentlemen and ladies, the latter having organized the Ladies' Club for Out-door Sports. The officers of the cricket club are: President, William Krebs; Vice-President, W H Clark; Secretary, W H Davidge; Treasurer, W M Betts; Directors, R B Whittemore, W M Donald, George S Schofield, Jr, M G Houghton and P F Kobbie. Among the principal players are Messrs J R Moore, Davidge, Donald, Davis, Duer, Eyre, Houghton, Roberts and Jarvis.

MERION CRICKET CLUB.—This club, of Philadelphia, now in its thirteenth year, opened the present season at the club grounds at Ardmore, last Saturday, with a game between the first eleven and twenty-two. The club has a list of one hundred and twenty-six members, and twenty-one junior members. The officers are: Pres., Jas. Rawle; Vice-Pres., J. R. Williams; Sec., Ed. S. Sayres, Jr., 217 South Third street, Phila.; Treas., W. M. Montgomery.

THE CHAMPIONSHIP WALK.—The conditions of the walking match at the Rink, this city, May 10 and 11, have been changed by the re-sending of the stipulation that 110 miles must be covered in order to win the medal. It will be given to the athlete walking the greatest number of miles in twenty-four hours. A special track is to be laid down for the amateurs. The division of the professional prizes will be as follows: The winner will take the belt and \$300, the second man \$100, and the third \$50; \$25 will be given to the man who beats the American record at 50 miles, and \$25 to the pedestrian who beats the American record at 100 miles. All communications must be addressed to Edward Plummer, 9 Murray street.

WHEELING A BARROW.—R. L. Potter started out from Albany, April 10, to wheel a barrow from that city to San Francisco. This feat, if performed within 250 days, is to be rewarded with a purse of \$1,000. The wheeler must make his 16 miles each day, Sundays excepted. This is another item for our proposed department of Irrational Pastimes.

NEW YORK ATHLETIC CLUB.—The programme for the spring meeting of the club, May 30, includes the following games: 100, 220 and 440 yards, half-mile and one-mile run, three-mile walk, 120 yard hurdle race, shot putting, hammer throwing, pole leaping, running high and running broad jumps, tug of war, open to teams of five men from any athletic club or organization, with the following handicaps: 125 yards run, 250 yards run, 600 yards run, fifth of a mile hurdle race (2½ feet hurdles) and one-mile walk. Entries close May 20.

BOSTON BICYCLE CLUB.—The club assembled on Boylston street, at 3 p. m., Saturday, with eleven bicycles in line, Captain Frank Weston in command. A run was made to Newton via Beacon street and return. Time, about eight miles per hour.

INTER-COLLEGIATE ATHLETICS.—At the convention held in this city April 20, delegates were present from Columbia College, Lehigh University, New York College, Princeton, Rutgers and Union Colleges, and the University of Pennsylvania. H G Maynard, of Princeton College, was elected president for the ensuing year; W J McNulty, of Union College, Vice-President; E S McIlvane, of the University of Pennsylvania, Secretary; William Waller, of Columbia College, Treasurer; J W Pryor, of Columbia, H F J Porter of Lehigh University, and H Marquand compose the Executive Committee for the ensuing year. The spring contests will be held on the 18th of May, on the track of the New York Athletic Club at Mott Haven, with the following list of events: For undergraduates—One-mile walk, two-mile walk, 100 yards dash, quarter-mile run, half-mile run, 220 yard dash, one-mile run, hurdle race, running high jump, running broad jump, pole vaulting, putting shot, throwing hammer, standing high jump. For graduates—a 100 yard dash and one-mile walk.

PEDESTRIANISM AT BOSTON.—The walking matches held under the auspices of the North End Athletic Club, closed last Saturday evening. James Hughes walked six miles in 55m 44s. A three-mile walk was made by Hallett in 25m 17s; Merrill, 27m 38s; and Higgins, 28m 50s. Mile run: J Kelly, 5m 52s; Leighton, 5m 55s; Frisbee, 5m 59s; and Farrer, 6m 35s. Mile run for professionals: Lawrence Agnew, 5m 51s.

—The pedestrian Fisher, of Louisville, Ky., made fifty miles in 9h 13m.

C. O. D. FISH.—That spells codfish, but they were catfish, and according to the veracious account of the *New Orleans Times* there were 1,523, the modest catch of one and one-half hours' angling, by four anglers, near that city. The result of this performance, we are told, was "an unprecedented depression in the fish market, the price of selected 'cat' with mashed bones, being quoted at half a cent a pound, with little inquiry and few speculators at that figure. Many of our citizens have been the recipients of strings of this delicious fish, sent by express, marked 'speckled trout, C. O. D.,' and generally sent back with regret, on account of not understanding the initials. Altogether the trip was not a success; to quote the emphatic language of Colonel Jack Sellers, they didn't leave enough catfish around Lookout Station to start another generation."

—Teacher with Reading Class: Boy (reading).—"And as she sailed down the river—" Teacher—"Why are ships called she?" Boy (precoziously alive to the responsibilities of his sex).—"Because they need men to manage them."

Tiffany & Co., Silversmiths, Jewellers, and Importers, have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they prepare special designs for similar purposes. Their **TIMING WATCHES** are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. **TIFFANY & CO.** are also the agents in America for Messrs. **PATEK, PHILIPPE & CO.**, of Geneva, of whose celebrated watches they have a full line. Their stock of Diamonds and other Precious Stones, General Jewelry, Artistic Bronzes and Pottery, Electro-Plate and Sterling Silverware for Household use, fine Stationery and Bric-a-brac, is the largest in the world, and the public are invited to visit their establishment without feeling the slightest obligation to purchase. **UNION SQUARE, NEW YORK**

Musical Instruments.

HIGHEST HONORS

AT THE
Centennial World's Fair, 1876!

SHONINGER ORGAN

PRONOUNCED UNANIMOUSLY AS THE
Best Instruments.

Their comparative excellence is recognized by the Judges in their Report, from which the following is an extract:

"The B. SHONINGER ORGAN CO.'S exhibit as the best instruments at a price rendering them possible to a large class of purchasers, having a combination of Reeds and Belts, producing novel and pleasing effects, containing many desirable improvements, will stand longer in dry or damp climate, are liable to get out of order, all the boards being made three-ply, put together so it is impossible for them to either shrink, swell or split." THE ONLY ORGANS AWARDED THIS RANK.

There are 50,000 of our instruments in this and the European countries in use, and they are so made that they will keep in tune, and stand any climate. They contain a magnificent Chime of Bells, tuned in perfect harmony with the Reeds, producing wonderful effects. The Music Rack, when tuned forward, will make a splendid writing desk, with our Book Closets and Swinging Lamp or Flower Brackets, with a fine stool boxed free with each Organ, makes the SHONINGER ORGANS the most substantial, convenient and perfect Organ.

The Gun of the Future.

Samples of the Hammerless Gun now on exhibition, and orders taken by our agent. Guns to be delivered June 1.

See the Following Testimonials:

SIR—It is a pleasure for me to inform you of my high appreciation of the 10-lb. Greener breech-loader purchased of you last winter. I consider choke-boring, if skillfully done, as the greatest improvement in fowling pieces since the introduction of the percussion cap. It gives the maker complete control of the pattern, and greatly increases penetration. To prove this, I will give you the performance of this gun. The 32-inch 10-gauge barreled, charged with 4½ drachms of powder and 1¼ oz. No. 6 shot, 114 chilled shot, give patterns ranging from 25 to 330 pellets in 30-inch circle at 40 yards. The same charge of powder and 1¼ oz. No. 4 American shot gives 180 to 175 pattern, with penetration which kills ducks at 60 to 70 yards like a stroke of lightning. It is a characteristic of the choke-bore to show its greatest superiority in the large sized shot. What I am about to say will perhaps surprise you as much as the performance surprised me. On trial of the 12-gauge 28-inch modified choke-bore barreled, with 8½ drachms of powder and 1¼ oz. of shot, I got about the same pattern and spread of shot at 25 yards as with the full choke 10-gauge barreled at 40 yards, with tremendous penetration. This is just the performance required of a gun for thick cover, in which you generally find ruffed grouse, woodcock and quail, these birds being killed, with few exceptions, at from 15 to 24 yards.

A SPECIALTY.

AGENTS

FOR THE FOLLOWING CELEBRATED MAKERS
W. & O. Scott & Sons (winners at the International Gun Trial of 1878); J. P. Clabough & Bro.; P. Webber & Sons, and Westley Richards.
Thomson's Hunting Suits and Oil Finished Grain Leather Shoe Packs.
Dillon & Bawkesley's Shooting Tackle.
Barnes' Patent Brass Shot Shells.
Bassett's Patent Gyro Pigeon and Trap, with case and 100 birds

Black's Patent Cartridge Vest.

This Vest affords the best arrangement yet invented for carrying cartridges. The weight is so evenly distributed that it is scarcely felt. Cartridges can be carried with the heads down in this vest, which is of great importance when brass shells are used, as when carrying them with the head up the weight of the shot often forces the wad forward, when bad shooting is the result. In ordering send measurement round the chest. PRICE \$1.50.

AGENTS FOR THE UNION METALLIC CARTRIDGE CO.'S AMMUNITION.
Warranted the Best in the Market.

76 Shooting Coat.

The largest assortment of SHOOTING GARMENTS in the World.

Illustrated price list will be sent to any address on letter of request.

CEO. C. HENNING,
WASHINGTON CITY.

Painting.

PAINTING.

EVERY ONE THEIR OWN PAINTER.

50 Per Cent. Saved.

We are manufacturing a very fine Pure Ready-mixed Paint, mixed in such a manner that any ordinary stable or farm hand can make as good a job painting as a painter can with paint mixed in the old way. This is because our paint does not set quick, and thus shows marks of the brush. We sell it lower than materials can be bought in the ordinary way, and pay freight in certain sized orders.

Any gentleman wishing to paint up his buildings at a small expense had better write, and have sent free our book.

Address 260 Front street,

INGERSOLL PAINT WORKS.

Animal Portraiture.
Gentlemen desirous of having their Horses and Dogs painted will be guaranteed an authentic and perfect likeness. Reference to editor of this paper.

COCKER SPANIEL

Breeding Kennel

M. P. MCKOON, Franklin, Del. Co., N. Y.

I keep only cockers of the finest strains. I sell only young stock. I guarantee satisfaction and safe delivery to every customer. These beautiful and intelligent dogs cannot be beaten for ruffed grouse and woodcock shooting and retrieving.

SPIKE COLLARS.—Spike Collars, by means of which dogs of ANY AGE OR BREED, no matter how long hunted, or what the disposition, can be taught to fetch and carry, and to retrieve game in a most perfect manner, with no play about it. Dogs broken of gun-shyness and whip-shyness, made steady before and behind, and "heel" steadily; prevents lagging on the chain, besides a much more extended sphere of usefulness. Price, with directions for making, \$3. Kennel collars, which no dog can get over his head, price \$1. Address M. VON CULIN, Delaware City, Del.

THE DOG BREAKER'S GUIDE.—Train your own dogs in the most artistic manner. "The Dog Breaker's Guide" sent for three cent stamp. M. VON CULIN, Delaware City, Del.

FOR SALE.—One Irish Gordon setter pup, seven months old; pedigree given; price \$25. Address H. S. LA VANE, New Dorp, Rich. County, N. Y.

FOR SALE.—A dark red Irish setter pup, whelped Aug. 24, 1877, by Melly's imported York, out of Bess (Salter's Dash, Strachan's Belle). Address E. C. SMITH, Bolton's Hotel, Harrisburg, Pa.

FOR SALE.—Being crowded for room we wish to dispose of some of the following: Franklin, imported English setter; Spottedwood, fine pointer; Gup, fine pointer, bitch pup; Dash, imported Irish setter, winner of second at Boston. For prices, etc., address LINCOLN & HELLAR, Warren, Mass.

FOR SALE.—Red Irish setter pups, sired by the late celebrated Robinson's "Jack" out of "Rhoda," who was sired by Hamilton Thompson's champion "Duke" and out of "Bess." "Rhoda" is a half-sister to "Duke Jr.," who won first prize at last New York Bench Show. JOS. BAGOT, 200 8th street, South Brooklyn, L. I.

THE NEW SCALE OF FOINTS.—Compiled from Stonehenge's new edition of "Dogs of the British Islands," and adapted by the Westminster Kennel Club to be used at the dog shows in New York. Sent prepaid on receipt of price, 50 cents, by "The Country Publishing Association," No. 33 Murray street, New York.

\$25 will buy a broken orange and white setter bitch, with pedigree for forty years, or \$12 an orange and white dog, three months old. Address E. J. ROBBINS, Whethersfield, Conn.

PURE MASTIFF PUPS. got by Robert L. Belknap's prize dog, Fintin, for sale, cheap. Address N. BOGUE, Batavia, N. Y.

MARYLAND POINTERS IN THE STUD.

"PONTO."

Liver color, weighs about 57 lbs.; is a first-class field dog both on covers and single birds; has great speed and endurance, and is not afraid of briars. Was shown at Baltimore in the same class as Sensation, and was highly commended.

"BRAGG."

Lemon and white, weighs about 60 lbs.; litter brother to TUI, who took first premium for Native Pointers at New York, May, 1877.

Fee for Either Dog, \$20.

As regards performances of dogs in the field, would refer to Messrs. Clark & Snelder, Baltimore; Hon. J. E. Reynard, 1,822 Spring Garden street, Philadelphia.

FOR SALE.—One liver-colored pup, by Ponto, out of Oinger, whelped in August, 1877. Price for pup, \$25. Also, five dog and four bitch pups, whelped April 1, 1878, by Ponto, out of Oinger. Price, \$15, at eight weeks old, or \$20 per pair. Address MULLIKIRK KENNEL, Mullirk, Prince George's County, Md.

FOR SALE.—Setter pups, orange and white, well bred and handsome; dogs, \$10; pups, \$5; also, a cocker spaniel pup, of good stock, \$9. Address E. SHERMAN PEASE, Canaan, Conn.

FOR SALE.—One Fox patent \$10 gun; laminated steel barrel; rebounding locks; pistol grip; weight 9 lbs., \$60. In fine order, one very fine Weitz Richards, in oak case, complete; 12 gauge, 30-inch barrel, 7 lbs. Either pin or central fire; in perfect order. Price \$140. Cost \$250. W. HOLBERTON & CO., 117 Fulton street, N. Y.

FOR SALE.—Whelps sired by "Carlowitz," dam "Fintin," by "Salters' Dash" out of "Bonnet Carre." Also fine bred setters, registered Jersey cattle and game fowl. CHARLES DENISON, Hartford, Conn.

ENGLISH PRIZE, STUD, SPORTING AND NON-Sporting Dogs for sale. Greyhounds, pointers, setters, retrievers, spaniels, broke for the field, \$20 each; for the field and bench, of good pedigree, \$40 each; fox terriers, bull terriers, black and tan terriers, from \$10 each, all dead game, of good pedigree, and very valuable for breeding; better quality for the show bench, \$20 each. Also a few Yorkshire terriers, at \$10 each. The prize Yorkshire terrier, "Willie," will be sold. Winners of silver cup, Queensbury, first and silver cup Liverpool, and ten other prizes. All dogs will be sent to Messrs. Bampton & Stegall, Express Agents, 60 William street, New York. Drafts to accompany order, payable on Alliance Bank, London. Satisfaction is guaranteed by the advertiser, who is a judge and reporter of English dog shows. F. STEEL, Well Royd Farm, Stamp Cross, Halifax, England.

FOR SALE.—One fine rabbit hound, one year old; one good fox hound, been run one season; one pair red Irish setter pups; one red Irish dog eleven months old, well house-broken; a good retriever; one black and white native setter, well house-broken, drops to shot and is very staunch, will make an extra fine dog; one native setter three years old, been worked on partridge, quail, and woodcock, will sell any of the above at a low figure. Dogs boarded and broken. For any information address H. T. DAVIS, South Weathersfield, Ct.

For Sale.

Black Rock, Scarborough, Me., For Sale.

The house is roughly finished, has eight sleeping rooms, and is located a half mile from Pine Point Station, B. & M. R. R., 2 1/2 miles from Oak Hill Station. E. H. R. Boating, fishing, bathing and shooting. Flowers, ducks, snipe, etc., on the famous Scarborough Marshes. Fine sea-fowl shooting in autumn, winter and spring. Woodcock covers within a few miles. This place has a commanding view, and is desirable for a summer resort or residence, or for a small club of sportsmen. An unusually favorable locality for raising fowl. Sept 17 17

Wanted.**Decoy Ponds.**

A gentleman will be happy to enter into correspondence with any party with the view of establishing Decoy Ponds for taking wild waterfowl in large quantities, having had great experience in England, where he was very successful. The thousands of wild ducks that resort in winter to some of the Southern States can be made a source of great wealth at very moderate expense. The price of wild fowl in both the English and American market will justify any one entering into the enterprise. Address E. C. D., New Glasgow, Nova Scotia.

apr 16 31

WANTED—One hundred fresh prairie chickens; at least one-half warranted to hatch. Apply, stating price and particulars, to RAMON, this office.

apr 11 41

Gunpowder.

**THE
HAZARD POWDER CO.,
MANUFACTURERS OF
GUNPOWDER,**

Hazard's "Electric Powder."

Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square casks of 1 lb. only.

Hazard's "American Sporting."

Nos. 1 (fine) to 6 (coarse). In 1 lb. casks and 6 1/2 lb. kegs. A fine grain, quick and clean, for upland prairie shooting. Well adapted to shot-guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 5 (coarse). In 1 and 5 lb. casks and 6 1/2 lb. kegs. Burns slowly and very clean, shooting remarkably close and with great penetration. For field, forest or water shooting, it ranks any other brand, and it is equally serviceable for muzzle or breech-loaders.

Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting" FG, in kegs of 25, 12 1/2, and 6 1/2 lbs. and casks of 5 lbs. FFG is also packed in 1 and 1/2 lb. casks. Burns strong and moist. The FFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard Rifle powder of the country.

Superior Mining and Blasting Powder.
GOVERNMENT CANNON & MUSKET POWDER;
ALSO, SPECIAL GRADES FOR EXPORT, OF
ANY REQUIRED GRAIN OR PROOF, MANU-
FACTURED TO ORDER.

The above can be had of dealers, or of the Company's Agents in every prominent city, or wholesale at our office.

65 WALL STREET, NEW YORK.

Laflin & Rand Powder Co.

No. 20 MURRAY ST., N. Y.

Sole Proprietors and Manufacturers of
Orange Lightning Powder.

No. 1 to 7, strongest and Cleanest made, in sealed 1 lb. casks. Higher numbers especially are recommended for breech-loading guns.

Orange Ducking Powder,

For water-fowl, strong and clean. No. 1 to 5 in metal kegs, 6 1/2 lbs. each, and casks of 1 and 5 lbs. each.

Orange Rifle Powder.

The best for rifles and all ordinary purposes. Sizes, FG, FFG and FFGG, the last being the finest. Packed in wood and metal kegs of 25 lbs., 12 1/2 lbs. and 6 1/2 lbs., and in casks of 1 lb. and 1/2 lb. All of the above give high velocities and less residue than any other brands made, and are recommended and used by Capt. A. H. BOGARDUS, the "Champion Wing Shot of the World."

**BLASTING POWDER AND ELECTRICAL BLAST-
ING APPARATUS. MILITARY POWDER**
of all kinds on hand and made to order.
Safety Fuse, Frictional and
Platinum Fuses.

Especially Adapted for Target Practice.
SPLENDID FOR SHOOTING SMALL GAME and touchlog up
CATS OR DOGS.
Just the thing for Taxidermists to collect specimens. There is no report or dan-
ger attending its use, or any auxiliaries required to operate it. It can be loaded with
ease and rapidly. It is extremely simple, and has no delicate parts to get out of order or wear
out. For sale by the Trade generally. Sent upon receipt of price or C. O. D.
SEND FOR CIRCULAR.

H. M. QUACKENBUSH, Patentee and Mfr, Herkimer, N. Y.

**Hart's Sportsman's Favorite Metallic Shells.
FOR BREECH-LOADING SHOT GUNS.**

These Shells are easily loaded, and the caps easily extracted from inside. Head solid and much thicker than any Shell now made, giving a solid seat for cone or anvil, which prevents it from driving through or springing away, thereby causing miss-fires. The Cone is made of nickel, and fast-
tened solid in its place. Neither rusts nor corrodes fast, like movable anvil made from steel. The Nickel
Cone also prevents miss-fire when a cap has been left on shell for a few days, which is liable to occur either
in steel or iron. These Shells are finely finished, and made any length ordered, from 2 1/2 to 3 1/2 inches.
Shells and Loaders and Descriptive Price-Lists can be obtained from all the leading Sportsmen's Houses
throughout the country.

FROM CAPTAIN BOGARDUS, CHAMPION WING-SHOT OF AMERICA.

MESSRS. GEORGE E. HART & Co.—Gentlemen: The fifty Shells I received from you to-day suit me better
than any I have ever used. They are stronger and better in every respect, and I shall use them in all my
shooting hereafter.

Yours truly,

A. H. BOGARDUS.

SHARPS' RIFLES---MODEL 1878.

Parties wishing to procure one or more of the above make of Rods can do so by applying in person or
by letter to

RICHARD NORRIS, 2,550 Gray's Ferry Road, Philadelphia

Comprising four Salmon Rods, two Trunk Rods (Trout), thirty Trout Rods of Split Bamboo, Lance
and Iron Wood and Greenheart, with extra tips of split bamboo and extra middle joints. Some of the
above in Red Cedar cases; a convenient form of carrying them to prevent injury to the tips.
Any information in regard to the above will be furnished on application to the above address
April 4 41

Auxiliary Rifle.

SHELTON'S Auxiliary Rifle Barrel for Breech-Loading Shot-Guns.

This barrel can be placed in a gun ready for use in a second of time with the same ease as a cartridge, and
can be removed just as expeditiously. There is no wear on the rifle barrel, not on the shot-gun, and it can-
not get out of order. With this Auxiliary Barrel, which weighs about one pound, almost instantly
a breech-loading shot-gun can be converted into a most accurate rifle. The AUXILIARY BARREL will
fit any standard make of gun of 10 or 12-calibre—calibre of rifle 32, 38, or 44, as desired. Length of
barrel, twenty inches. Any central-fire metallic cartridge can be used. Also, the EVERLASTING SHELL
or shells can be loaded by the person using the rifle. Send for a Circular and Price List.

FLYING TARGET.

(Patented August 7, 1877, No. 193,570.)

The way it came to pass was this: I to a sporting
club belong; I love to shoot; I love to see the long-
bill tottling to the cone from whence 'twas flung,
or in its whirling flight the goodly grouse come
duttering to the ground, and hence to make myself
proficient in the noble sport, I joined the club, and
practised at the gyro, glass ball, and the living bird,
and as a substitute thereof the CHEAPEST and the
BEST, the Flying Target, I've contrived. For in-
formation, if you wish, or for a trap, address

"THE FISHING LINE."

Brook Trout, Grayling and Black Bass Fisheries
 of Northern Michigan,

VIA THE

Grand Rapids & Indiana RR

(Mackinaw, Grand Rapids & Cincinnati Short Line.)

Sportsmen who have cast a fly, or trolled a spoon
 in the

Grand Traverse Region

will come again without solicitation. All other lovers
 of the Rod are invited to try these waters, wherein
 the fish named above, as also Muscalonge, Pike and
 Pickerel abound.

In no other streams east of the Rocky Mountains
 is the famous AMERICAN GRAYLING found in
 such numbers.

BROOK TROUT Season opens May 1.
 GRAYLING Season opens June 1.

The Sportsman can readily send trophies of his
 skill to his friends or "Club" at home, as ice for
 packing fish can be had at many points.

TAKE YOUR FAMILY WITH YOU. The scenery of
 the North Woods and Lakes is very beautiful.
 The air is pure, dry and bracing. The climate is
 peculiarly beneficial to those suffering with

Hay Fever and Asthma.

The Hotel accommodations are good, far surpass-
 ing the average in countries new enough to afford
 the finest of fishing.

On and after June 1 Round Trip Excursion Tickets
 sold to Points in Grand Traverse Region, and attrac-
 tive train facilities offered to tourists and sportsmen;
 also Mackinaw and Lake Superior Excursion Tickets.

Dogs, Guns and Fishing Tackle Carried Free, at
 owner's risk.
 Camp Cars for fishing parties and families at low
 rates.

It is our aim to make sportsmen feel "at home"
 on this route. For Tourist's Guide, containing full
 information as to Hotels, Boats, Guides, etc., and
 accurate maps of the fishing grounds, send to

A. B. LEET, G. P. A.,

 Exhibition of the "St. Louis Bench Show
 and Sportsmen's Association," for an unusu-
 ally fine display of Duck, Mole-skin and
 Leather

HUNTING SUITS,

which attracted great attention and were
 much admired by all Sportsmen.

THE BOSTON

SHOOTING SUIT.

Manufactured only by

G. W. SIMMONS & SON,

BOSTON, MASS.

NEW YORK AGENTS:

Fowler & Fulton,

303 BROADWAY,

The Best in Use.

ONLY ONE QUALITY MADE, AND THAT IS
 THE VERY BEST.

Flexible Waterproof, Tau-Color Duck.

Each article—coat, trousers, vest and hat
 cap—has the name and manufacturers' ad-
 dress stamped upon it, and no suit is genuine
 without it bears this imprint.

We make no discount except to the trade.

The price of the suit complete is \$13.

The material is of the best quality of duck,
 waterproofed by a patent process. The color
 is that known as "dead grass shade."

The seams and pocket corners are copper-
 riveted, and nothing is neglected to make the
 whole suit complete in every way.

This is what one of our best sportsmen says
 of it, writing from camp: "Although I had
 been nearly eight hours under incessant rain,
 laboring and striving along under adverse
 circumstances, yet I found myself compara-
 tively dry, and my clothes without a tear. For
 the benefit of our brother sportsmen, let me
 advise one of Messrs Simmons' (of Boston,
 Mass.) Waterproof Suits. Oh! what a relief
 it was to find one's tobacco was dry, and that
 one could light a pipe; that you could laugh
 at your miserable friend, who stood shivering
 and shaking as if he had the palsy; and then,
 next morning, oh! what fun it was to see him
 mending his clothes, while I had not a tear to
 complain of! Ventilation, that great bane of
 waterproof suits, is legislated for in the
 most ingenious manner. No sportsman should
 fail to supply himself with a suit which is at
 once cheap, practical, and will last an almost
 indefinite time."

Our Flexible Tau-Colored Water-Proof

Leather Coats, Breeches, Vest, Leg-

gings and Caps are considered the finest

things ever made.

SCHUETZENFEST

The FOREST AND STREAM AND ROD AND GUN having given a gold medal for team shooting at the

SCHUETZENFEST

of the Sharpshooters' Union of the United States of North America, the Executive Committee of this Union takes pleasure in informing their American friends that they will make all arrangements for team shooting for this medal. The match will take place at the Schuetzen Park, Union Hill, on

Monday, June 24, 1878,

at 11 A. M. Each team to consist of eight men. Entrance fee, \$15 per team. The team making the highest score to win the Forest and Stream and Rod and Gun Medal. The entrance fee may, after deducting cost of markers, will be divided among teams, pro rata. All the members of each team must belong to the same society, and must have been members of it for ninety days previous. The entrance fee is to be paid on or before June 10, 1878, to Mr. F. HARENBURO, Treasurer of the Sharpshooters' Union, No. 100 Greenwich Street, N. Y. Any rifle club or shooting society of the United States will have the privilege of sending their teams without being members of the Union. Any communication directed to the secretary will be promptly replied to. GEO. AERY, President, J. L. BEHRENS, Cor. Sec., 31 Bowery, New York.

Cartridges for Target Practice.

Send for Illustrated Catalogue.

FOWLER & FULTON, General Agents, 300 Broadway, N. Y.

Fisher's Muzzle-Loading Long-Range Match Rifle.

Interchangeable Grip and Heel Venter Scale, and Wind-Gauge Front Sight, with Spirit Level. Fine English Walnut Pistol-Grip Stock.

This Rifle requires no patent muzzle to load it. Uses the same bullet as the Sharps and Remington rifles. Loads the same as breech-loaders, where they do their best work, viz., from the muzzle. As Perry's Score-book says: "No shells to cart around and pay for. Can be used at one-half the expense of the breech-loader. With powder and balls always ready for a day's sport." Every rifle guaranteed. Breech-loading rifles at manufacturers' prices. All long-range rifles sighted and tested at Creedmoor without extra charge. Agent for P. WEBLEY & SON'S BREECH-LOADING SHOT-GUNS. Send for Circulars. H. FISHER'S Illustrated Catalogue and Score-book for Rifle Practice, price 25 cents.

HOMER FISHER, 260 Broadway, Cor. Warren St., New York.

Bogardus' Patent Rough Glass Balls and Glass Ball Traps.

These Traps are the only ones that give satisfaction, as they are simple of construction, easily set, and not liable to get out of order, and they throw the ball in a manner that more closely resembles the flight of a bird than any other trap in the market. The Patent Rough Glass Balls are made of uniform weight and thickness, and have a corrugated surface that strengthens the ball for abatement to any part of the country, prevents the glancing of shot, and thereby insures the breaking of the ball when hit. CAPTAIN BOGARDUS was the first to introduce the ROUGH BALL, and at a price far below the smooth ball at that time.

Balls and Trap can be ordered through all Gun Dealers. Liberal discount to the trade.

MY IMPROVED TRAP (warranted), which will throw a ball in any direction from the shooter at the option of the puller, is now ready for the market. Price \$8. Old style, \$6. Parties buying glass balls will receive, in each barrel containing 300 balls, a score book and rules for glass ball shooting, containing 40 pages.

HEADQUARTERS FOR BALLS, HAGGERTY BRGS., 10 Platt Street.
FOR TRAPS, HART & SLIGAN, Newark, N. J.

Second and enlarged edition of "Field, Cover and Trap Shooting," by A. H. BOGARDUS, containing instructions for Glass Ball Shooting, and chapter on breeding and breaking of dogs by Miles Johnson. Price \$2, by mail, postage paid. Address, Capt. A. H. BOGARDUS, Elkhart, Logan Co., Ill. Dec 6

IRA A. PAINE'S
FEATHER FILLED GLASS BALL.
PATENTED OCTOBER 23, 1877.

The "Standard" Ball.

The Bohemian Glass Works would respectfully call the attention of all dealers in Glass Balls to the fact that the Paine Patent Filled Ball is the STANDARD AND ONLY BALL MADE TO A SCALE, therefore we would respectfully caution the dealers against laying in a stock of unsaleable articles for the Spring Trade, when you can purchase the Best Ball ever made at prices less than for other inferior balls.

No other ball affords the PLEASURE of the Feather Filled Ball, and no other Ball is as beautifully made. It will break in every instance when hit by shot, and is sufficiently strong to prevent breakage either by transportation or falling on the grass.

Every ball is weighed and examined, then packed with the greatest care, in barrels of 300.

Send for price list. Special inducements to the trade.

HEADQUARTERS BOHEMIAN GLASS WORKS, 214 Pearl Street, N. Y.

W. W. Greener's Champion Treble Wedge Fast, Breech-Loader.

THE WINNING GUN.

The winning gun also at Philadelphia, 1876, in the pigeon shooting match between Capt. Bogardus and Mr. South for \$500 a side, South killing 56 birds out of 100, using one barrel only.

The winning gun also at the great London Gun Trial, 1875, beating 102 guns by all the best makers of Great Britain and Ireland. THE PATENT TREBLE WEDGE FAST BREECH-LOADER is the strongest and most durable ever invented, and the most successful gun of the period. Patented in the United States, Oct. 5, 1875; No. 163,323. BEWARE OF INFRINGEMENTS OR IMITATIONS.

Scenes in the Choctaw Nation. No. 2.

I WAS the first to awake, and I did so with the unpleasant sensations of one who has slept only long enough to be tantalized by it. I had indeed hardly slept at all, but had only been passing through a series of disagreeable dreams. The lack of food the previous day, the long ride, and the stings of the ticks had worked me into an incipient fever, and after sleeping perhaps an hour, I had begun to dream. In these dreams peals of thunder and vivid flashes of lightning kept company with myriads of gigantic ticks which attacked me with a relentless fury, as if to avenge the death of those Nichols and myself had annihilated before retiring. One monster, I remember, nearly as large as a sea turtle, seemed foremost in blood-thirstiness, and was just preparing to plunge his proboscis into my heart, when I made a desperate struggle to escape from his clutches, and in doing so shook myself awake.

When I first opened my eyes I thought that surely I was still either asleep or dreaming. It was about midnight, and as dark as midnights proverbially are. The starlit sky, under which we had gone to sleep, had been again overclouded. Not a star was to be seen, and indeed, the sky itself was not visible, though I had noticed before lying down that directly over our heads was an opening in the tree tops. The clouds, however, that darkened the sky did not seem to portend a storm. There was no thunder nor lightning, and the air had not that peculiar "feel" always discernible before the approach of rain. The wind had died away, and not a flutter was heard among the branches. The stillness was almost appalling. The deep breathing of Nichols, still asleep, was the only sound that reached my ears. The tree toads and the cicada were silent; the whip-poor-will no longer uttered his "hostly" cries; the ponies, tired out by their long walk, had ceased cropping the grass, and were apparently asleep. It was one of those moments, mysterious in cause and mystifying in their influence, which frequently occur in forest wilderness when everything seems hushed in awe and nature appears to hold her breath as if in expectation of some dread catastrophe.

As I lay there gazing up and out into the darkness a strange feeling of dread crept over me, causing me almost to tremble. I confess this now without blushing, though I know it is like confessing to a boyish weakness. I do not think I am a coward. On one occasion at least I have faced what I believed to be certain death, and I met his gaze without a tremor, and more than once have I run risks which others have pronounced reckless. Nor was it fear which, on this occasion, caused me to hold my breath as I lay there trembling. I knew there might be dangers in that forest—dangers from wild beasts or wilder men. I had heard many stories before leaving Texas of the Choctaws murdering white travelers through that territory. But had I known that in the woods around a host of painted devils were lurking in ambush I do not think it would have caused the cold chills to crawl up my back as they did. It was a feeling rather of dread than of fear. The intense darkness, the grave-like stillness, working on my half-fevered system, had to a degree unstrung my nerves and made me an easy prey to incubus. Such was my nervousness (I smile now to recall it) that I put out my hand and rested it upon Nichols to assure myself that I was not alone. Somewhat quieted by this I resumed my recumbent position and tried to forget my surroundings in sleep.

But it was of no avail. The sense of danger oppressing me would not down at the bidding of Morpheus. Close my eyes never so tightly the deep gloom would still be apparent, and the breathless silence would still seem to haunt my ears.

Hark! What sound was that? Surely I heard something besides the lungs of my companions. It was in the direction of the horses. They had apparently awoke from their slumbers and were moving about as if to place themselves in easier positions. This was my first thought on hearing the noises. The rustling of the grass in the direction where the horses should stand seemed to admit of no other interpretation. I could not see them, nor could I had they been standing within ten feet of me owing to the intensity of the gloom around us. But I knew the direction from our bed in which they had been tied, as well as the distance, and felt certain that the noises were caused by them. It did not add to my nervousness, but rather tended to soothe it, by breaking the silence which had grown so oppressive.

Suddenly, however, the character of the rustling noises seemed to change. The horses appeared to be stepping about quickly, going, so far as I could judge, quite to the end of their tethers, and then stamping around in a semi-circle at the ends of the ropes. Soon they began to stamp harder and to prance around more energetically as though frightened at something and trying to get out of its reach. This was followed by a half angry, half-frightened snort, as if the object feared had approached nearer, or its presence had grown more unendurable. I was convinced that we had neighbors for which it would be prudent to prepare. I reached out my hand and took up my rifle, at the same time giving Nichols a shake that aroused him from his slumbers.

"What's the matter?" he growled, rubbing his eyes as though bewildered by the darkness. "Jupiter! ain't it dark?"

"Sh—! Do you hear those sounds?"

"What sounds?"

"Out where the horses are."

"I don't hear anything except the horses stamping around."

"Nor do I, but did you ever hear horses stamp in that way when there was nothing around? There! did you hear that?"

A frightened rush was heard at this instant, followed by the angry snort above mentioned.

"I tell you, Morg, there's something dangerous out there, and we'd better get ready for it."

"But what can there be?"

"Well, there might be a bear, or a panther, or a Choe'aw, or the devil, but whatever it is it is dangerous or our ponies would not act so."

"Good Heavens!" said Nichols. "There it is! Don't you see it?—right over where the horses are—up from the ground—two balls of fire!"

I looked in the direction indicated, and there, sure enough, beheld the objects which had evidently frightened the ponies. Gleaming out of the intense darkness were two large round orbs of fire. They were up some ways from the ground, and appeared to be about three inches apart. They were not motionless, but seemed to sway from side to side, and at times to move on their axes. Once they disappeared for a moment, but soon re-shone with all their baleful brilliancy. They were apparently full and round, though they at times assumed oval and oblique shapes.

Both Nichols and myself knew very well what the phenomena were. We knew that the fiery globes were not balls of fire, but the dilated eyeballs of some night-prowling animal. What animal we were not sufficiently skilled in woodcraft to determine. It might be a bear, or a panther, or a murderous Choctaw, or something different from all three. We knew that bears and panthers were both abundant in those woods, or at least we had been told so, and both are tree climbers. An old hunter could have told us which we were now gazing at, at a glance, but we were not old hunters.

I will not say we—myself at least—were not frightened. I was, but not to such an extent as to lose control of my senses. I retained sufficient coolness to realize that, unless interrupted by some move on our part, our nocturnal visitor was likely to make away with one or both of our horses, and this was a contingency to which I could not consent. I determined to take the initiative. Telling Nichols to get his rifle ready to support me in case I missed the mark, I quickly adjusted a fresh cap, and, lying over on my back, I rested the barrel across my knees, and as well as I could in the dark, took aim at the two glaring eye-balls. Then, waiting a moment to be sure my nerves were steady, I pulled the trigger. As the sharp crack rang out upon the air, the hosts of chirruping insects seemed to awake and filled the woods with their cries. At the same moment, so simultaneously, I thought surely I had missed my aim, the two eye-balls leaped upward and outward, and the next instant we heard a dull thud, as of some heavy body falling upon the ground. At the same time the two ponies, with frightened snorts, sprang away to the opposite side from where the eyes had been, and were heard to bring up with a jerk as they came to the end of their tethers. There they stood stamping nervously, long after other sounds had again subsided into silence.

For some time we lay with bated breath, listening for some sign which should show the effects of the shot, but we did not hear a sound, save the dull thud spoken of. I had been so occupied with my rifle that I had not followed the after-movements of the object aimed at, but Nichols declared that by the flash he had seen the monster in the act of springing, and that the spring and the shot both came together. He could not tell what the animal was, but it was at least twenty feet long! I tried to induce him to go out and see what had become of the game, but he persistently declined, and as I felt about as he did on the subject, we concluded to wait till morning before stirring from our couch.

By the first flush of morning light we were on our feet, and having reloaded my rifle, we walked out to the scene of the night's adventure. As we approached the spot where the ponies were tethered we could see that the grass had been trampled down considerably, but it was still too high to discover whether or no there was any trace of our nocturnal visitor. It was not until we were almost up to it that we beheld it. We had reached a spot directly under the limbs of a rather low-growing oak, one of which limbs was about fifteen feet from the ground. There, just out from under this limb, his lifeless body damp with dew, lay the monster panther, whose skin I have said now adorns my library. The carcass was doubled up in a heap, as though life had departed before the body struck the ground. It was evidently an old male, which had escaped being hunted to any great extent, and under conditions favorable to development, had grown to an abnormal size. My bullet had entered the skull directly between the eyes, and had caused instant death. For I am not exceptionally skilled in marksmanship, and had the wealth of the Indies been offered me to repeat the shot, I could not have accomplished it. It was simply a lucky accident, such as often occurs to those who use fire-arms to any great extent. I remember once cutting off a woodpecker's head, at a distance of thirty feet, with a small pocket revolver, and yet as hour later, with the same pistol, I fired more than twenty shots at a target a foot in diameter, and failed to even scratch it! It was not skill but accident that controlled these cases.

While Nichols was picking up our traps, I proceeded to skin the panther, for I was determined not to lose such a trophy. I had nothing but a dull jack-knife, and the skin was terribly tough, and it took me nearly four hours to accomplish the task. I left the claws and skull in the hide, intending some day to have it stuffed. After scraping off all the flesh I could remove, I rubbed the inside of the skin with toilet soap—the only chemical I had about me—in hopes it would help preserve the skin until I could get some arsenic. Then I rolled up the trophy, and having eaten a few berries Nichols had picked, we were ready for another day's journey. But before starting there was an important question to be settled, and that was which way we should go. The sun was high in the heavens, and we could easily tell the points of the compass. But where was the road we had traveled the day before? We had left the road and ridden a quarter of a mile or so to one side, in order that our ponies might not attract the attention of some wandering semi-savage, but the events of the night had made us quite forget which side of the road we had turned to. I was certain we had turned to the right, while Nichols was equally certain we had turned to the left, and as both of us could not be right, and as we both had fair memory under ordinary circumstances, we could not agree as to which was the proper direction to take. At last, however, I gave in to my more enthusiastic companion, and we turned our horses' heads to the southward.

Sure enough, he was in the right, or seemed to be. After riding about a quarter of a mile we came to a road leading in a direction east by north. I say a road, but it was only by courtesy it could claim that title. It was merely a dim vista through the woods, with here and there a tree trunk on either side, showing the well-known "blaze." There was not a track on the ground to show that the road had ever been traveled. Along this road we started, and rode on for several hours without halting. The scenery was the same as on the previous day—the same green carpet of grass, the same seemingly endless grove of oaks. It looked like a likely place for game, but we did not wish to lose any time to hunt it, and though we were getting rather hungry, we thought we could stand it till we reached some place where we could buy provisions, or until some game should show itself along the road. This last was what we expected. We had been assured before leaving Red River that we would have no difficulty whatever in finding an abundance of game without leaving the trail.

After traveling for several hours the disagreeable thought intruded itself that the road we were on was not the right one. We had been told that it was only forty miles from Shawnee Town to Graham's Ferry, and if this was the case we should have reached the latter place by this time. Besides, the road, after the first few miles, did not run in the right direction. It tended too much to the South, as though running to some point on Red River. However, there was no help for it now, and, whether right or wrong, the cheapest plan was to go on. About three o'clock we halted for a short time to rest our horses, and while I watched them, Nichols strolled out into the woods to see if he could scare up any game. I heard the report of his gun after a while, and he soon returned with a raccoon, the only living thing he had seen, and even this he had secured at too great a cost, for, on discharging his rifle, the nipple had broke off close to the breech, and as we had no way of extracting the remaining piece, the weapon was for the time practically useless.

After resting awhile we resumed our journey, taking the coon with us, intending to make a supper off of it should nothing better show itself. At intervals the road was crossed by foot-paths or trails running in various directions. These trails form a perfect network all over this part of the nation. They cross and recross each other at all angles and in all places. Probably the destination of each one is known to their copper-skinned trappers, but to the tyro in woodcraft they present an inextricable labyrinth. Here and there are passed rude log huts, which seem to be temporarily deserted by their tenants. Only one out of some dozen we passed was inhabited. In front of this was grouped a party of Choctaws consisting of a "buck," a squaw, and several papooses of different ages. These last, as soon as we appeared, made themselves scarce in all directions. We addressed ourselves to the "buck," and asked him if we were on the right road to Graham's Ferry. To our vexation, however, he did not understand English, and all our inquiries only elicited a series of unintelligible grunts. This, as we were afterwards informed, is always their custom, unless the stranger opens the conversation by offering some present, as tobacco, or a "drop of the eraythur." Then they can understand English, at least sufficiently to carry on such a conversation as the circumstances would naturally suggest. As we were not posted in these little tricks of Indian diplomacy, we were forced to continue our route unlightened as to its correctness. Late in the afternoon we arrived at what seemed to be a river "bottom," through or into which our road ran. It was a dismal place in the full sense of the word. The grass ceased, and we found ourselves riding over a tract of hard packed mud, the surface of which was a thick slime. The oaks gave place to gigantic pines, which towered upward and interlocked their dense needle-covered tops scores of yards above our heads, completely shutting out the sunlight. There was no underbrush, that we could see, and the vines and creepers, so prominent in the ride from Mound City to Shawnee Town, were here wholly absent.

It was about five o'clock when we reached this place, and the slanting sunbeams, playing over the lofty tree tops, told that the sun was rapidly approaching the horizon. But very little of his light had reached us in the oaken woods, and when we entered the bottom it ceased altogether. It would have been wiser, perhaps, to have hesitated before entering such a place at such an hour, and to have waited till morning before attempting such a passage, and Nichols urged me to this course. But I was not to be convinced that the tract was of any considerable width, and as we had now both agreed that Nichols had been in the wrong about the proper direction in the morning, he reluctantly assented to the venture, and together we entered the gloom.

It was not long before I realized our mistake. The sun set, and to replace his light, nor moon nor star shed their rays down through the needles of the overshadowing pines. A veil of thin, hazy clouds draped the heavens, completely shutting off all light. Before we had ridden a quarter of a mile, we were not only not able to distinguish the "blazes" on the trees, but were straining our eyes to keep from running our horses' heads against the trees themselves. The darkness was so intense that Nichols swore he could feel it give way as he urged his pony through it. At the same time a dampness, as of a thick fog, became palpable to the senses, and besides dampening our clothes, chilled our bodies to the bone. At last, as by a common impulse, we drew rein to consult as to what was to be done.

We did not stop long. We felt it would be a mere waste of time. There was but one course open to us now, and that was to go on. We could not go back. We would have been as likely to lose the way as by going forward. Neither could we camp where we were. Whether cowards or not, we would not have dared to go to sleep in such a place. The very air seemed redolent with death. It was a spot where malaria might exult to dwell, and to have slept all night on that slimy soil, inhaling the noxious vapors which seemed to permeate the atmosphere, would have been certain to implant in our systems some dreadful miasmatic disease. We deemed it compulsory, almost, to go on. We did not try to distinguish the road any longer, for all such effort was evidently vain. By conversing we contrived to keep together, save when obliged to swerve to one side by an intervening tree. We could not see the trunks, but trusted solely to the instincts of our animals. We could not even see each other, and were only conscious of each other's presence by our conversation and the occasional rubbing of our ponies' sides.

Deeply disagreeable as this place was—and it promised to be even more so—it was possible, as we learned before escaping from it, for something still more disagreeable to occur. We came to a place where there was water. It was a muddy bayou, perhaps, or it might have been some running stream emptying into the Red. We could not see it to judge of its character. We only knew of its existence by its effects. My first intimation of it was feeling my horse's shoulders suddenly sink, and the next instant find him swimming under me. So sudden was the plunge that, not dreaming of such a contingency, I was quite startled, and in the surprise my rifle slipped out of my hands and fell with a plunge into the water, taking along with it the raccoon, which, for convenience sake, I had carried tied to the muzzle of the piece. I could not stop and look for it, for the horse was swimming vigorously ahead, and, great as the loss was, I was compelled to submit to it. The pony soon reached the land, having swum, perhaps, a dozen lengths, and I halted and shouted to Nichols, whom I had not heard for several minutes past. He had been carried away by the water to some distance, and his answering shout seemed to come from some gloomy depths; but by shouting to each other he was enabled to find his way up to me, and we again rode on, this time not quite so briskly as before.

How long we rode in this darkness we could not tell, when we finally emerged from it. We felt instinctively that we had lost the road, but when or where we could not tell. The width of the bottom we could not guess at, for we did not know but we had ridden in a circle. We only knew it seemed to us that we had ridden many hours and passed over many miles of territory. The darkness ever lengthens the hours, haunted by thoughts of dread and crowded with nightmares of reality, and whether we passed a longer or shorter time in the bottom, it seemed to us an age. At last, however, we emerged from it. We got at last out from among the pines, off of the slimy soil, and to a place where, through an opening in the trees, we could discern the murky sky. The first sign we received of our exit was the brushing of grass against the horses' feet and the occasional rubbing of underbrush against our legs. We could also tell by the firmer tread of the animals that we were off the slimy mud, and we no longer felt the disagreeable dampness which had exuded therefrom.

Rolling some old letters into a taper, I halted for a moment and ignited the roll, which made a brilliant, though ephemeral, light. By this blaze we saw that we were in one of those small glades or savannas, which are so abundant in these woods. Around us we could see the oak trees, and at our feet the rich rank grass. In the centre of the glade, just as the light was flickering out, we noticed a small bush growing, and the next moment we were in total darkness again.

As we could gain nothing by going further that night, we determined to stop here until morning, which we thought could not be far distant. We picketed our horses to the little bush, and having arranged our traps as well as possible under the circumstances, without thinking of supper or even of our prayers, we soon forgot our trouble in sleep.

GUY RIVERS.

Fish Culture.

[FROM OUR REGULAR CORRESPONDENT.]

Abstract of the Twelfth Annual Report of the Commissioners on Inland Fisheries, Massachusetts, for the Year Ending Jan. 1, 1878.

MASSACHUSETTS was a pioneer in the work of fish-culture, and the efforts of their able commissioners have been well directed and rewarded with very encouraging results. The work of the past year has been directed to the introduction of a variety of food fishes. A number of streams have been reopened and stocked with alewives.

As a result of the suicidal conduct of the fishermen on the Merrimac, the supply of shad has been even smaller than was anticipated. The Commissioners complain of the short-sight-

ed action of the shad netters in destroying the source of their own revenue; and we presume that this stupidity of otherwise sensible people—which, we need not state, is not confined to Massachusetts fishermen—is one of those paradoxes which will probably puzzle us as long as there are fishes and fishermen. There is reason to hope, however, that the disastrous result of the past injudicious greed may, for a time at least, teach the wisdom of less greedy conduct. We regret to learn of the still unsettled difficulty between the States of Massachusetts and Connecticut. An appeal from the Commissioners of the former State to those of the latter, to so regulate the shad fisheries of the Connecticut that Massachusetts might derive some deserved revenue from that industry, has proved ineffectual to remedy the above.

Two hundred thousand California salmon spawn received in 1876, 130,000 were hatched and delivered, 10,000 going to Saugus River, 30,000 to North River, 50,000 to Lancaster, and the rest to the head waters of the Merrimac. There is, however, a mystery about the young of these fish which has yet to be solved. Notwithstanding the hundreds of thousands that have been put into New England waters, no one has yet been able to say with certainty that he has seen a single smolt. Either they cannot endure the winter in our rivers (which is not probable), or the smolts so closely resemble the young of *Salmo salar* that they cannot be distinguished, or, what is most likely, their habits lead them into deeper and warmer water, and they drift earlier to the sea.

The distribution of the 150,000 young land-locked salmon was to the following ponds:

Wakefield, 4,000; Waltham, 1,200; Lunenburg, 4,000; Lincoln, 4,000; Middleborough, 20,000; Newton, 3,000; South Weymouth, 4,000; Winchendon, 4,000; Greenwood, 4,000; East Bridgewater, 4,000; Ashburnham, 5,000; Buxford, 3,000; Middleton, 2,500; Widdet, 5,000; Georgetown, 4,000; Wilbraham, 5,000; Sandwich, 4,000; Framingham, 5,000; Natick, 4,000; Pittsfield, 5,000; Nantucket, 2,500; Berlin, 3,000; Braintree, 3,000; Lancaster, 15,000; Duxbury, 6,000; Halifax Pond, Plymouth, 10,000; Shawsbire River, 8,000; Huntington, 3,000; Medford and Winchester, 2,000; Essex, 4,000.

Recent experiments with the *Salmo salar*, and observations on the Merrimac, appear to indicate that none of the young salmon go to sea before they are two years old, and that during that time they are to be found at all seasons in the headwaters of the streams in which they are deposited. Another important fact has been ascertained, which may save expense in stocking rivers. Many of the fry deposited about two miles above Livermore Falls went twenty or thirty miles up the river, ascending the mountain streams, and pushing into all the tributaries, their instincts leading them into waters too rapid and cool to sustain perch and pickerel, and where their only enemies are brook trout and the piratical poachers calling themselves anglers.

The return of mature salmon to the waters of the Merrimac this year commences a new era in the history of fish culture in this country. It is, therefore, with feelings of the greatest pleasure that the commissioners present the report of Thomas S. Holmes, of what he found passing over the Lawrence fishway during the past season, which report records the passage of salmon in June and July.

In addition to the above record there was a fall run of salmon, which commenced Oct. 11 and ended Oct. 30. These fish, so far as seen in the way, were from six to ten pounds in weight. Much larger ones may have passed over, as Mr. R. B. Holmes saw one three feet long, near the hatching-house at Plymouth, the first of November.

The success of salmon culture is therefore assured, and there is no reason, except our own want of management, our own neglect of that which Nature has so bountifully provided us, why our rivers should not be as productive as those of Europe. Under proper culture, with wise regulations, strictly enforced, it is not easy to over-estimate the advantage that may accrue to the State by successfully carrying out what has already been demonstrated.

To this end we have united with the commissioners of New Hampshire in establishing, at Livermore Falls, a hatching house and ponds, supplied with both spring and river water. These are situated within a stone's throw of the river, where, by means of weirs, the spawning salmon can be turned into them. It is reasonable to think that the establishment may do as well as the celebrated one at Bucksport, conducted so skillfully by Mr. Atkins. The cost of these works will be small, probably not exceeding \$4,000. In 1871 the price of salmon spawn in Canada, the only place it could be obtained, was \$40 per 1,000 in gold. The salmon works at Penobscot, Me., afterward reduced the price one-half; and subsequently the Bucksport establishment, started by the commissioners of Maine, Connecticut and Massachusetts, afterward assisted by the U. S. Commissioner, was able to furnish spawn at about \$3 per 1,000.

FISH CULTURE IN WEST VIRGINIA.

RONCEVERTE, Greenbrier Co., W. Va.,
April 23, 1878.

EDITOR FOREST AND STREAM:

Dear Sir—You will no doubt be interested in hearing something about what West Virginia (following the good example set by so many of the other States within the last few years) has been doing in the matter of fish culture. As the population of the State consists principally of small farmers or cattle men, scattered about over a territory in many places wild and rough, and taken altogether is not much more than half that of the city of Philadelphia, the State cannot afford to spend very large sums on public improvements.

However, an appropriation of \$20,000 was judiciously expended at the Centennial and a creditable display made of coal, timber and other resources of the State. Last year a fish commission was appointed and an appropriation of \$3,000 made to begin operations with.

The commissioners are John W. Harris, Esq., of Louisburg, Greenbrier Co., Pres. of the Board, and Messrs. Henry B. Miller, of Wheeling, and C. S. White, of Romney. The commission could not get to work until quite late for operations last year, but a hatchery was established at Romney, and from eggs bought in Pennsylvania about 175,000 brook and salmon trout were hatched and distributed to various streams throughout the State. More of these would have been placed in the streams by the commission, but about the time the fry were ready to distribute the hatchery was robbed and quite a num-

ber of fish taken off, presumably by persons who did not want them sent away from their part of the country. There were placed in the Ohio River 12,000 California salmon. There were also placed in the Greenbrier River at Ronceverte 5,000 of the same fish. These fish, unless they will in time become land-locked, would hardly benefit the Greenbrier, I think. The journey is a long one from the sea to the mouth of the Ohio, let alone the ascent of the latter to the Kanawha, that to the New River, and that again to the Greenbrier. New River would be a fine stream for such fish along the lower 30 miles of its course, as it runs through a canyon and is very rough and affords a fine mixture of falls and pools. Of the shad put in the Greenbrier some five or six years ago nothing has ever been seen since that I can discover. Shad have, however, appeared in the Kanawha, several well authenticated instances having occurred when they were captured. The shad is so timid a fish and not very hardy that I would doubt its making the long journey here from salt water if there were no obstacles, but I have no idea that shad could get over the falls of the Kanawha or Richmond's Falls on New River. These are actual falls, not rapids. The rapids themselves would likely deter shad from getting up New River. The Greenbrier River is singularly destitute of fish affording any pleasure in the catching. Catfish, caught by the natives on lay-out lines, or, as they call them, "trot lines," and a few "horny head" chub being about all the fish in the stream except at the extreme head waters in the upper end of Pocahontas Co., where there are some trout. There are no good trout streams flowing into the Greenbrier. The stream would be a pleasant one to fish and quite easy of access as the C. & O. R. R. follows it for 40 miles of its lower course, and the valley is well settled up stream for 70 or more miles, and nearly to its head. Last autumn 500 black bass from three to five inches long were put in the Greenbrier at the Kanawha Pike bridge, five miles above Ronceverte, and 300 in New River near Richmond's Falls. This spring there have been put in the Greenbrier at Ronceverte 7,000 land-locked salmon and 150 black bass: the salmon some time before the bass. The latter were all fine, full grown fish—spawners. If the bass take as well to the Greenbrier as they did to Jackson River and the James, where there is now fine fishing to be obtained by leaving the C. & O. R. R. at Clifton Forge, there will be a fine stream for the angler in a few more seasons. The commissioners expect to get another appropriation at the next session of the Legislature, and it is to be hoped that they will be enabled to go on with the work now begun. Truly yours,

C. C.

SALMO SALAR IN THE MISSISSIPPI.

JACKSONPORT, ARK., April 15, 1878.

EDITOR FOREST AND STREAM:

Concerning the salmon reported a week or two ago in your paper as having been taken in the Mississippi at Memphis, I regret to say that in all human probability his front name is Jack; in other words, he was a jack salmon, Ohio River salmon, glass-eyed pike, American pike perch (*Lucio perca*). Mottling, resembling that of the rattlesnake, is not at all unusual in full-grown specimens of this fish, as taken in the waters of this vicinity. If southern correspondents would remember that the true salmon has all soft-rayed fins excepting the second dorsal, which is adipose, and that no fish with spine-rayed back fin is of that genus, a great deal of confusion and inaccuracy would be spared us.

While on this subject I would like to say, by way of suggestion merely, that the difficulties in the solution of the problem of stocking Mississippi waters with the California salmon (*Salmo gairdneri*) would probably be materially lessened if fish could be placed in the White River of Arkansas, somewhere above the mouth of Black. My reason for this faith is that pure cold mountain water, flowing with a rapid current over rock and gravel bottom, can be reached from the sea on this river by a route several hundred miles shorter than any other. A glance at any good map will conclusively show this. My opinion is founded on the best observations I have been able to make. Difficult as I recognize this problem to be, I can but believe that should specimens of the fish ever reach the mouth of the White River on their upward journey, all inseparable obstacles might be considered as surmounted. The character of the water, except at the very highest stage, would be well suited to the continuance of the journey; much better than any part of the Arkansas, Missouri or Mississippi, and equally as favorable as the Ohio, and much nearer the Gulf.

The upper waters of the river can be reached by way of Springfield, Mo. If success be possible, I can conceive of no achievement more important.

YELL.

STRIPED BASS (*Morone lineatus*) IN FRESH WATER.—Boston, April 24.—Genio O. Scott says in his book that striped bass can be acclimated in fresh water:

"For a few weeks in the estuaries of the southern coast of Cape Cod, school bass (i. e., from two to five pounds) can be taken, at certain periods of the tide, as fast almost as the line can be re baited and got into the water; and within two or three miles of these places are large fresh water ponds or lakes so full of feed that the numerous black bass that are there can with difficulty be persuaded to bite. It would be the easiest thing in the world to put in several hundred striped bass in a season, and if they would thrive and multiply, a very gamey and bold-biting fish could be added to our waters.

Doctor.

[Some steps have been taken to propagate striped bass in Coney Island Creek, near this city, though no really practical measures have yet been adopted. We wish our Boston friends would undertake the work. A variety of striped bass (*Morone chrysops*) is found abundantly in the tributaries of the Mississippi River, and notably in Murdoch Lake, near St. Louis. The bass ought to thrive in fresh water.—Ed.]

FISH MORTALITY.—There is a reported mortality among the black bass in Hohomock pond, Pembroke, Mass. Similar troubles in New Jersey waters were reported in Townsend stream last year, but two months later in the season. The Hohomock pond water is pure and clear, and no adequate reason can be assigned for the mortality. We suggested last June that there might be some fatality among the larvæ and crustacea upon which the fish feed, or to poisonous gases percolating through the earth from beneath. Fish Warden Pearson, of Morris county, N. J., ascribed it to the peculiarly warm spring. Who can explain it?

SHAD IN TENNESSEE.—George F. Ackers, State Fish Commissioner, writes to the Nashville Banner that Bob Edmonds, a fisherman, caught five genuine shad in a net below the city last week. James O. Davis, an old Virginian, partly raised on shad, examined them closely, and decided that they were the genuine salt water shad. If this can be confirmed by another catch and exhibited for inspection, it will establish the fact of the wisdom of the United States Fish Commissioner's action, in planting nearly 200,000 young shad in the Cumberland several years ago.

Natural History.

NOTES ON SEVERAL RARE BIRDS TAKEN ON LONG ISLAND, N. Y.

By N. T. LAWRENCE.

[Read before the Linnean Society of New York, March 23, 1878.]

THE following species were observed and taken during a period of time extending over six years. Most of the species noted are of rare or unusual occurrence, and two of them *Colinus ludovicianus* and *Tringa bairdii* I am quite certain have not been previously recorded from Long Island.

I am indebted to Mr. Robert Lawrence, of Flushing, L. I., for the notes from that locality and Moriches.

Minusippoglossus, Mockingbird.—Two specimens taken at Rockaway; the first, a young male taken in September, 1871, which, from its nestling plumage, had probably been bred in the vicinity. The second, a fine adult male, was taken Nov. 7, 1877, in an open field a short distance from the salt meadow.

Colinus ludovicianus, Loggerhead Shrike.—One specimen (female) taken at Rockaway, Sept. 19, 1875, on a piece of upland of about nine acres in extent, containing a scattered growth of low cedars, and surrounded by salt meadows. Another was observed in September, 1876, but I did not secure it.

Electroplatus lapponicus, Lapland Long-spur.—One male shot at Rockaway in December, 1871, in company with the shore larks (*Eremophila alpestris*). A second specimen was procured in Fulton Market, March 13, 1875, which probably came from Long Island.

Passerculus princeps, Ipswich Sparrow.—Five specimens taken at Rockaway, among a low range of sand hills that skirt the main shore of bay. The first in Dec., 1870; second and third, Nov. and Dec., 1872; fourth, Nov., 1874, and fifth, Jan., 1878 (See "Nat. Ornith. Bull.," April, 1878).

Contopus borealis, Olive-sided Flycatcher.—Mr. Robert Lawrence had the pleasure of taking a full plumaged male, May 24, 1872, shot on a spruce a short distance from his residence at Flushing.

Centurus carolinensis, Red-bellied Woodpecker.—A fine adult specimen was taken by Mr. Robert Lawrence in a piece of wood near Flushing in October, 1870. I have an adult male procured in Fulton Market, Nov. 2, 1872, which probably came from Long Island.

Aegialitis wilsonii, Wilson's Plover.—An adult male taken at Rockaway, July 1, 1872. From its slightly worn plumage and excited actions at time of capture I surmise may have been breeding in the vicinity, but could find no trace of nest.

Stercorarius wilsonii, Wilson's Phalarope.—On the 3d of Oct. 1872, at Rockaway, I met with a pair of these birds, in company with two big yellow legs, *Totanus melanoleucus*, and succeeded in taking one, which proved to be a young male; another was observed in October, 1874, but did not secure it. On one occasion, while blue-fishing off Fire Island, in the month of August, we came across a party of five Phalaropes swimming in the ocean, which, from their size, I presume were the Wilson's.

Lobipes hyperboreus, Northern Phalarope.—At Rockaway, on the 24th of August, 1874, I killed a young male and immature female out of a passing flock of least sandpipers (*Tringa minutilla*). Another was captured in August, 1875.

Mareca scolopacea, Greater Long-beak.—On the 27th September, 1873, at Rockaway, I took a young female. When shot it was in the company of *Totanus flavipes*. A second was taken September 25, 1874; another observed in September, 1875, but I did not secure it.

Micropterna himantopus, Stilt Sandpiper.—In all the authorities I have looked up in reference to this bird, I find it stated "as rare or uncommon on the Atlantic coast," which is very surprising to me, for on the south side of Long Island, where it is locally known as the "bastard yellow-leg," it is certainly common. I have quite often, while bay snipe shooting, had parties of from three to five, and very frequently a single bird or a pair came into my decoys. Of four specimens in my collection at present, two are in adult breeding plumage, taken in July; the balance in fall plumage, taken in Sept.

Tringa bairdii, Baird's Sandpiper.—Four specimens taken at Rockaway. The first two in September, 1872, shot on a small piece of meadow, out of a flock of *Tringa minutilla*. The third was taken August 26, 1873, while snipe shooting on a thin strip of sand that separates the ocean and bay. My attention was first called to it by hearing a peculiar long-drawn whistle, and soon after I perceived a small snipe flying very high. The next moment it darted down and settled among my decoys, where I secured it. The fourth was taken in the same locality as the first two, September 20, 1874. Three of the above specimens were males.

Tringa maritima, Purple Sandpiper.—One specimen taken at Rockaway, Nov. 1871, along the main shore of the Bay. It is rather strange that this bird should be so rare on Long Island, for Mr. C. Hart Merriam informs us that it winters and is quite abundant on Falkner's Island, in Long Island Sound.

Tryngites rufescens, Buff-breasted Sandpiper.—Although this bird is more uncommon than rare, still I have only noted four specimens taken at Rockaway, as follows: One, Aug. 23, 1873, adult female; another, Aug. 1874; the other two, Sept. 13, 1875.

Ardetta cilia, Least Bittern.—Mr. Robert Lawrence informs me he has a fine specimen, taken on Flushing Meadows. *Sterna fuscata*, Forster's Tern.—Two specimens taken at Rockaway. One shot along the surf Oct. 1, 1872, the others on the meadows Sept. 3, 1873. Both young birds.

Mareca penelope, European Widgeon.—An immature male procured in Fulton Market, Jan. 6, 1873, shot at Southampton, L. I. (See Nat. Ornith. Bull., April, 1878.)

Somateria mollissima, Eider Duck.—Two specimens in immature plumage were taken on Long Island Sound near Flushing in the winter of 1877.

Stercorarius pomatorhinus, Pomarine Jaeger.—One specimen

shot by a frier, d Sept. 19, 1872, at Rockaway, and kindly presented to me. It is rather strange that in the fall of 1872, the Jaegers were very numerous at Rockaway, making their appearance in the last of August and remaining until the middle of October, and never before that year or since have I seen a single specimen.

Stercorarius parasiticus, Parasitic Jaeger.—The specimen here noted I found at Rockaway washed up by the sea in the fore part of June, 1873. The bird was very much decomposed, but sufficiently preserved to identify the species.

Rynchops nigra, Black Skimmer.—A pair of fine adult specimens were shot by a gunner at Rockaway, July 26, 1876, and presented to me. These with two others observed flying over the Bay Sept. 3, 1876, and one young bird procured in Fulton Market, are the only specimens that have been noted in a number of years, and yet Mr. Geo. N. Lawrence informs me that twenty-five years ago the Skimmers were very numerous on the south side of Long Island, and particularly in the neighborhood of Rockaway.

Olbymus septentrionalis, Red-throated Diver.—Two specimens noted, one taken by myself at Rockaway, Sept. 19, 1872, the other by Mr. Robert Lawrence in Flushing Bay, Oct. 11, 1877. Both of the above are adult birds. In this plumage it is rare, although the young are frequently shot in this vicinity.

Uramia larda, Razor-billed Auk.—Mr. Robert Lawrence informs me that he has in his collection a fine female, taken by a gunner at Centre Moriches, March 5, 1878, while decoying ducks. The man had fallen asleep in his blind, and on awakening found the Auk snoring itself within a few feet. It was very gentle, and was secured while swimming slowly away.

Mergus alle, Little Auk.—On the 10th of Jan., 1878, at Centre Moriches, a specimen was found half a mile back from the Bay in a piece of woods; it was still alive but unable to fly. The bird had probably been driven ashore by the storm of a few days before, as they have been quite numerous on the coast this winter.

NOTE.—We have the pleasure this week of presenting to our readers an extremely valuable paper on some of the rare birds of Long Island. The notes are communicated in a paper read before the Linnean Society of New York, by Mr. N. T. Lawrence, and are especially important in that they record the capture of two species never before taken on Long Island, we believe. Ornithologists and collectors will read this communication with great interest.

THE GRAY PARTRIDGE (*Perdix cinerea*)

Mr. John Swainson, of St. Paul, Minnesota, has called our attention to a game bird found in Sweden—the gray partridge (*perdix cinerea*)—which, he believes, if introduced here, more especially in the North, would be admirably adapted to our climate. Mr. Swainson has some objections in regard to the European quail. In England, where they were introduced some eighty years ago, they are not held in public favor on account of their propensity to run and skulk in the grass as soon as the dogs are on their track. With the gray partridge, our correspondent states, no such trouble would be found. As we have some friends in Sweden, we have written to them on the subject of this particular bird, which is found in winter in Northern Europe, and in due time we will be glad to give sportsmen full information as to the cost of birds and charges of importation. Mr. Swainson has written to us the following letter:

ST. PAUL, March 13, 1878.

EDITOR FOREST AND STREAM AND ROD AND GUN:

I have followed with great interest the initiatory steps taken by Judge Everts and Mr. Hapgood to introduce into this country the European quail. Certainly these gentlemen deserve not only the thanks of the whole sportsman's fraternity, but every assistance and co-operation to promote their very praiseworthy enterprise. I am glad to notice in your paper that several other sportsmen have taken measures for the importation, on a still larger scale, of this interesting game bird; and I have reason to hope that another season will see at least 1,000 of these lively little fellows planted in the Upper Mississippi valley, from which, in their yearly migrations, I think they will not much diverge, having a large water-course as a guide and a continent to their right and left before they are able to try the experiment of crossing an ocean, while the Gulf States offer them for winter quarters a climate as semi-tropical, or nearly so, as that of Northern Africa, their most southern winter home on the other side of the Atlantic.

While this is certainly a move in the right direction, there is another game bird of Europe, to which I wish to call attention, and the introduction of which into this country would, I feel confident, not only succeed, but give us one of the finest game birds in the world, in several respects far superior to the game quail. The gray partridge of Europe (*perdix cinerea*) resembles in habits and habitat very much our beloved "Bob White," while it differs from it in size, which is fully twice that of its American cousin, and, in plumage, a fine bluish gray mottled with brown. In habits it is stationary, even during the winter, being always found within a small circumference from the place of its birth. This may, to some, seem an objection to its introduction in the utmost northern part of this country, where one might suppose it could not exist on account of the severity of the winters, but it is a hardy bird, and in Northern Europe it is found in abundance as far north as lat. 60. In Sweden, for instance, it abounds near Stockholm, Upsala, and the shores of Lake Malaren, where the climate is certainly fully as severe as in Vermont or New Hampshire. But a condition for the existence of this bird is that there are no farms on which you will never find cultivation. It is, *par preference*, the bird of the stubble-field, the potato and turnip-patch. In cold and stormy weather, it will take shelter under hedges and in nearest brushland, and after a snow-storm you are pretty sure to find them on the sheltered side of the grain-stack or under the barn or stable, where, if hospitably treated, they are very apt to remain all winter in a semi-domesticated condition, and will amply compensate such kind treatment by raising their broods in nearest pensate such kind treatment by raising their broods in nearest grain-field, and there, in proper season, the farmer or his friends will find from each pair of the previous winter a bevy of from 10 to 24 birds, affording a most exquisite sport and a delicious dish for the table. They lie well for the dog, and are in this respect far preferable to the European quail, which is a great runner, and often gives both sportsman and dog a

good deal of trouble. But the partridges rise with great noise, and, once started, are very quick on the wing; so, my young and somewhat excitable sportsman friend, let me tell you there is such a thing as now and then missing a bird, and if ever you get a side-shot at a European partridge, aim fully as much about as on a ruffed grouse.

The writer wishes to fix the attention of our enterprising sportsmen to this bird, and feels no hesitation in predicting that if once introduced into this country and properly protected, it would multiply all over the continent and give us a game bird, the superior to which is not found either here or in any other country.

J. S.

BIRDS TOWERING.

EDITOR FOREST AND STREAM:

The very interesting and instructive notes I have seen in the FOREST AND STREAM, relative to towering birds, move me to narrate an experience of my own touching the subject referred to:

In January, 1861, I was hunting in one of the river parishes in Northeast Louisiana. We had had excellent success, and killed quite a number of deer and the largest panther I ever saw or ever wish to see. It was about three o'clock in the afternoon when I came to the cornfield of Dr. Adam Bowie. There were, perhaps, a thousand acres planted in the great American cereal, and the stalks were immense, nearly fourteen feet high, having grown with the luxuriance characteristic of the plant on the lowlands of the Mississippi. My dogs flushed an immense flock of wild turkeys out of the corn. They flew away heavily into the forest and alighted in an immense oak tree about 150 yards from where I was sitting on a log by the plantation fence.

I was carrying an excellent rifle, made by Frank Wesson, of Worcester, Mass. Of course it was a muzzle-loader (at that time we had no other) with a thirty-inch barrel of steel, carried a half-ounce round bullet, and weighed about 10½ pounds. I have owned a great many excellent rifles in my time, but have never had one which possessed such extraordinary accuracy, combined with long-range qualities. With it I shot a swan on Swan Lake, Ark., nearly a quarter of a mile away.

But to return to my story. The turkeys were very large. There was one in particular, an old gobbler, as I could see by his beard, which was sitting on the extreme end of a dead limb in the top of a tree. I took a rather coarse sight at him and fired. The whip-like crack of the rifle made the echoes ring again, and the startled birds flew in every direction. The turkey I had shot at acted most singularly. He stretched himself up to his full height, which was almost five feet, and then started to fly toward the cornfield instead of away from it. About fifty yards from the tree he commenced to tower, and in a circle he ascended nearly a quarter of a mile high. I should think, when suddenly he began to turn over and over in the air, and fall. With precisely the same movement as is made by a wild duck with both wings broken, he fell, about seventy-five yards from where I stood watching him, perfectly dead. The bullet had gone directly through the body just below the wing points, and an inch from the heart.

This was much the largest wild turkey I ever saw. He weighed, when dressed and ready for the spit, 27½ pounds, and the fat was an inch thick on his back. I have frequently seen wild turkeys tower, but never witnessed such a remarkable case as the one I have described above.

Washington, April 6, 1878.

BLUE BIRD VS. SPARROW.—Our correspondent, Mr. E. B. Gleason, writing from Elmira, is an admirer of the sparrow, and gives us an interesting account of a battle between blue-birds and the foreigners, in which the latter were worsted and driven from their home. Mr. Gleason says:

"A lady friend, who is quite an observer of birds, tells the following incident in regard to the birds in question, which so corroborates my views that I send it to you. She built a little sparrow house in her yard near the window, and in a day or two it was taken possession of by a pair of sparrows, who began at once to build their nest. When two or three days had elapsed, during which time they had carried in a great deal of building material, as is their habit, along came a pair of blue birds (*S. sialis*) and take it into their heads to possess the house and nest of the sparrows, which they do, after a hard fight. The meek little sparrow is like some quiet people—when he is mad he is awful mad. The fight lasted some time, but at last the bluebirds came off best, and now occupy the house; but the sparrows still come around ten or a dozen times a day, when a little skirmish ensues, in which they are worsted. So much for the sparrows driving other birds away."

A good many friends of the sparrow seem to be speaking up just now. Here is a newspaper clipping which says that a flock of bluejays attacked and defeated eighty English sparrows that were turned loose in a park at Dubuque.

BREEDING OF FOXES IN CAPTIVITY.—Terryville, Conn., April 18.—Editor Forest and Stream: Mr. C. T. Grinnalls, of this place, has succeeded in raising a litter of young foxes, a feat which the traditional oldest inhabitant says he never "hear'n tell on afore." The old foxes were captured about a year ago in the town of Warren and are kept confined in a large cage, which gives them more liberty than when chained, as is usually the case. The young ones, four in number, are about two weeks old, and are doing nicely. Is this a common occurrence, or is said ancient inhabitant correct in regard to the rarity of foxes breeding in confinement?

W. B.

[We think that O. H. is quite in the right, and that the breeding of foxes in captivity is very unusual. Wolves, however, are known to breed occasionally in zoological gardens.—Ed.]

THE LINNEAN SOCIETY.—This society has now adjourned to June 1st, when the last meeting will be held before the members separate for the summer to reassemble in September or October. We shall look forward with interest to the reports next fall of the summer's work.

JORDAN'S MANUAL OF THE VERTEBRATES.—We are glad to be able to announce that Prof. Jordan's Manual of Vertebrates has had a most successful sale, and that a new edition is promised shortly. This new edition is to be much enlarged and will contain over 400 pages. An important addition to the work

is a full bibliography. That portion of the work devoted to the fishes has been entirely rewritten and will be especially full. A synopsis of the North American *Salmonidae* has been inserted. Another new feature of the work will be a full series of definitions of specific, as well as generic names. We shall look forward to receiving this work with great interest.

CRIMES OF THE CROW.

POTTSVILLE, Pa., April 16, 1878.

EDITOR FOREST AND STREAM:

In a recent talk with a suburban farmer on the habits of the crow, the following is the opinion delivered by him, which may be of interest to the readers of the FOREST AND STREAM at this season of the year:

Q.—Is not the crow a friend of the farmer?

A.—I think I am reasonably well acquainted with the habits of the crow, and I haven't the first word to say in his favor, and candidly express my opinion that he is a nuisance to the farmer.

Q.—Why do you denounce him?

A.—Because he will destroy the various products of the farm. He will carry off all the eggs of poultry that he can find, also the eggs and young of the insectivorous birds. If he does not, why do birds fight or chase him away when they are rearing their young, and at no other time? That is sufficient proof that he is an enemy to them.

Q.—Does he not destroy the grub-worm and other insects that injure the crops?

A.—He does no such thing. I admit that he will eat grubs (as they are called) in the spring of the year, because he is compelled by hunger, owing to the scarcity of food. He will not destroy the out-worms that eat the corn off about the time it is coming through the ground, because he can find other food that he prefers, such as eggs and young birds. I have seen him time after time light down behind the mowing machine on which I was sitting and pick up a young bird and carry it off to feed his young, and return in a few minutes in search for more. Nearly my whole life has been devoted to farming, and I have the first time yet to find the crow taking the worms out of the hills of corn. But I have seen him taking the corn out, perhaps intending, when he starts, to get a worm, but whether he does or not, he always makes it a rule to get the corn.

Q.—Is the crow-blackbird (as it is commonly called) of similar nature?

A.—He should have the same reputation as the crow, for he is a destroyer of the smaller birds, going to their nests and taking out the eggs or young, whichever it happens to be, and eating them. They have become so numerous that it is almost impossible to get any of the early cherries, because, from the first time the cherry begins to turn red on one side, they begin to eat them, biting the red side only. They also destroy a great amount of corn in the fall before it is cut up into shocks. It is not what they eat, but they pick the husk loose from the end of the ear, so that the ear takes water during a storm, and the consequence is, when you go to husking, you find that the ears which have been plucked by these birds are black at the end, and the ear is generally mouldy all the way down.

DEM PEDRO.

SALMO FONTINALIS IN TEXAS.

HOUSTON, April 22, 1878.

EDITOR FOREST AND STREAM:

Some time since you wrote me, asking if *salmo fontinalis* was found in Texas. I replied that I had never seen it, but had little doubt of its existence in the Pan Handle region of Texas. Since I wrote you I have been perigrinating considerably, and am still doing so. At Palestine I met with Dr. H. I. Hunter, a scholarly and accomplished gentleman, who was a Confederate surgeon during the war, and for some time established at Fort Davis. He told me that he found a fish that he took to be *Salmo fontinalis* quite numerous in the Limpia, and in the streams north of that they were abundant. He had never seen this fish before, but entertained no doubt at all that it was the true speckled trout. The Limpia flows through a region about 5,000 feet above the sea, whose mercury rarely rises above seventy-five, and the creek itself is as clear as sunlight. I have no doubt the officers at Fort Davis would give you information of this fish. A buffalo hunter, just from the Pan Handle, told me that he could catch the speckled trout by the wagon load in all the streams of that region—the head waters of the Canadian and Red Rivers. "The only difference," said he, "between this trout and the trout of the North is that the spots on this one are bigger and bluer." Maj. D. W. Hinkle, who was with Emory's Boundary Commission, and whose acquaintance I formed here, says the buffalo hunter is about right. He has been all over the Pan Handle. I am convinced that you are right in your Gazetteer.

N. A. T.

ANIMALS RECEIVED AT CENTRAL PARK MENAGERIE FOR WEEK ENDING APRIL 20.—One yellow-faced amazon, *Chrysotis xanthops*, presented by Mrs. Richard P. Dana, N. Y. City; one horned owl, *Bubo virginianus*, presented by Mr. William A. Day, N. Y. City; two wild geese, *Bernicla canadensis*, presented by Mr. John Sutherland, N. Y. City; one giraffe, *Camelopardalis giraffa*; two angora goats, *Capra hircus*. W. A. CONKLIN, Director.

ARRIVALS AT THE PHILADELPHIA ZOOLOGICAL GARDEN FOR WEEK ENDING APRIL 24.—One gray fox, *Urocyon virginianus*, presented; three alligators, *Alligator mississippiensis*, presented; two horned toads, *Bufo cornutus*, presented; one catbird, *Mimus carolinensis*, presented; one robin, *Turdus migratorius*, presented; one opossum, *Didelphis virginianus*, presented; one kingfisher, *Ceryle alcyon*, presented; one pied-billed grebe, *Podilymbus podiceps*, purchased. ARTHUR E. BROWN, Gen'l Supt.

—Anglers will notice that Mooshead Lake is now available for trouting.—[Adv.]

—Why increase your sporting expense by using paper shells when the objections to the use of metal shells is entirely removed by the use of Roman's Metal Shell Cleaner?—[See adv.]

McBRIDE FLIES.

Every fly that was left for sale with W. Holberton, of the Sportsmen's Emporium, I removed from his store. He has no McBride flies as his advertisement. None are sold to the trade. S. J. McBRIDE.
169 Broadway, N. Y. City.

THE BOSTON BOATS.—The Fall River Line of Boston steamers have issued a very pretty little vignette, on which is an excellent likeness in colors of one of their world-renowned palatial steamers, and announcing the reappearance of the Bristol and Providence upon the route for the summer season. The rates of fare will remain at the extremely low figures of the past, \$3 either way and \$5 for an excursion trip, music by Hall's famous band thrown in.

Woodland, Farm and Garden.

THIS DEPARTMENT IS EDITED BY W. J. DAVIDSON, SEC. N. Y. HORTICULTURAL SOCIETY.

SYNOPSIS OF A LECTURE ON PRUNING AND TRAINING FRUIT TREES.

GIVEN BY MR. A. BOILEAU AT THE MARCH MEETING OF THE NEW YORK HORTICULTURAL SOCIETY.

WE believe the following will be instructive and useful to those interested in the cultivation of fruit trees, as Mr. Boileau says the art of training them is but little known in this country, and certainly one would have to go far to find such trees as he has in his city garden, and we doubt much if there is another garden in the States where there is so much taste displayed in the training of the different forms of apple and pear trees, showing fully the advantage of such treatment for ornament, as well as for the abundant production of choice fruits, because trees treated as he manages them cannot fail to produce liberally every season. For the formation of the pyramidal pear tree, he said every year the leader must never be pruned longer nor shorter than from fourteen to fifteen inches, with care that it should be so pruned that the cut of this year should leave the eye opposed to that of the previous season; for instance, if last year it was pruned with the eye facing the south, it should be left facing the north this year. This is to keep the stem straight, and each year never to have more nor less than five branches on the leader of the tree. If more grow they should be cut off, and if there are less an incision should be made above the eyes that are wished to be developed. This operation will stop the flow of the sap at that point and cause the eyes to start and grow vigorously, care being taken to have the five new branches interposed between the five branches of the previous year. This is done so as to give space between the branches, to allow the air to circulate freely into the interior of the tree. This is very easy to understand, as any one can see on the few specimens he has on his place. You can see where the leader was pruned every year, one year on one side, the following on the other, and so on to the top of the stem, which is about ten feet high, with about eight series of branches, five in each, and all interposed between each other. The effect is beautiful and ought to be seen by every one who has a few fruit trees on his place, so that he might acquire the knowledge to treat them for the advantages of ornament and choice production as above. These stem branches (if we may so call them) he terms "frame branches," and they are trained obliquely from the stem of the tree so that they should not be so near each other. The branches growing on these are named laterals, and on the good treatment of these depends the success of the crop of fruit. To cause the formation of fruit buds they should receive the following treatment: In June, when the young laterals are about seven or eight inches long, they should all be pinched back to the fifth or sixth leaf from their base, and at the end of August or beginning of September again pinched about an inch above the first. The result of this second stopping being that at that season of the year when the flow of the sap has nearly stopped, the dormant eyes between the first and second pinching do not receive sap enough to develop themselves into branches, but swell and form spurs, which are the formation of fruit buds; and further, the sap that would flow into the useless branches should they not be removed goes into the fruit, causing them to grow much larger, at the same time allowing the air to circulate more freely through the tree, and the sun to shine on the fruit, giving them more flavor and color; whereas if there was no pinching done in summer, the fruit would be less in number, smaller; and, being constantly shaded, would have no color and but little flavor, and at pruning time much redundant wood would have to be cut away, and in consequence there would be very few fruit buds on the laterals. For the formation of espaliers, he said that when the tree has been planted one year and has well-established roots, as with the pyramidal or any other form, the young tree can be pruned back with certain success of fine and vigorous development. It ought to be cut about eight or ten inches from the ground, on the one eye which faces you, and which will of course form the leader; and just below select two eyes opposed to each other, one on the right and the other on the left; these two branches are to form the base, and should be trained obliquely so as to allow them to grow vigorously, and in July, when the leader is strong enough, cut it back always on the eye facing you, at about one foot from its base, care being taken to select two eyes for the formation of the second series of branches that should correspond with the two of the base. For instance, if, on the first year of pruning, the branch you obtained on the right side of the tree is above that on the left side, it must always follow in the same manner afterward to establish regularity, and when the trees are vigorous two series of branches can be had every season, one at pruning time and one in summer, as can be seen on the specimen trees in his place.

Mr. Boileau has promised us to say something further as to his methods of training the more fancy forms, such as his fountain vase and candelina shapes, and also about grape vines, which he recommends not to be pruned long, as most people do, and also never to be trained vertically, but to prune the young shoots when about thirty inches long, and train them horizontally so that all the eyes on the young shoots may be developed. The cultivation of the grape vine is so interesting to most people that he has promised us a special article on his method of pruning and training it.

We have much pleasure in stating further that Mr. Boileau has also distinguished himself in the decoration of halls and churches, in grouping plants with trees, etc., as he did last year at Neilson Hall on the occasion of the Martha Washington reception, where the different nations were represented with plants of their respective climates; and only those who have seen his grouping at Trinity Church on festival occasions can judge of his taste in this particular. The planting of Trinity, St. Paul's and other church yards on Broadway is also under his supervision, and for the good and advancement of the beautiful in nature, as well as in art, we trust he will keep it up to the high standard he has already obtained.

BUFFALO CROSS BREEDS.—Houston, Texas, April 22.—Maj. D. W. Hinkle, of the Emory Boundary Commission, has told me that a wealthy stock-raiser in Coleman County, Texas, named Merchant, has a number of calves, the product of

buffalo bulls and the domestic cow. He had seen them and pronounced them very poor stock. He says both the buffalo and the cow are debased in their offspring, and that an uglier animal can hardly be found—long, lank, lean, hairy and stupid. He does not believe that our beef stock can be improved by mixing with the buffalo. He also believes that these crosses may prove mules; that is, impotent to propagate their species. But this is conjecture. The hybrids he saw were not quite a year old. In my little book, "Two Thousand Miles on Horseback in Texas," I stated that I had never seen a cross between the buffalo and domestic cow. In this I was mistaken, but had forgotten the fact. In the county of San Saba, in 1858, I saw a cross of this kind that was between two and three years old. It was indeed an ugly beast; long, lean, lank and slouchy; the ugliest of the cow kind I ever saw; but it certainly was a great improvement in bone and frame, and if it would take on fat I cannot see why it would not be an improvement in beef. I consider the question still an open one, with the chances decidedly against the improvement of our cattle by putting a dash of buffalo in the blood. Would our white race be improved by a mixture with the big, wild Comanches? Greatly improbable. N. A. T.

The Kennel.

TO CORRESPONDENTS.—Those desiring us to prescribe for their dogs will please take note of and describe the following points in each animal:

1. Age. 2. Food and medicine given. 3. Appearance of the eye; of the coat; of the tongue and lips. 4. Any changes in the appearance of the body, as bloating, drawing in of the flanks, etc. 5. Breathing, the number of respirations per minute, and whether labored or not. 6. Condition of the bowels and excretions of the kidneys, color, etc. 7. Appetite; regular, variable, etc. 8. Temperature of the body as indicated by the bulb of the thermometer when placed between the body and the foreleg. 9. Give position of kennel and surroundings, outlook, contiguity to other buildings, and the uses of the latter. Also give any peculiarities of temperament, movements, etc., that may be noticed, such as snuffing, etc.

FIXTURES FOR 1878—BENCH SHOWS.

The Westminster Kennel Club (New York) Bench Show, Gilmore's Garden, May 14, 15, 16 and 17. Dr. W. Seward Webb, Secretary.

BALTIMORE KENNEL CLUB.

THE BENCH SHOW.

BALTIMORE, April 25, 1878.

With a very full attendance both on Tuesday and Wednesday, to-day Masouie Temple has been fairly crowded, and many Baltimore ladies were present. Baltimore journals pay but a very limited attention to field sports, and though within a few miles of the city many a fox hunt has its meet, such matters are hardly noted. Baltimore ladies have inherited from their mothers and grandmothers a love for fox hunting, and many of them are cool and daring fox hunters, and when the brush is in view are regardless of their necks. All these fair women have their pets among the kennels, and when at the last Bench Show all their favorite fox-hounds unfortunately were not the recipients of prizes, their ire was immense. No man ever could reason with a woman as to her dog, and the expression, "Love me love my dog" (providing Darwin will allow that there was a cur in Paradise), must have originated with Eve.

It was with the native English setter-dogs that we must confess we had the greatest interest. Taken all together they were a fairly good lot, but they did not compare as a whole with the same class exhibited in Boston. The discrimination exercised by Mr. Davidson was excellent, and in some twenty-eight dogs, Dr. E. R. Baer's Don, a fine orange and white, was clearly the winner. Mr. E. P. Welsh's St. Cloud, of the Rob Roy and Sherwood's Nellie stock, ran Don very closely. Among the best dogs were Jeff, belonging to the Chicago Kennel Club, and Mr. Hiner's Zac with Spot, owned by Mr. T. Denmead. Dick and Chance were also worthy of particular mention, all these dogs coming in for a V. H. C. Of the setter bitches, Mr. Frank W. Thomas' Fanuy won the blue, being a very perfect and thoroughlybred creature. Mr. B. E. McClenahan's Fleet, an orange and white, was a close second. In the puppy class, there were numerous likely animals. Brutus, owned by Mr. J. O. Higgins, was first. In the bitches, Aribel, bred by Mr. T. C. Higgins, of Delaware City, was a perfect beauty. In class 7, imported Irish setter dogs, Mr. Ogilvie's Ben had it by long odds, and Mr. Brown's Grimsa was second. In the Irish setter bitches, though Mr. C. Z. Miley's Floss was a pretty one, Mr. Gause's Fire Fly, which was a V. H. C. in the champion class, was the winner. In native Irish setters the whole collection was fairly good, Mr. Ogilvie's Ben, the winner of the champion class, taking it easily. In bitches, Mr. Weighell's Breeze, an H. C. before, took the blue. In Gordon setter dogs, Mr. R. N. Elder's Rapp was first, and Mr. Miller's King was second. In this class, to show how good these were, in 12 dogs entered, three of them not competing as belonging to the Baltimore Kennel Club, 8 dogs had merit awarded to them. In the bitches, Mr. Weighell's Belle was first, and Queen, of the Goldsmith Kennel Club, second. Among the very choicest dogs we may cite Mr. Tilley's fine Whip, which bitch also had an honorable mention in class 3. Almost without an exception the entire classes of Gordon setter puppies were good. In class 10, pointer dogs, Mr. J. N. B. Latrobe, Jr.'s, Bounce was a wonderfully well made dog, and took the blue. Mr. S. C. Magraw's Major Elliott was a fine second. The V. H. C's were well merited, among them was Mr. J. K. Bramble's fine pointer, the No. 210. Mr. Bramble, of East Newmarket, Dorchester County, Maryland, is a thorough, practical sportsman, and his dogs and method of training them are well known to us. In pointer bitches, Mr. Orgill's Romp, a one-year-old lemon and white, was winner. In class 11 (pointers under 55 lbs.), Mr. A. P. Bauer's Captain took the blue, and Mr. J. Lynch's Rapp, with the Seausation blood in him shining all over, was the winner of the red. In bitches, Mr. Orgill's stock carried off first and second with Ruby and Belle. In pointer-dog puppies, Mr. A. V. Canfield's Tuck was a fine winner. Tuck getting also the special in class 64. In Chesapeake Bay dogs, a great deal of interest is placed. If it is not in Baltimore that these truly American dogs are to be discovered, it is a question where they are to be found. We find that in Baltimore a great diversity of opinion still exists. The question of what is the true

"A friend of mine used a small rubber band on his dog's nose, to teach him to hold things in his mouth with great success."

We think there is little trouble in teaching any animal to retrieve. With dogs, when a person has patience, it can easily be accomplished. Almost as soon as a puppy can toddle he can be made to understand that he must go for an india rubber ball. He mostly will do it of his own accord. It is best at first to roll it quietly with the finger on the floor, and after a while to bounce it. The moment it rebounds any puppy will show delight and try to get it. A little chiding will soon make a young dog drop the object he holds. Stead-

fastness in holding something in the mouth is what takes longer time to teach. We do not like spike collars, and have no hesitation in saying so, and only believe that retrieving can be taught by their use in extreme cases.

ROSE TREE FOX-HUNTING CLUB.—The spring meeting of this club, takes place next week, Saturday. The programme includes a parade of the club in hunting costume, hurdle races, etc.

PALMERSTON II.—Some of our readers wishing to know the pedigree of Palmerston II, Mr. John M. Niall, of Killaloe, St. Clair, Ireland, sends us the following:

"Palmerston II., by Dash, 1st prize and cup, Dublin, 1875, ex Nell, 2d prize, Crystal Palace, London, 1875. Dash, own brother to Champion Palmerston, is by Mr. Cecil Moor's Old Shot, ex Mr. Moor's Kate (1st prize and cup, Manchester, 1871), when she was ten years old. Old Shot is by Mr. B. Evans' Grouse, ex Mr. Hummington's Juno. Nell, own sister to Lilly II., for whom Purcell Clowell, Esq., gave £150, and Ellie, both 1st prize winners at Crystal Palace and Birmingham, in 1872, 1873 and 1874, is by Major Cooper's celebrated Ranger, so well known as a great prize winner, for winnings see K. S. B. 1749, ex Mr. Jephson's Belle, K. S. B. 1711. Ranger by the world renowned Hutchingson's Champion Bob, K. S. B. 1700, ex Hutchinson's Lilly. Bob by Dash ex Quail, Belle, by T. V. Nugent's Don, ex Mr. Wallace's Dove. Dove by Grouse II. ex Flu, won 1st prize, Crystal Palace, London, and 1st prize Birmingham Show. Bob (Champion K. S. B. 1700), is by Dash ex Quail. Dash is by Mr. La Touche's Ranger, who was sold by auction at Dyer's for £73 10s., ex Judy; Judy by Captain Goff's Dash, ex Fan. Palmerston has already won five prizes. He is 25 inches at shoulder, rich in color, with a profuse glossy coat without white, save a very small spot on the chest.

Far back the pedigree of Palmerston II. is traced from Ledwich's old red Irish setters, now almost extinct.

GOING AROUND BIRDS.—The habit of "circling birds" by pointers and setters is corroborated by a correspondent as follows:

"I see your correspondent, 'G. K. M.,' from Philadelphia, speaks of a peculiarity of his pointer bitch going around birds, and coming back to same place and pointing. I have an English setter bitch that has done the same thing several times. She only did it, however, when the birds had a tendency to slip off from her. On discovering their moving away from her, she always wags her tail a little, looks around to see I am on the look out, crouches almost to the ground, and creeps around them, making a complete circle, comes back to starting point, and stands, and the birds, after this dodge, almost invariably lie quiet as long as you wish. Yours, Huntingdon, Pa., April 10. T. C. FISHER.

WHELPS.—My imported cocker bitch Fan whelped, on the 6th inst., nine pups from Mash's prize cocker Dush. Hayville, Ont., Canada. W. A. H. A' COURT.

M. H. Brooks, Sec'y Greenville, Pa., Sportsman's Club, lost by distemper his valuable pointer dog Billy.

DEATH OF FLAKE.—We regret to learn that Mr. E. Orgill's champion pointer Flake died on Tuesday, 30th April, on his return from the Baltimore Bench Show. Flake was 3½ years old, had been the recipient of innumerable prizes, and was among the finest dogs in the country.

DISCRIMINATION IN SCENT.—*Lansing, Iowa, April 11.*—In your issue of April 11 I notice an article by J. H. H., headed "Discrimination in Scent." I endorse the views of this writer and believe it is a natural instinct of the true bird dog—setter or pointer—to distinguish the scent of live, dead or wounded game. While hunting pheasants last season in company with my friend John B., my setter dog Rover dashed a pheasant. I fired at it, breaking a wing, the bird falling at some distance out of sight. Rover started in pursuit, but not returning as soon as I thought he ought, I started after him. He had the bird coming in. Suddenly he came to a firm stand, still holding the pheasant in his mouth. We proceeded to the spot and found him standing a covey of quail some 20 or 30 feet distant, and not a bird in sight, they being in thick hazel cover. We succeeded in bagging 10, when we sat down and discussed the smelling qualities of the dog. C. A.

Rational Pastimes.

CRICKETERS' ASSOCIATION.—At a convention of the American Cricket clubs held at Philadelphia, April 15th, representatives were present from the following clubs: Baltimore, Belmont, Chestnut Hill, Dorian, Fall River, Germantown, Manhattan, Merion, Philadelphia, Staten Island, St. Timothy, University of Pennsylvania and Young America. "The Cricketers' Association of the United States" was organized, and the object of the body set forth as the advancement of the Cricket interest in the United States. This is one of the most important Cricket meetings ever held in this country, and we may infer from the full representation of clubs a growing interest in the manly game. Among the more noteworthy rules adopted by the association was one relating to what is known as revolving, which reads as follows: That no player be allowed to play in matches with more than one club in the association, during the season, unless he shall actually have resigned from one club and joined another; but undergraduates of colleges may play with one other club besides their college club. The rules of the Marylebone Cricket Club were adopted as the laws of the association, with some modifications, which were specially recommended for trial during the year.

CRICKET.—The Australian cricket team arrived in San Francisco, last Sunday, per steamer City of Sydney. The following are the names of the players: T. Horan, W. C. Gibbs, H. Boyle, C. Bannerman, A. J. L. Munn, W. L. Murdoch, F. Spofford, F. Allen, F. Bailey, J. Blackham, G. Garrett, A. Candide and D. Gregory.

MANHATTAN CRICKET CLUB.—At the Prospect Park match last week the following score was made:

ORIOLE'S SIDE.		JACKSON'S SIDE.	
Greig, c. Lawler, b. Jackson.....	4	Jackson, b. Hooper.....	2
W. Scott, b. Rogan.....	3	Rogan, c. Edwards, b. Scott.....	14
G. Scott, b. Jackson.....	2	Edwards, b. Hooper.....	10
Haasling, c. G. Scott, b. Jackson.....	1	Lawler, c. Rogan, b. Greig.....	10
Gowdy, b. Rogan.....	2	Cumman, c. Rogan, b. Hooper.....	2
Jepson, c. Lawler, b. Jackson.....	1	Hooper, not out.....	0
Garrity, not out.....	1	L. Love, c. Gowdy, b. Greig.....	4

Byes, 4; leg byes, 1; wides, 1.....	6	Wides, 1; leg byes, 1.....	2
Total.....	30	Total.....	30

FOOT BALL.—An exciting and closely contested game of foot-ball at Prospect Park, Brooklyn, last Saturday, resulted in a score of 4 goals for the Polytechnic Foot-ball Club, and 3 goals for the Juvenile High School Club.

"BATING THAT O'LEARY."—John Hughes, who started out April 21 on his long walk to beat O'Leary's time of 520 miles in 5 days, 19 hours and 10 seconds, finished his attempt last Saturday evening. When the word was given the first day Hughes bounded off on the run, and kept it up for 3 hours and 44½ minutes, making in that time 30 miles. At the close of the 24 hours, 100 miles were put down to his favor, and then both amateur and experienced pedestrians knew that his attempt would be a failure. He was then 17 miles behind O'Leary's time, and the record after that time may be learned from the following table of the miles gone over at the end of the days:

	O'Leary.	Hughes.
Second 24 hours.....	200	169
Third 24 hours.....	288	223
Fourth 24 hours.....	373	293
Fifth 24 hours.....	456	354
Sixth day, 10h. 4m. 10s.....	1,270-1,320ft.	850-8,455ft.

—In the Paterson, N. J., Wigwam, Capt. John H. Milligan, of that city, and Miss Paulina Von Saulsburg, of New York, started at 10:15 Friday morning for a 36 hours walk without rest, or stopping for food or drink. At 10:15 Saturday night the pedestrian threw up the sponge. Milligan walked five minutes longer and was declared winner. He walked about 80 miles.

THE LONG DISTANCE CONTESTS.—The entries for the twenty-four hours amateur walk, and the thirty-six hours professional walk close next Saturday. There are a large number of competitors already registered for the competitions, and a fine record may be expected. The contests are appointed for May 10 and 11, at the Rink, this city.

ONE HUNDRED MILES.—W. E. Harding, the fifty mile champion of America, and John Ennis, of Chicago, who recently covered 400 miles in 128 hours at Buffalo, are to walk a match of 100 miles, and also for the two miles champion-ship, at New York, June 8.

—C. A. Davenport and T. Allskey, amateur pedestrians, walked a match of ten miles at the Scottish-American grounds, last Saturday. Davenport made it in 1hr. 47min. 27s.; Allskey in 2hr. 2m. 6s.

—A four mile walk at New York, last Saturday, was done by James Fay, in 46 min. 4 s.; his competitor, James Maiu, doing the same in 44 min. 15½ s.

—John Ennis, the Chicago pedestrian, accomplished his 400 mile walk in 128 hours, having ten minutes to spare, at Buffalo, N. Y., last Saturday.

—O'Leary, the pedestrian, at Dublin, Wednesday evening of last week, completed a walk of 220 miles in sixty hours.

ANOTHER MAN TO WALK AROUND THE WORLD.—Yesterday James Duff Henderson of Toronto, Can., started to walk a distance equal to the earth's circumference. He proposes to cover forty miles each secular day for two years, walked in the United States, Great Britain and the Continent, and is to receive \$10,000 if he accomplishes his task.

SOHMEILL VS. BARTLETT.—The walking match between these two pedestrians at Cincinnati, resulted in a victory for the former, who walked 400 miles in 119½ hours.

FAST TIME IN ENGLAND.—The following remarkable time was made by R. Hancock of Hackney, Eng., and W. Howes of London, in the recent 50-miles race at Agricultural Hall, London. We give the time for the last ten miles:

Miles.	Howes.	Hancock.	Miles.	Howes.	Hancock.
40.....	6 16 50	6 19 30	46.....	7 17 13	7 19 49
41.....	6 27 40	6 30 21	47.....	7 28 24	7 30 19
42.....	6 38 22	6 41 8	48.....	7 37 35	7 40 13
43.....	6 49 12	6 51 40	49.....	7 47 45	7 50 13

45.....	7 7 25	7 0 52			

A MUTE'S FATE.—A deaf mute, Martin Brown, at the New York Institution of the Deaf and Dumb, was fatally injured while competing at hammer throwing with a number of companions last week. Brown was alone near the goal, with his back to the thrower. The mutes watching the hammer as it flew toward its destination saw the danger Brown was in, but were powerless. The hammer went swiftly downward, and the mutes dashed forward. It fell with force, striking Martin Brown on the head, hurling him unconscious some feet away. His skull was fractured, and he lingered until the following day. Brown regained his speech before he died. This is attributable mainly to the shock to the brain. Brown became deaf and dumb in consequence of scarlet fever, at the age of six. Instances of recovery of speech following accidents to the brain are on record.

TRINITY COLLEGE ATHLETIC ASSOCIATION.—An Athletic Association has been formed at Trinity College with the following officers: Pres., W. N. Elbert; Vice Pres., S. G. Fisher; Sec., A. T. Mason; Treas., D. B. Wilson; Field Marshal, W. E. Potwine; 1st Lieut., S. G. Fisher; 2d Lieut., E. D. Appleton. It is proposed to hold a field meeting the latter part of this month. We are glad to chronicle the formation of another college club for manly sports.

APRIL BASE BALL.—The International Association game for the month of April have been characterized by uniformly good fielding. The single figure games have been as follows:

April 6, Harvard vs. Beacon, at Halesfield, 7-5; 11, Brown Freshmen vs. Fall River, at Fall River, 8-3; 11, Worcester vs. Beacon, at Worcester (6 in.) 7-6; Athlete vs. California, at San Francisco, 5-2; 15, Harvard vs. Live Oak, at Boston, 3-1; Cricket vs. Hornell, at Hornellsville, 4-3; Utica vs. Rusty, at Utica, 5-0; Manchester vs. Pittsfield, at Pittsfield, 2-1; 10, Hornells vs. Cricket, at Hornellsville (10 in.) 8-0; Rochester vs. Auburn, at Auburn, 5-1; Springfield vs. Holyoke, at Springfield, 7-3; 17, Utica vs. Rochester, at Utica, 6-4; Worcester vs. Madden Bros., at Worcester, 9-1; Buffalo vs. Essex, at Buffalo, 8-1; Yale vs. Trinity, at Hartford, 6-1; 18, Harvard vs. New Bedford, at Boston, 9-3; Hornells vs. Cricket, at Binghamton, 5-1; Rochester vs. Springfield, at Springfield, 7-0; Utica vs. Auburn, at Utica, 7-2; Allegheny vs. Zantha, at Allegheny, 3-3; 19, Hornells vs. Auburn, at Auburn, 6-1; Hudson vs. Madden, at Marlboro, 7-0; Haymakers vs. Amateur, at Meriden, 2-0; Tecumseh vs. Atlantic, at London, 4-3; Providence vs. Yale, at New Haven, 4-0; 20, Yale vs. Princeton Freshmen, at Princeton, 5-1; Lowell vs. Rochester, at Lowell, 5-0; Brooklyn vs. New Bedford, at Brooklyn (13 innings) 7-3; Manchester vs. Live Oak, at Lynn, 3-0; Utica vs. Cricket, at Binghamton, 7-3; Rosolite vs. Hibernia, at Elizabeth, 4-3; Holyoke vs. Springfield, at Holyoke, 5-3; Allegheny vs. Zantha, at Allegheny, 4-0; 22, Utica vs. Hornells, at

Utica, 3-2; Manchester vs. Rochester, at Manchester, 9-0; New Bedford vs. Pittsfield, at Pittsfield, 5-0; 23, Pittsfield vs. New Bedford, at Pittsfield, 5-0; Hornells vs. Springfield, at Springfield, 5-2; Star vs. Auburn, at Syracuse, 8-3; Athletic vs. Klenae, at Philadelphia, 5-3; Live Oak vs. Yale, at Lynn, 7-0; Amherst vs. Westboro, at Amherst, 7-6; 24, Brown Freshmen vs. Amateur, at Fall River, 5-3; Utica vs. Star, at Utica, 4-2; Cricket vs. Auburn, at Auburn, 9-7; Pittsfield vs. Westboro, at Pittsfield, 3-0; 25, Rochester vs. Live Oak, at Lynn, 3-2; Hornells vs. Lowell, at Lowell, 2-1; Star vs. Cricket, at Syracuse, 7-1; 26, Utica vs. Cricket, at Utica, 4-0; Springfield vs. Pittsfield, at Pittsfield, 3-0; Harvard vs. Manchester, at Boston, 5-3.

Sea and River Fishing.

FISH IN SEASON 1N MAY.

Trout, <i>Salmo fontinalis</i> .	Salmon Trout, <i>Salmo confinis</i> .
Salmon, <i>Salmo salar</i> .	Shad, <i>Alosa</i> .
Grayling, <i>Thymallus tricolor</i> .	Land lockett Salmon, <i>Salmo gairdneri</i> .

FLIES IN SEASON IN MAY.

BLACK MAY, No. 10.—Body, black; feet, black; wings, grayish hyaline.

COW DUNG, No. 10 AND 11.—Body and feet, brownish yellow; wings, yellow-gray.

GREAT DUN, No. 9 AND 8.—Body, purple brown; feet, gray brown; wings, dark gray hyaline; setae, dark brown annulated with gray.

RED SPINNER, No. 10 AND 9.—Body, bright claret, ribbed with gold tinsel; feet, brick color; wings, gray hyaline; setae, pale brick color.

YELLOW MAY, No. 10.—Body and feet, pale yellow; wings, pale yellow, mottled with brown; setae, yellow.

COACHMAN.—Body, peacock herl; feet, dark red hackle; wings, white.

KING OF THE WATER.—Same as queen of the water, with scarlet body instead of orange.

GOLD SPINNER.—Body, orange, ribbed with gold tinsel; feet, pale red hackle; wings, bright gray.

CAPTAIN.—Body, posterior half, peacock herl, anterior half, gray; white feet; red hackle; wings gray; setae, scarlet green and wood duck feathers mixed.

SOLDIER.—Body, crimson; feet, red hackle; wings, gray.

KINODEM.—Body, white, ringed with green; feet, peacock herl, and red hackle; wings, gray, mottled with brown.

Black Palmer, Brown Palmer, Red Palmer and Gray Palmer are made respectively of the different colored hackles that distinguish them.

FISH IN MARKET.—RETAIL PRICES.—Striped bass, 20 cents; large do., 12½; green smelts, 10; blue fish, 18; frozen salmon, 35; green do., 50; mackerel, large, 15; do. small, 8; native shad, 25; Connecticut River, 50; weakfish, 15; white perch, 15; green turtle, 12½; halibut, 15; haddock, 6; cod-fish, heads off, 6; do., heads on, 5; black-fish, large, 10; flounders, large, 10; do., small, 6; sea bass, 20; eels, large, dressed, 18; lobsters, live, 8; do., boiled, 10; sheepheads, 20; turbot, 20; scallops, \$1.50 per gallon; soft clams, per 100, 30; do., large, 60; whitefish, 15; pickerel, 15; salmon trout, 15; Long Island brook trout, \$1; soft crabs, per dozen, \$1.50; red snapper, 20.

THE NONSENSE ABOUT SHAD.—It takes so little to make a skeel! Now here is the innocent shad supposed to abound with the *trichina spiralis*, so as to be accounted a worse abomination than diseased pork. The story started a few days ago was somewhat as follows: That a doctor in Coytesville having observed sickness in his patients who had eaten shad, on examining the shad found that they abounded with *trichina*. At once, as impossible facts must be juggled in to bolster up stupid theories, New York Bay was supposed to be poisoned. Now it turns out that the Coytesville doctor never said at all that he had found trichina in the shad, but something like them. Dr. Apzell of the United States Army, a thorough microscopist, finds parasites in the gills of shad which were the ordinary *tricocephali* or pin worms, which are well-known and quite common in many fish. In fact, there is nothing in it at all, and people may eat shad with impunity, and soap their fingers at *tricocephali*, caryocysted perosperms even if they have bifurcated tails.

MASSACHUSETTS.—Brookfield.—The Podunk pounds pickerel fishing is furnishing famous sport, the town lease of these waters having now expired. It is estimated that over 600 pounds of fish were caught the opening day.

New Bedford, April 27.—The brooks hereabouts are in first rate condition, and quite large catches of trout have been made in seafishing, or rather trapping. A large amount of striped bass, tautog, scup, mackerel and rock bass are being taken daily in this locality. CONCORD.

MOVEMENTS OF THE FISHING FLEET.—The number of fishing arrivals reported at this port the past week has been 33, 25 from Georges and 13 from the Banks; 8 of the Bankers brought halibut fares, about 300,000 pounds in all, and 5 brought codfish, some 400,000 pounds. This is the first considerable receipt of Bank cod for the season. The receipts of Georges cod have been about 250,000 pounds. —*Cape Ann Advertiser, April 26.*

CONNECTICUT.—Meriden, April 28.—Mr. Watson E. Wilcox of Westfield, Conn., caught a brook trout last Thursday which weighed three pounds. He was placed on exhibition at the store of N. A. Roberts, Meriden, and pronounced the finest specimen ever taken from Connecticut waters.

New London, April 26.—Fishing in this vicinity is quite good now, but one should be armed with a bundle of permits to fish, as the brooks are well posted. MISAL.

Windsor, April 27.—Shad fishing this year in this vicinity is rather slim, and is so reported down the river. In four pulls of the seine at the mouth of the Farmington the following variety were taken: Shad, allwives, perch, suckers and one black bass, weight 2 lbs., one trout, weight ½ lb., and one

salmon, six inches long, which was put back into the river. Two miles below the Farmington, at one pull of the net, about 100 snappers were taken, the largest hait yet. **BALTIMORE.**

Winklettsville, April 26.—Largest recorded brook trout caught yet weighed 1 pound 7 ounces. Water a little too cold just now to be in good luck, as the fish seem to have very little life, and bite unusually weak on that account. **K.**

NEW YORK—Heldred, Sullivan County, April 27.—Mr. James H. McCorkle and friends have been here for several days, and had fine sport with the trout. **J. M. BRADLEY.**

"OLD CLOUD" DEAD.—Cloud Duclon, better known to all visitors at the Crossman House, Alexandria Bay, for the last thirty years as "Old Cloud," has gone the way of all good guides. For forty years he acted as guide, oarsman and friend, and many of our readers who may recall many summer days of enjoyment spent in his company, will learn with sorrow that the good old man has gone.

NEW JERSEY—Hackensack.—A bass, weighing twenty-eight pounds, was taken here in the Hackensack River the other day. It was a female fish with a very large roe, and is the largest caught within the memory of the oldest local silver-haired piscator.

Utica, April 20.—Large fish have already been taken in the West Canada Creek and its tributaries, within an hour's rail from this city.

PENNSYLVANIA—Greenville, April 27.—Striped bass are being caught in the Shenango here in large numbers; there should be a law protecting them this season of the year, as they are a gamey fish. **B.**

Sinemahoning Station.—Trout fishing is reported by J. M. Shaffer, proprietor of the Sportsman's Headquarters, to be the best known for years.

MARYLAND—Point of Rocks, April 29.—Ardent anglers all aghast; average ample hauls. Big hold bass bite beautifully; humpbacks bend, barely bearing burdens. Fine fish furnish famous fun. **W. X. Y. Z.**

VIRGINIA—Berkeley Springs, April 26.—Black bass fishing remarkably good this spring; large strings having been taken during the past few weeks. I notice that at this season they take the red worm as readily as the minnow. While fishing a few days since in the Potomac, I took a bass weighing 1½ lbs. that had a tape worm about 6 ft. long, which I pulled from its mouth, the same was very full of "roe." Is it common for fish to have this worm, as I have never noticed anything of the sort before? **Tip.**

We have published a great deal about grubs, parasites and worms in fishes; and only so recently as the 18th of April just passed. Tapeworms are occasional in fish, and not confined to any one variety. Within a short time we have known of their being found in bass, trout and salmon.—**Ed.**

KENTUCKY—Stanford, April 23.—Many strings of large bass have been taken from neighboring streams within the past two weeks, the largest that the oldest fishermen ever saw. Result of the partial observance of State Fish Law. Several that actually weighed four pounds have been caught. Such demand for reels and rods never before known, and the "Meek" stands head by a large majority. **KENTUCKIAN.**

TENNESSEE—Nashville, April 25.—Messrs. Parsons and Burgess returned last Friday from a fishing excursion to the mouth of Dog Creek, on Big Harpeth River. Fish are beginning to spawn up there also. This will put an end to good fishing for about one month. A number of fine trout have been taken in Drake's Creek, a stream thirteen miles from here, and a great many also at Lawrence's Basin. **J. D. H.**

WISCONSIN—Ashland, April 21st.—About 75 brook trout were caught in Whittlesey creek one day last week to one hook. **C.**

NO PLEASING EVERYBODY.—An anonymous letter, dated Cincinnati, April 28, says:

"Tell that correspondent of yours, who is instructing the uninitiated in black bass fishing, to take a tumble, or, in any event, to hold his next letter until after the bass season is over. Several of your readers and admirers unite in saying that such contributions are out of place in *FOREST AND STREAM*. Yours truly, **Bass.**"

[If we had thought the communication "out of place," we certainly should not have published it.—**Ed. F. and S.**]

SINGULAR ANGLING INCIDENTS.—**Boston, April 22.**—Having fished the lakes and streams of New England for thirty years, I have had some curious incidents occur, and thought the following might interest your readers: While fishing on a mountain stream, in swift water, I had a rapid bite, and thought I had hooked a large fish. On pulling out I had two trout on one line, one strung on the gut, the hook passing through his mouth and out his gill and hooked firmly into the side of the other. Fish No. 2 was ten inches long, and, pulling sideways against the stream, seemed a much larger fish. Second—While fishing in what we call dead water, on a stream in New Hampshire, I saw a large fish go up stream. I waited with fisherman's patience for an hour or two, then I crept up to the stream, and threw at a venture under an overhanging bough, and at the first throw I had the trout fast. I saw that he was a large one, and thought I would play him. I then saw he was pulling sideways. I shortened my tackle and landed my prize, and then found that I had not hooked him, but in my throw had cast the hook and line around him, making a slip-noose. On my way home, passing a locksmith's shop, I hid him on the old gent's square, and he stretched sixteen inches—not a large fish, but a large one for that place.

CALIFORNIA FISHING PROSPECTS.

EDITOR *FOREST AND STREAM*:

SAN FRANCISCO, April 5, 1878.

We have had an unusually wet and stormy season up to a late date this spring, but the glorious sunshine beams again upon the earth to make it bud and blossom and prepare for the largest and most abundant harvest probably ever yet known on our coast; and there will be, also, it is confidently expected, the largest influx of trout, owing to the abundant water in our streams, that has appeared here for many years. The trout season commenced on the first of April. There were not many fish to be fooled on that day, however, or many days following,

on account of the height and roily condition of the creeks and rivers. This has been, thus far, an exceptional year, however, and, in general, in this mild climate, trout fishing, especially for the dwellers in cities (to have an equal chance for sport with the rustic population who as yet pay but very little regard to the game law), April is not too early, although no doubt a few of the fish at that time will be found not to have emitted their spawn. As soon as the spring opens, and indeed long before that time, if not during the whole year, the dwellers in the rural districts in all parts of the country think they have a right, or at all events take upon themselves the privilege to catch trout in any manner they may think proper. Until a few of those unscrupulous and short-sighted gents are hauled up by persons appointed or voluntarily acting for that purpose, and made to pay a sufficiently large fine (paid to go to the informer) this very shameful, destructive and unlawful practice will go on here. I am afraid it will be a long time before the law will produce any very salutary effect in this matter, as our State is so extensive and the all-the-year-depleting system has been so long in vogue. But we must make a commencement in this regard, however difficult and discouraging the effort may be, and we must be careful that in process of time some substantial benefit for the preservation of all sorts of game animals on our slopes may be the result. At any rate, near our metropolises and some of our largest cities there is a well-founded hope that good may be effected by enforcing this law so as to preserve some game for our markets and some healthful sport and recreation for our citizens.

We have had no young salmon worth speaking of in our bay this winter, and consequently we have been deprived of the pleasant amusement which we have enjoyed in bait fishing for them for three years previously. **E. J. HOOPER.**

A HINT TO BASS FISHERS.

CINCINNATI, April 22, 1878.

EDITOR *FOREST AND STREAM*:

In your last issue "Norman" rather takes exception to my recommendation of a linen line for bass fishing, on the ground that it will bleach out white and scare the bass, which he considers to be a "silly" fish. You well answered that linen lines may be permanently dyed. Allow me to suggest another answer. A bass is never frightened by a line, and a white one is as good for him as any other. Let me ask "Norman" a question: Why does the bass seize the minnow on the hook in preference to the hundreds or thousands of others swimming freely about his feeding grounds? It is because it is almighty hard work for him to catch any of the free ones. They will swim all around him and not care a huck for him, but when he sees one in trouble, he rushes to a line unable to get away, with hardly life to swim, he goes for him. His reason-giving faculties are not sufficiently developed to enable him to perceive the man at the other end of the line.

Yours,

G. C.

DOINGS AMONG THE YACHT CLUBS.

EMPIRE YACHT CLUB.—Owing to the large influx of members from other clubs in the neighborhood, including many yacht-owners, the number of boats entered for the regular annual regatta has, even at this early date, reached the very satisfactory figure of 35, thus promising one of the best attended and most spirited events of the season among the junior clubs of the metropolis. The course is from the clubhouse, foot of 104th street, to the "monument" off Sands' Point and return.

NOVA SCOTIA YACHT SQUADRON.—The membership of this club has almost doubled during the past season, and two new yachts were entered on the list—the *Kestrel*, yawl, Vice-Com. White, and the *Hebe*, sloop, designed and built by her owner, Mr. J. E. Butler. There seems to be among the members a most praiseworthy zeal for the sport, and a desire to do everything possible for its promotion and popularity in the neighborhood, while its programme of events for the season indicates an amount of vitality among its members that many of the clubs in this vicinity might emulate to advantage. We notice with pleasure the regular dates set down for cruising in squadron under the flag officer's command, which form a prominent feature of the club's fixtures. The Hon. Secretary, Mr. F. C. Sumichrast, has compiled a handy little signal book, which is supplied gratuitously to yacht-owners, and which is of practical use to skippers on cruising days. It has been found that these events contribute very materially to the success of the club and the high place it occupies in the public estimate, while they also serve to add to its membership many who were first attracted to the sport through means of the squadron cruising. We commend this feature to our own clubs, and hope that some of them will see fit to incorporate regular dates in their fixtures on which the Commodore will hoist his flag and take charge of the fleet for an exercise drill. The Nova Scotia Squadron has appointed six special days for cruising, as before announced in these columns. There is one other feature, in which the club in question takes the lead of every one in the United States, with the exception of the New York Yacht Club. We refer to the manner of measuring for time allowance. Paragraph VIII. of their by-laws provides as follows: "The length shall be taken on deck between fore part of the stem and the after part of the stern-post, and on the keel on the line of the garboard strake. The mean of these two dimensions shall be taken as the just length for tonnage. The breadth shall be taken from the outside of the outside plank, at the broadest part, whether above or below the main-wales, and the depth amidships, from the upper side of the covering board to the under side of the garboard strake. These three dimensions shall be multiplied together, and the product, divided by 100, shall be deemed the true tonnage. Any decimal of half or more than half a ton shall count as a ton, and any less shall be disregarded." This rule we have quoted verbatim, and, it must be confessed, is a vast improvement on the crude length measurements adopted by most clubs south of the St. Lawrence. It is quite possible though that it will admit of some simplifications in practice, but in theory the Nova Scotians have struck the true course, avoiding the alluring snare the simplicity of length measurement holds

forth, and at the same time steering clear of the one-sided and fallacious show of arguments offered in extenuation of the ridiculous Timmes rule. Boldly taking the hull by the horns, our friends in Halifax can congratulate themselves upon the adoption of a rule fair and equitable to all forms alike, and one that will admit of matches of instructive results between the deep keels of English model and the native American sloops that meet at the starting line for a friendly brush in Halifax waters. The Nova Scotia Yacht Squadron has made application to the British Admiralty for a warrant to fly the "Blue Ensign." Until this is received the plain "Red Ensign" will be carried. Cannot some of the flyers of the club be induced to meet their Southern brethren at Portland, the Isle of Shoals or Boston?

HALIFAX YACHT CLUB.—Overtures have been made this organization to consolidate with the Nova Scotia Yacht Squadron, the most vigorous of the Canadian clubs. It was found impossible, however, to effect any mutually agreeable arrangements for a union. This we regret since there can hardly be material enough for two prosperous clubs in Halifax Harbor; and if both would bear in mind the French proverb, "*L'union fait la force*," there ought to be no obstacle in the way of promoting the interests of yachting in Halifax by united effort. A little yielding of its autonomy on the part of the larger club would conduce materially to the individual advantage of every yachtsman in Nova Scotian waters.

SAN FRANCISCO YACHT CLUB.—Successful property being held at fancy prices, it seems likely that the committee having the matter in charge will determine to build a floating house in preference. By all means do so, say we. The experience of our Eastern clubs will serve to those on the Pacific as a guide to select by. Permanent fixtures have seldom been found satisfactory, even with our older and wealthier clubs. The N. Y. Y. C. have abandoned the house erected by the late Mr. Garner, and the Brooklyn Y. C. have concluded to dispose of theirs at Graves End Bay. The Columbian and others have experienced trouble and expense in shifting from one locality to another, but those with floating houses on scows all declare themselves well satisfied with their accommodations. No trouble keeping the scows tight, and the expenses very moderate.

DUNBURY YACHT CLUB.—The famous old New England town, Dunbury, which once used to lead in the ship-building industry, still has some of the old money for the men left among its good people. Two years ago a club was formed which now numbers 114 members, with thirty-nine yachts, certainly not a bad showing for so young an organization. The officers elected for the year are: Commodore, T. A. Hutchins; Vice-Commodore, G. A. Green; Fleet Captain, N. B. Watson; Recording Secretary, A. A. Green; Financial Secretary, G. A. Green; Treasurer, A. G. Collicott; Measurer, E. W. Watson; Regatta Committee, T. A. Hutchins, W. A. Drew, C. H. Thomas and L. H. Keith.

PROVIDENCE YACHT CLUB.—At the annual meeting of this club the regular regatta was set down for May 31; there will also probably be a fall race at Bullock's Point. The following officers were elected: Com., E. J. Anderson; Vice-Com., H. L. Clark; Sec. and Treas., E. F. Dustin; Regatta Committee, C. L. Manchester, H. L. Clark, Simon Cameron, W. I. Pierce and James Rogers.

COMMERCIAL YACHT CLUB.—This is the name of a new organization recently started in San Francisco. The yachting fleet consists so far only of the *Minnie*, and is consequently not very numerous. But as "out of little acorns great big oak trees grow," who knows but that ere long the new club will make more noise in the world than at present.

EMPIRE YACHT CLUB.—The date of this club's regatta has been changed from June 19 to the 18th. Twenty-one boats have entered and more in prospect. There will also be a gathering of catamarans, which will sail in the special class for ghosts.

NEW JERSEY YACHT CLUB.—The members of this club have concluded to hold their annual regatta June 18, and will sail over a course from 12th st., Hoboken, around a stakeboat moored off 85th st., N. Y., three times, making a total distance of about 18 miles.

KNEEKERBOCKEN YACHT CLUB.—The *Emma D.*, of the Empire Y. C., has been entered for the Kneekerbocker regatta May 15. As the *Emma* is a fast boat and has a crack racing crew to work her, she will give a good account of herself.

LONG ISLAND YACHT CLUB.—The annual regatta of this club will take place June 11, off the Short Beach House.

YACHTING NEWS.

STEAM-YACHT BOYD.—The steam-yacht *Wm. Boyd*, Empire Y. C., Mr. Chase owner, is receiving a new boiler and engine, which, in connection with a large wheel, ought to make her a speedy lurcher. She has a very fine model made by Smedley, and is 55 ft. 8 in. long, and 11 ft. beam. We must say that her lines are more nearly what is required for high speed than anything of her class we have seen in wood. She has small beam, is very sharp at both ends, small girth and sends an almost solid body of water aft to the screw aperture. The engine is from the shops of the Fitchburgh Machine Co., and that is saying enough as to its first-class quality. It embodies largely the ideas of Mr. Chase himself; among them being a crank placed out of a solid forging, a single eccentric arranged to reverse by the rod traveling on a rocker guide or solid flux around the eccentric itself, making the reversing gear of the simplest character; brass houchings to all bearings; case-hardened nuts and an arrangement which throws automatically the bar used to pry the engine off the centre. The cylinder is 8x7 in., and the whole structure strong and compact. It will work up to about 11 ft. P. For power the yacht will receive a vertical tubular boiler 5 ft. high, 30 in. diam., with 14 tubes 1½ in. diam. The usual centre tubes will be omitted, since Mr. Chase's experience has led him to prefer dividing the fire and sending the heat up tubes near the outside of the shell in preference to allowing a large portion of the heat to pass off up the chimney through the direct passage offered by the centre tubes. The new plan will certainly save fuel, while the loss in heating surface will not be great, considering the increase gained in that most valuable portion, the tube sheet itself directly over the fire. The *Boyd's* propeller is likewise the result of some extensive experiments carried out upon her by her owner. The well-known DeLamater and Philadelphia wheels and others had all been lately tried but did not produce results as favorable as the following contrivance of Mr. Chase. As he acknowledges, it may be a most unscientific concern, but there are the actual results, so what can be done about it? This propeller is no screw at all, and has no pitch, but consists simply of flat plates secured at an angle to the shaft to arms, in a manner similar to the fans of a patent windmill. This arrangement

does away with all the hub and useless central portion of the ordinary propeller which serves only to churn up the water and leads to a heavy sacrifice in power. As might be expected, Mr. Chase finds that he can get greater speed out of his boat with his fan propeller, or what is the same thing, the same speed at a saving of fuel. In the *Boyd* the propeller arms are of composition and the blades of shovel steel riveted to the arms, the diameter being 36in. In a smaller boat experimented upon, 31ft. 6in. long, the propeller was 28in. diam., and the shaft of only 1 3/16 in. steel, while her engine, a 4x4 1/2, worked up to 300 turns with a three-bladed fan, but with a two-bladed one fifty additional turns were required, showing that in this type of wheel there must be a material increase to the area of two blades to produce the same results as with three, a fact contrary to that observed with the ordinary screw propeller. Four blades to the fan were found less satisfactory than three. The *Boyd* will be supplied with Freedman's injector for feeding the boiler aside from her regular pump connected with the engine framing.

NEW CUTTER YACHT.—Lawlor, of Chelsea, Mass., is making rapid progress on the new cutter building for Mr. J. E. Peabody, former owner of the *Violet*. The cutter is 53ft. over all, 43ft. on load line, and 15 1/2 ft. beam. From these dimensions it will be seen that though cutter-rigged the new craft will not differ much in model from the general run of American yachts, excepting that her sea-going abilities will be materially improved by a keel with lots of ballast on it, and more between the timbers. She is to have 6,800 lbs. iron on her keel, and 3,000 inside. She will be regularly cutter-rigged, and her owner no doubt will find his new rig a very handy arrangement if he expects to cruise out in the open, but if he proposes to confine his operations to the harbor and neighborhood, he has expended a good deal of money for nothing, and will find it necessary to keep on his rolls a larger crew than with the ordinary sloop rig.

DELAWARE BOAT SAILING.—The boats of the Southwark Yacht Club, of Philadelphia, will sail from Dickerson St. wharf to Chelsea Buoy and return, May 27. Boats are divided into three classes—the first 15ft. 3in. long, and 4ft. 6in. beam; the second are 4in. narrower; the third comprises boats with square sterns or "tuck-ups," as they are called in the local phrase. Length of course, thirty-five miles. Officers of the club: Commodore, John C. Saunders; Vice Commodore, Joseph P. Kennedy; Rear Commodore, C. W. Atkinson; Secretary, Jas. W. Winterbottom; Treasurer, Isaac Sharp; Measurer, Geo. W. Brugam. A large number of boats have been entered for the race, and a new one is building for Mr. Saunders.

OCEAN CRUISING.—The sloop *Maggie B.*, before noticed, has arrived safely at Charleston, S. C., whence she will put to sea again for Jacksonville, Fla.

YACHTING DRIFT.

Mr. D. C. B. Gibson, of the Jersey City Yacht Club, has had a steam launch 38ft. long, built by Joralemon; speed about 12 miles.....Jersey City Yacht Club will cruise up the Hudson in May.....Mr. Andrew Boulker is having a new boat built 19ft. long, 8ft. 6in. beam and 2ft. 6in. deep.....Joralemon has just finished a sloop for Mr. J. N. Westervelt, also one for a Squan Inlet gentleman.....Pat McGiehan's new 24ft. racing jib-and-mainsail will sail everything she meets this summer. Her colors will be seen in the van during the coming Bay regatta, if she is at all like the model he generally fancies.....Pavonia Yacht Club has its headquarters foot of Pavonia Avenue, Jersey City.....Stephen Callahan has built the *Nathan B. Foster*, a racer 27ft. 5in. long, 11ft. 8in. beam and 3ft. deep, for Mr. Wm. Taylor.....New Jersey Yacht Club has its club house in the old N. Y. Yacht Club quarters at Elysian Fields, Hoboken. Its annual regatta takes place June 14.....Sloops *Louisa*, *Mist* and *Mystery* have been bought by members of the New Bedford Yacht Club.....Mr. F. C. Smith, of that club, is building a new catboat. The club has received an invitation to attend the regatta of the Brooklyn Y. C. in June. Now there is a chance for the famous old *Sileia*. Her owner, Mr. Thos. Nyc, Jr., we know to be an enthusiastic skipper, descending from a long line of sea-faring ancestors, and if he will but trip his book and give some of our New York cracks a rub we think famous *Sileia* will again show the stuff she is made of.....*Active* will have a new bowsprit 3ft. 6in. longer than the old one. This will give her 74 sq. ft. more in her jib, and make her look better besides. This increase is to make up for the shoe he taken off aft.....The old *Amaryllis*, Mr. Hughes owner, held her own in a crush last week with *John Gilpin*, though the latter is the longer of the two.....Sloop *Undine*, formerly of the Brooklyn Y. C., but sold to Philadelphia parties, has been resold to a Boston gentleman.....Sawyer is making a new suit of sails for the *Triton* schooner.....*Idler* is to go into commission after all.....Sloop *Rambler*, of Riverdale, will live up things about Yonkers.....The cabin sloops *Conway* and *Chester A. Arthur* will meet at the Empire regatta, and a lively brush between these two fast ones is expected.....At the same regatta a steam launch race is contemplated. If so, limit the steam to be carried, both for safety's sake as well as for simplifying deductions from the result.....J. W. Clark, of Nottingham, N. H., has built a catamaran for W. H. Small, after a New York model. It will astonish the natives.....Sloop *Myra* is fitting out at Frank Bates' yard.....Steam yacht *Chronometer* was launched by W. T. Malster at Falls Point, Baltimore. She was built for W. O. Dimpfel, and is 43ft. long, 6ft. 11in. beam and 5ft. 5in. deep. Compound engine, 12in. stroke. Propeller, 46in. diam., three blades, expanding pitch.....The veteran Capt. Andrew J. Comstock will sail Mr. Wallack's *Columbia* as heretofore.....*Christine* is coming out as a racer this year. Mumm has her in charge and is giving her a mighty big stick.....*Dolphin*, Mr. Cooper, is one of the old style boys, but she is a comfortable cruiser with lots of room below. She will be put in commission in a few days.....*Siren* has been overhauled at the foot of Court st., Brooklyn, and will hoist her huzzee at the truck of a new set of spars. If her owner could only manage to get rid of the incongruous paneling on her trunk she would look materially improved.....*Nomad* looks smart this season. She has been put in commission and seems to be lower in the water than formerly.....*Orion* flies the champion pennant at her moorings.....*Amaryllis*, progenitor of the double hullers, has received a cockpit in the shape of a pancake on her back. What with the fresh coat of red this fiery untamed steed is prepared to tackle any of your old slow coaches who still believe in the antiquated notions with a bottom to stand on and a roof over head.....The new sloop *Comet* has taken aboard a pile of pig, about 3 1/2 tons, we understand, and an inch more draft would not seem much out of the way either.....The owners of the property about Gowanus Basin have not kept to their word so far. The wreck obstructing the fairway has only been partially removed. They are driving the yachting trade away from the neighborhood. Already we

hear of parties about removing their establishments to Bay Ridge.....*Active* has been hauled out on the ways at Mumm's. There is some talk of her owner wanting to alter her pretty cutter stern into the characteristic oval or elliptic style. It is to be hoped he will not.....Sunday last the crew of a prominent yacht at Gowanus pulled ashore stern first, fenders out and painter trailing overboard. Such hummerism should not be permitted.

THE OAR AND PADDLE.

THE UNIVERSITY RACE.—Owing largely to the exertions of many prominent citizens and officials of New London, the race between Harvard and Yale has been secured to that locality, and we feel bound to give our entire approval to the selection, both from the standpoint of the competitors as well as from that of the public in general. It is a matter of satisfaction to all those who at a former college race were so outrageously swindled by Saratoga's worthy citizens—most notable among whom should be mentioned that kind, considerate philanthropist, Moon, who keeps a shop near the lake, where for the small sum of twenty-five cents the thirsty soul can relieve his feelings with a thimbleful of soda water—to know that the chances of such shameless extortion can hardly be practiced at New London under any conditions, even were the people there disposed to do so. Moreover, the advantages of the New London course are apparent at once. The only plea upon which the Saratoga neighborhood was selected—that of smooth water—proved to be an hallucination, for more than once do we remember a race postponed on account of inclement water, and so the possibilities of there being a little lop on the Thames, are no worse than what we find on every other open course in the East. A perfectly straight course to the southward, four miles long, can be obtained from Perkins' Point to a station off Winthrop's Point, opposite the city. But this course brings the crews rather nearer to the shore, in passing Navy Yard Point, than they desire to go; a slight bend is therefore recommended, and will probably be adopted by the regatta committee. The facilities of New London for the accommodation of a large influx of transient visitors, as well as for spectators, are ample and unsurpassed. The gradual rise of the banks afford excellent opportunities for viewing the scene, and the railroads along shore are to introduce the novel feature of a traveling grand stand, composed of cars supplied with terraced seats, and carrying 2,000 or 3,000 persons, which will follow the boats down to the finish. The hills on the banks, and Fisher's Island to the southward, protect the river from anything like seriously rough water. The representatives of the Yale navy went over the course April 20 and selected quarters for their crew at Gates' Ferry, half a mile above the starting point. They will board with Mr. Williams of that village, and their boat house will be but a few rods distant. The Harvards have decided to quarter at the Stoddard House, a mile further to the south.

YALE UNIVERSITY CREW.—The following gentlemen form the university crew for the year: Bow, J. Curtiss of '79, or J. P. Clark of '78; No. 2, F. Hyde, '70; No. 3, H. Livingstone, '79; No. 4, Wight, '80; No. 5, H. Taft, '81; No. 6, Rogers, '81; No. 7, David Trumbull, and stroke, O. D. Thompson of '79. The average age is 20 years 5 months.

WORLD'S CHAMPIONSHIP.—Courtney, in reply to many derogatory articles published in consequence of his recent demand to select his own water on which to pull against Trickett, is out in a letter announcing his willingness to row any man in this country for anything reasonable on any reasonable water, and give or take reasonable expenses, all of which is certainly reasonable enough. He further states that had not the spurious challenge from Trickett appeared in the press this winter, intimating his willingness to come to America, he would ere this have been on his way to Australia to heard the lion in his den. However, as things stand, he proposes to pack his trunk for the Antipodes the coming winter, and give Trickett all the warm work he can want, over his own course at home, for the championship of the world. Courtney is also anxious to meet Johnny Bull's much vaunted men of the oar, and offers as an inducement \$5,000 a side and \$1,000 for expenses. Come now, Johnny, you can't shirk this time behind any amateur quibble. Send your man over or else keep quiet. In short, Courtney is willing and anxious to meet anybody on fair terms to establish his claim to the championship at home and abroad, and unless it be Trickett we don't know of any other man who could show Courtney the way across the finish. On the other hand, Trickett, who now dispenses hospitality as a sleek-faced Boniface at Sidney, will measure oars on the Paramatta River with any one who has a mind to try him on, and he very rightfully asserts that since his heating Sadler, the latter having left his American competitors astern, it follows that Courtney or any other American must come to Trickett and not the other way. So Courtney, true to his last letter we hope, will soon be on the raging main, bound for Trickett's worthy scalp. This clears up the whole imbroglio. The Australian remains champion until some one goes out there and beats him.

HARVARD AND CORNELL FRESHMEN.—The Harvard freshmen crew claims to be willing to row Cornell freshmen when and where they want, and the Cambridge boys think it is a lack of spunk that troubles the Ithaca blades. The latter want to pull on Saratoga, but mosquitoes, professionals and Moon's outrageous charges don't suit the others, who propose the course on the Thames. What with the great university race to be pulled on its waters, the inhabitants of New London and its authorities have it within their power to make the Thames the centre of New England's boating interests, and it must be confessed that they have shown a laudable desire so far to do all in their power to protect visiting oarsmen and the public from the extortion and outrage so commonly practiced at all centres of aquatic events. Of the Harvard freshmen, four weigh over 180lbs. each and the average of the rest is over 165lbs. Glorious stuff to manufacture some of the future 'varsity sixes out of.

HENLEY REGATTA.—The Columbia crew seems to be the only one likely to start at the Henley Regatta—at least, we have not yet heard of the six weeks' notice required by the stewards having been repealed, and so the number of American crews present will be narrowed down to a single one. It is to be hoped that, in the event of its defeat, our English cousins will be able to draw considerable satisfaction from their barren victory, though we fail to see how they can reconceive such feelings with their evident desire to put in Coventry every other American crew likely to give them their splash. The funds for the Columbia have been subscribed, and the crew leave in the City of Chester, May 23. They will put up at the Red Lion, an old landmark on the Thames, about three miles below the course. With so many crews to

pull against, the odds are certainly against them. But let us hope for the best, and may the "blue and white" show up in the van at the finish.

LOUISIANA AMATEUR ROWING ASSOCIATION.—Twelve clubs belong to this union, which shows that boating in the Pelican State is not behindhand. Their annual regatta will be held at New Lake End, July 15, near New Orleans, and it is proposed to interest the oarsmen from Charleston, Galveston and other places in the event. The following clubs will be represented in every race: Perseverance, Magnolia and Hope. The Louisiana, St. John, Howard, Orleans and Southern have not yet decided definitely, but will, no doubt, send crews to the line in some of the races. The Riverside and the remaining three may not take any active part.

POTOMAC BOATING.—The Annapolites and Potomacs are actively at work. The former have received a challenge from their old friends and rivals, the Undines, of Baltimore, which has been accepted. It will come off over the Spring Garden course at Baltimore. The Potomacs are to receive a new paper four from Waters & Sons, of Troy. Mr. Richard Morgan, of the same club, has received a new single, and is in daily practice.

PASSAIC RIVER ASSOCIATION.—The amateurs forming this association will hold a June Regatta, as usual, June 22. The National Regatta will take place at Newark in August.

CANOEING.—The *Rob Roy* canoe, of the MacGregor pattern, is 14ft. long, 8 1/2 in. deep and 26in. beam, and will carry from 125 to 175lbs. The *Nautilus* canoe, of the Baden Powell pattern, is 14ft. long, 23in. deep at bow, 19in. at stern, 0 1/2 in. deep amidships, 26in. beam, and has a sheer of 13 1/2 in. It will carry 300lbs., and is rigged with mainsail, jib and dandy. It is essentially a cruising or sea-going canoe, and can be sailed in almost any water.

THE HERALD CANOE.—To many tourists and sportsmen the *Herald* canoe is well known, and to those it is needless to expatiate upon this the model canoe. The *Herald* canoe is built somewhat after the Indian birch canoe, and possesses all the advantages of the birch, with many improvements. For strength, with the same weight, it has no equal, and is so shaped as to sit on the surface of the water, the advantage of which is apparent when we consider the many shoal places and rocks which one finds on a cruise or hunt. Another grand feature is the great speed attainable with but little power, and moves over the water noiselessly. This can be paddled by one or more persons, which is not the case with others with fixed decks or covers. The *Herald* is built with thwart or without, to admit of sleeping arrangements. In order to be a canoeist you are not obliged to sleep in your canoe, however. You may take your canoe ashore and sleep beneath it, or take a tent with you for a shelter, and still be as much of a canoeist as the man who sleeps nowhere but in his canoe. The construction of the *Herald* renders it positively free from leakage, and will stand more service than any similar craft, and its model cannot be surpassed for beauty. The following remarks are offered in opposition to an article in *Harper's Monthly* for April: "As the *Herald* canoe is built for the use of sportsmen as well as for cruisers, it is purposely left open, but is decked over permanently, if desired, or is supplied with a covering which buttons on (which is much better), thus preventing the rain or spray from wetting the inside. The deck or covering is only put on when ordered, as the majority of canoeists do not care for them. The advantage of this covering is that it can be taken off and put on at pleasure. The covering needs no painting when made of close woven and middling thick duck. About 8 oz. duck is sufficient."

The objection made to an open *Herald* canoe on account of carrying the necessary trappings and provision in a bag is entirely imaginary, and in this instance theory and practice will not pull well together. All practical canoeists concede that there is nothing equal to a bag for the storage of provisions and equipments.

In making a canoe, which happens many times in a day during a voyage, everything can be taken out bodily when stored in bags and taken across the carry, and the *Herald* captain will have taken his canoe and load across really for a new start, while the man who puts his stores in the air-tight apartments of his craft is making preparations to do the same. Also when stopping to camp, the *Herald* man has all his trappings, etc., brought out together, and the cruiser who has no bags must trot to and from camp many times before he finally clears his canoe, or else he must pick up his canoe and load together, not a very easy task to perform, especially if he has provisions for any length of time.

If our friend who objects to the trouble of opening and closing a bag should at any time take a canoe trip, we think he would say on his return that there was nothing like a bag of some sort for the storage of articles, no matter what kind of a craft he might travel in.

The thwarts are not necessary to hold the sides in position as stated by the opponent, but are put on for the convenience of the paddler, and can be dispensed with if desired. As to the amount of sail to be carried, that is left entirely with the purchaser, but one sail stepped in the proper place is considered better than two, as all the sail that is necessary can be had in one, and of course can be handled to better advantage. Another statement made in regard to carrying a cargo is decidedly inconsistent. He advises the canoeist not to buy a *Herald*, but to use every argument possible to induce his friend to purchase one, so that when accompanying him, the friend can be induced to take most of the cargo, the stowage capacity of the *Herald* being so much better than in the other type of canoe, and then goes on to say that in case of a capsize the *Herald* spills everything overboard, and in a smart shower wets her cargo thoroughly. He says if by any means the *Herald* canoe fills she will quietly sink and leave the occupant to swim for his life. This is a mistake. The *Herald* canoe will not sink when filled, and there will be buoyancy enough to the craft to keep two persons from drowning.

The writer states that the *Herald* canoe does not paddle well, as each stroke of the paddle deflects her head from her proper course. This wabbling tendency, he says, is owing to her lack of keel. We wish to say that the real canoeist requires no keel or rudder to keep his craft straight; with a stroke taken fair, fore and aft, with and near to the side of canoe, with the upper hand nearly upright over the lower one, followed by a very slight turn of the paddle coming out of the water will keep the canoe straight on its course. Inexpertness only causes wabbling.

The next statement made in *Harper's* is hardly worth making note of. He says the *Herald* canoe is not beautiful, and her model is not graceful, etc. We are perfectly willing to leave this to the judgement of one and all who may have examined the *Herald*. Examine for yourselves, and ask advice of those who have experience both in cruising and hunt-

ROWING RIPPLES.

Answers to Correspondents.

H. M. P., Baltimore.—Twelve cats.

C. E. I., East Templeton, Mass.—What is the velocity per second rifle bullets? Ans. Not an easy question to answer, as much depends on length of barrel, charge of powder, and weight of projectile.

J. S. W., Rochester, N. Y.—1. How can I preserve birds' wing feathers? 2. How can I preserve large ones, such as crows', etc.? so that moths and other insects will not attack them? 3. What is the relative penetrability of shot? 4. Are the U. M. C. Co.'s shells more likely to shatter than Eley's? 5. What kind of wadding is best for use in shotguns? 6. How can I keep powder from getting damp? 7. How can I keep powder from getting soiled? 8. How can I keep powder from getting soiled? 9. How can I keep powder from getting soiled? 10. How can I keep powder from getting soiled?

done. If the waters are private property, I control their use for any purpose. But from the fact that the State has stocked the lake we should think the waters were public, as it provides for the stocking of public waters only. The size of the lake was large enough to be navigable; would not make much difference unless it was large enough to be navigable, would not make much difference unless it was large enough to be navigable.

In any case, whether the waters are public or private, the owners can prevent fishing from their land. But if the water is public, your correspondent can get him a boat and fish from there. He could also add that the fact that the State had once stocked the lake made it public. Something more would be needed to make the waters public property.

At the lower range, the Wylie Badge was shot for. Conditions, 5 shots at each distance, 300 and 500 yards, military rifle without cleaning. Captain Livermore, U. S. A., one of the first officers in service who seems to take an interest in rifle matters, was for a second time the winner.

Capt. W. R. Livermore.....	39	J. Harris.....	28

Total.....	1,619
Average, 193 points.	Average, 179 points.

NEW YORK—Saratoga Springs, April 19.—In the competition practice on the 18th of April for position on a team to shoot the Milwaukee Rifle Club, Mr. William H. Benson made, at 200 yards off-hand, with a Stevens rifle, three pound pull, 5 4 5 5 5 5 5 5—49 out of a possible 50, without any sighting shots. J. M. A., Jr.

[This is indeed a remarkable score.—Ed.]

TELEGRAPHIC MATCH.—Saratoga v. Milwaukee.—This match which has been off and on for some time was finally shot on the 29th. The following is the Saratoga score: At the 500 yard range, out of a possible 75—Joseph W. Shurter, 74; George W. Ainsworth, 74; John Webb, 72; Jerome Pitney, 73; total, 292. At the 200-yard range, out of a possible 50—O. J. Wing, 44; Daniel Eddy, 45; total 176. Grand total, 468. The wind was blowing across the ranges and shifting.

MILWAUKEE, Wis., April 29.—In the rifle match to-day between teams of the Saratoga (N. Y.) and Milwaukee rifle clubs, the Milwaukee team scored 283 points out of a possible 300 at the 500-yard range, and 159 out of a possible 200 at the 200-yards; total 442. The weather was cool and cloudy.

—A prominent member of the Milwaukee team writes to us privately, saying: "The shooting of the Saratoga club at 200 yards, off hand, 3 lbs trigger pull, is remarkably fine. If they can do such shooting every day, they can call themselves 'boss.'"

THE SARATOGA RIFLE CLUB.—Want of space prevents our doing full justice to the very high scores made by the Saratoga Club in their match with the Milwaukee riflemen. In our next issue we trust to give the names in full.

JERSEY RIFLE ASSOCIATION.—It seems very likely that the range will be at Elizabeth, on the line of the C. R. of New Jersey. The ground will be some 120 acres, and the distance covered some 1,200 yards. The cost of arranging the grounds will be \$5,000. Fourteen canvas targets are to be put up. Governor McClellan seems to take a very great interest in rifle practice in New Jersey, and has been of signal service to the various committees.

THE RIFLE AT RAHWAY.—Match at Rahway, April 27, for all-comers' badge:

F H Holton.....	4	4	4	5	5	5	2	4	44

REMINGTON RIFLE ASSOCIATION OF CARLISLE, PA.—This new organization, of which Capt. W. E. Miller is Pres., H. H. Newsham, Vice-Pres., and A. D. Boas, Secretary, have already commenced their work. The target is at the Carlisle Springs Road, giving practice of 1,000 yards. Practice will take place every Thursday and Saturday.

SALT LAKE CITY RIFLEMEN.—The Deseret Rifle Club of Salt Lake City, have decided upon a much larger range of work during the season of 1878. The firing points at 500 yards have been opened, and 2d class targets erected. At the spring meeting of the Utah Rifle Association, Mr. Jake Heusser, of the Deserets, led the 500 yards work with 49 in the possible 50, and at 200 yards three of the first prizes went to members of the Deseret club. A match by members of the club is held on the 24th of each month for a medal, which is to be won 5 times before becoming personal property. Mr. E. McLaughlin and Mr. John Sharp have each taken it four times. Mr. Jas. Sharp and Mr. Bolivar Roberts have taken it three times, and Mr. James Groesbeck and Mr. Jake Heusser once each. At present it is held by Mr. M. M. Young. The Deseret Club numbers 35 members and the officers are: Bolivar Roberts, Pres.; W. K. Conrad, Sec'y and Treas.; John Sharp, Jr., Vice-Pres.; E. McLaughlin, John Groesbeck and Jas. Sharp, Executive Committee.

SONORA RIFLE CLUB.—A rifle club has been organized at Sonora, Cal., with Joseph Phelps, Pres., S. S. Bradford, Vice-Pres.; H. H. Rowell, Treas.; and J. Shaw, Sec.

AUXILIARY RIFLE BARREL.—The manufacturers of the auxiliary rifle barrel of New Haven, beg us to inform the public, in reply to numerous inquiries made them, that they advise for use the Winchester Repeating Arms Co.'s cartridge, No. 32 and 38, extra long, and the No. 41, model 1873. These cartridges give the most precise results.

AT LONG BOWLES.—Some recent Austrian experiments, with soldiers picked indifferently from various regiments, armed with rifles, show what injury can be inflicted at exceedingly long ranges. Military men are looking at the effects of a better class of arms, introduced by Americans into Europe, as were especially used by the Turks. In Austria wooden targets were set up representing three guns in action, with men serving the pieces. At fifteen hundred yards distance a company of infantry, 236 men strong, opened fire. In three and a half minutes each man had fired ten times, and nine per cent.—over 262 balls—struck the target; sufficient to have put all the guns hors de combat.

THE RIFLE IN THE DOMINION.

HAMILTON, Ontario, April 23, 1878.

There has been nothing done in rifle shooting on this side all winter, and consequently but little of any importance in that way to write about. There have been several pigeon shooting matches around this locality, but they do not interest me, and think glass ball shooting far superior in every way. We had two small matches with the Snider rifle here on Good Friday, which were the first of the season, and attracted a good many visitors to our Victoria Rifle Ranges. Being the first practice of the year, the shooting was not up to the mark, but it was as good as the weather, which is not saying much for either. The following were the prize winners:

Match No. 1.—Ranges, 200, 500 and 600 yards; five shots at each range.

Score.	Prize Value.	Score.	Prize Value.
Sergt D Mitchell.....	\$6 51	Priv Dow.....	45
Private Morley.....	40	Priv Morris.....	45
Lieut Adam.....	30	Lieut Ryan.....	42
So St Paul.....	20	Priv Omand.....	42

Lieut.-Col. Bacon, of Quebec, has invented a new canvas target, the plan of which he has kindly sent me a copy of. It is, without doubt, the best target which I have seen, and have shot at those in use England, Ireland, Scotland and Canada. Indeed, with Lieut.-Col. Bacon's canvas target it is doubtful if there is anything left to improve upon. First, it does away with the necessity of the butt being inclosed or covered, which is very trying on the marker on a hot day. In this one the marker has all the ventilation which the marksmen have. Second, it can be converted to a first, second or third class target in about twenty minutes; third, it can be operated by a boy of fourteen or fifteen years of age, being balanced so that there is no labor worth speaking of. The frame is made of iron, and all the part exposed to the bullets is V shaped, so that there is no danger of the bullets splashing and hurting the marker. They go through the canvas, making a small hole, which cannot be mistaken by the marker, and consequently obviates any mistakes, which are often made on iron targets. It works as follows: The marker is sitting on his

seat looking at the target, which is in front of him, with a rod or lever close to his hand. The bullet goes through the canvas and leaves a hole about half an inch in diameter. He then puts a disk on to the bottom part, showing the value of the shot, and pushes the lever, which brings the target down like an awning over him, and at the same time the disk goes up in full view of the marksmen, he hangs a small disk in the hole the bullet makes. He then pulls the lever, and up goes the target, so the marksmen not only sees the value of his shot by the first disk, but when the target goes up sees by a small one the exact spot his shot has struck. The next man shoots; down comes the target, again the marker putting on a disk as before. He takes out the little disk on the first shot, and pastes a small patch on the hole, and pins the disk into the last hole made, and so on. They were tested last year at the Montreal matches, and, although not completed, gave the competitors the utmost satisfaction. Have no hesitation in saying that they will be generally adopted before long, being so cheap, the iron work of one convertible into first, second or third class class, only costing \$50. I have received from a committee appointed by the N. R. A., of New York, a letter containing a proposal of holding at the annual meeting at Creedmoor, an International Military Match, open to all countries and colonies. I think the idea is a good one, and would be a very interesting match. And my suggestions as to the best arrangements for carrying it out is asked for, I take the liberty of giving you my views in a brief word as to what I consider would be the best manner to make it a success.

First, I would have it shot at the most difficult ranges (or rather two of the most difficult), say 300, 500 and 600 yards, ten shots at each range, and, for the benefit of foreign teams, sighting shots at each range. Second, I would suggest that the rifles to be used should be the *bona fide* ones, used by any regularly constituted battalion of Regulars, Militia or Volunteer force, and that the team should consist of twelve men chosen from any or all of the three above-mentioned grades. Fourth, I think that the prize ought to be a trophy to be yearly competed for on the range chosen by the victors, after the first year. It would also be, perhaps, advisable to give each of the individuals of the winning team a small badge as a memento of their victory. And last, though not least, I would suggest that the half of the proceeds of the entry money at the gate should be distributed in a proportionate way to the four teams making the highest aggregate scores. It would help to pay the expenses of those teams to and from the match. These are a few of the principal points which strike me, without going into it in full detail. But I don't think the arrangements could be placed in better hands than the three gentlemen appointed as a committee to carry it out, viz.: Messrs. Wingate, Wylie and Waters. SNOOK.

NICK ON THE AMERICAN TEAM OF 1877.

There is a tempest in a teapot rising over the action of the American team of 1877, resolving to start out on an independent idea of their own in the selection of the team to shoot the next international match on behalf of the United States. However ill-timed and devoid of common gratitude such action on the part of the team may be, it finds a grain of reason in the loose manner in which the rules for the international match had been drawn up. Some weeks ago I pointed out the general fault in the literature of the N. R. A., but the team men cannot be so utterly devoid of all idea of logic as to suppose for a moment that because the conditions of the trophy do not specifically name the National Rifle Association of America as the managers of subsequent matches on the roll, that therefore such an irresponsible body, comparatively speaking, as an ex-team, should assume the right. What the team may and must do is positively laid down. They are to fix time and place for the next match, and there the work of the team as a body is done. They are collectively held responsible for the safe return of the trophy in time for the next match. Whatever faults the conditions may show, and many of them have never yet been bronched, there is none so far as touches the duties and powers of retiring teams. They are given all the power which it is safe and proper they should possess, and all they would ask or attempt to exercise if their motives were alike guided by decency and discretion.

Go back a couple of years and recall the angry, even acrimonious discussion which followed the resolution of the Board of Directors N. R. A., to allow the members of the old team to stand on their previous record as against the efforts of new candidates for team honors. However improper this was, and none heretofore it more vigorously than old "Nick," it would have been tenfold more galling if such a notion had come from the team itself. If I remember aright some of the present team members were then most vigorous in fighting this concession to the "has been's," and now they bring up the very same motion in even a more ineluctable and objectionable form. But the team will say that they represent the riflemen of the country, and in their capacity of the champions have the most undeniable claim to speak for the whole community of riflemen. There may be some truth in this, but are not the officers of the N. R. A. equally representative as the chosen ones of the leading association of America? The one body has won its way by works, and has not presumably any deliberative wisdom or managerial ability; the other body is chosen specially on account of its supposed merit in these respects. The taking of any steps by the team outside of the limits laid down for them at once raises the suspicion that the move is one for self-perpetuation, that the team having tasted how sweet the soil is the action of being the champion shots of the world, are not willing to step down and out.

The old team members can do much to help the N. R. A. in their selection of the next team. They have had a valuable experience, and by suggestion and co-operative labor can do much to make the perplexing task of selecting a representative team an easy one for the committee of the National Rifle Association. But it is entirely unmanly for piece of foolishness on their part to approach the work of supererogation they have undertaken by attempting to show that the National Rifle Association of America is not true to its name. Whatever the team is or has been, it owes primarily to that Association. The team organized and went into the competition with a full knowledge of the conditions governing it, the precedents which had clustered about it, and the written and acknowledged rules of procedure in regard to it. American riflemen, far and wide, are free to give all honor to the men who so skillfully held up the honor of all

oughly mixed before loading, and a very little, just a priming, of black powder put in the bottom of each shell to make sure of proper ignition.

Jacksonport Ark., April 15, 1878.

increase the strength of shooting. Your correspondent, with eyes getting dim and nerves shaky, cannot hold fine enough for the close work of a choke-bore, consequently, especially for average shooting, prefers a
STRAIGHT-BORE.
NEWARK, N. J., January 5.

W. W. GREENER'S WEDGE-FAST HAMMERLESS GUN.

We have lately turned our attention to breech-loading guns without hammers. This description of arm offers many advantages, and it is the opinion of many sportsmen that it will eventually supersede the old style of gun with hammers. Of course there are objections to this new system, just as there were to the breech-loaders some twenty years ago.

The absence of the hammers makes the gun very convenient,

CHOKE BORES—A RETROSPECTIVE VIEW.

In the early history of the old, long, flint-lock fowling-piece, when ammunition was expensive, birds gentle, plenty and more in flocks, and it was an object for the sportsman to kill a large number at little expense, the prevailing gun was straight bored to within eight or ten inches of the muzzle, from which point it opened like a bell. These guns were common one hundred and fifty years ago. Occasionally we can find one in museums of sporting antiquities. As people who liked to shoot became more numerous and game less abundant and wild, guns of greater range were required, and gun-makers, up to the occasion, were making straight-bore guns by the close of the eighteenth century. Guns at this epoch were small bore, from sixteen to twenty being common sizes.

Early in the nineteenth century, in France, choke-bore guns were the favorites for fowling, and no doubt a few were made in England and other countries. About the time of Napoleon I., as it is to-day in this country and in England, France had the choke-bore fever badly. England stuck to the old cylinder, and, as the sequel proves, did wisely, and was the principal gun-maker in the markets of the world. The fact is, France was fifty or sixty years in advance of the demand for extremely close shooting arms.

The celebrated French makers of choke-bore guns, of flint-lock times, were Boutet, who was armorer to Napoleon I., Perin, Lepage, Paris, Armand, Pirmet, Delpire, Autelet, Briere, Gasset and others. It is true these makers bored guns as ordered, but the choke was the favorite. As early as 1810 Boutet, in France, occupied about the same reputable position for his modified choke as now Parker Brothers do in this country.

In proof of the foregoing we give a few extracts from "Le Vieux Chasseur" (The Old Hunter), published by Deyeux in 1835, page 28: "Je l'ai vu par un canon legerement espigone a l'orifice, serre au centre et libre au tonnerre, tel que de bons canonniers pretendent qu'il est mieux de les etablir; je l'ai vu par un canon etrangle de deux balles a l'orifice, et par un canon parfaitement cylindrique." (I have seen these results produced by a barrel slightly opened at the muzzle, choked in the center and free at the breech, such as some good gunsmiths pretend is best to make them; I have seen the same results by a barrel choked two sizes at the muzzle, and by a perfect cylinder gun.)

Page 36: "Le canon dont l'orifice est trop etrangle ne garnit presque jamais au centre. Le canon dont l'orifice est trop ou vert garnit extremement de pres et perd plus promptement sa portee qu'un autre. Le canon parfaitement cylindrique ne porte pas aussi bien que lorsque l'orifice est par une insensible diminution, retreci d'une balle au moins sur la longueur de 26 pouces." (The barrel, whose muzzle is too much choked, very seldom makes a good pattern in the center of the target. The gun, whose muzzle is too open, shoots very close at short range, but loses its strength quicker than any other. The perfectly cylindrical gun does not shoot as well as the one whose muzzle is by an insensible diminution contracted of at least one size on a length of twenty-six inches.) On page 62, after giving a description of a shot gun inclosed in a walking cane, he says: "On confectionne dans ce meme systeme de petites cannes a feu qui tuent tres bien l'oiseau avec 10 degres de prudence commune, mais, dans ces dernieres, l'orifice du canon est etrangle, pour donner plus de sucoes a une petite charge de poudre qui pousse avec senees une quantite double de plomb." (They manufacture in that same way small fire-canes, which kill birds very well with common powder; but in these latter the muzzle of the barrel is choked, to give more strength to a small charge of powder, which shoots quite well a double quantity of shot.)

Near the beginning of the present century there was existing at Tower Hill, England, an establishment for the manufacture of very fine guns; and these guns that have fallen under my notice, the barrels were about 3½ feet long, angle, cylinder bore, stub and twist, gold bushed, and the outside construction of the barrel was converged from the breech to within about nine inches of the muzzle, where, perhaps, it was about 1-16 of an inch thick, and from which point it diverged to full ½ of an inch thick at the muzzle. In the old flint-lock days, for gentlemen possessed of means, the Tower Hill gun was regarded a rare acquisition, as they really were guns of great power. It will be seen that, notwithstanding these Tower Hill guns were straight in the bore, by their external construction of the barrel, at the muzzle they choked or compressed the charge slightly. How much, really, is the question? Simply the thick rigid muzzle arrested the expansion that attended the passage of the charge through the barrel up to this point, and caused it to pass through a non expansive muzzle. Nearly thirty-five years ago, in New York city, Mullins made graded draw-bore guns. To give a general view of Mullins' plan, we would say: Start at the breech with half a size, contract up about eight inches three-eighths of a size, and from this point to the muzzle one-eighth of a size.

There are many of Mullins' guns (muzzle loaders) about now, and I do not know but Mr. Mullins is also. The guns were good, even, hard shooters. I have owned a Mullins gun twenty-six years, and for twenty years I only occasionally used any other.

Mr. Mullins used to regard venting guns as an advantage, and probably it did help the combustion of the powder and

especially for covert shooting.

In adopting a hammerless gun we have carefully considered the important questions of durability and simplicity, combined with safety and easy manipulation.

The wedge-fast hammerless gun will be found to possess these qualities in a high degree. The breech action has been well tested in every country for four years, and has been pronounced to be strong, durable and handy. The top lever is decidedly the best arrangement for the hammerless gun.

We adopt the Anson and Ducey lock arrangement for exploding the cartridge; the self-cocking is effected by the rais-

ing of the breech ends of the barrels for loading, and works smoothly and without requiring much force to open the gun and cock the locks, the great objection to other hammerless guns being the great force required to open them, but in the wedge-fast hammerless gun this objection is entirely overcome.

All the parts of the lock work are exceedingly strong and durable, especially the tumbler and sears. The locks contain fewer pieces than those of an ordinary gun (and the tain swivel, which is considered the weakest part of a gun lock, is altogether dispensed with), the needles or strikers and the nipples and hammers are also dispensed with, their office being fulfilled by the tumbler, the point of which strikes the cap of the cartridge. (See drawing No. 1, which shows the locks in a cocked position.)

There is no half-cock, but in its place there is a safety bolt that works on the left side of the gun, as shown in the accompanying drawing.

This is exceedingly simple, and effectually bolts the triggers from behind. It can be worked by the thumb of the right hand whilst gripping the gun. For extra safety the triggers may be bolted before the gun is loaded, and the bolt can be withdrawn (in the act of raising the gun to the shoulder) by the thumb. We can also make this safety self-acting by connecting it with the lever that secures the breech action. In this case it is necessary to unbolt the gun each time before firing, which would by some sportsmen be considered an objection. We, ourselves, are in favor of the safety bolt not self-acting as being more simple in construction.

This gun has already been thoroughly tested by a number of first-class sportsmen, who have expressed themselves as being highly pleased with its mechanism and performance in the field.

Besides the actions and safeties already described, we make the Westley Richards & Co.'s gun as they themselves make it, at two guineas extra.

Gentlemen in search of hammerless guns should, before deciding, inspect the wedge-fast principal, as it will meet all the requirements that a sportsman can desire. We do not approve of the self-cocking guns with the hammers on the outside, as made by some of the London makers, as they possess no advantage over the ordinary gun.

St. Mary's Work, Birmingham, England.

[Ado.]

PIGEON MATCHES.

HOW TO PREPARE SCORES.—In sending their scores clubs are requested to give the following particulars: Place, date, name of club and of the competition, kind of trap used, distance of rise, boundary and rules governing. To insure insertion in current issues of our paper, scores should be sent so as to reach us on Tuesday, and earlier, if possible.

HIGH SCORES AT THE TRAP.

JACKSON, Miss., April 24, 1878.

EDITOR FOREST AND STREAM AND ROD AND GUN:

I have noticed an advertisement of Mr. W. W. Greener in FOREST AND STREAM, in which he claims the shooting done by Mr. Cholmondeley Pennell, at Monaco, in February, 1878, where that gentleman killed 19 birds out of 20, at say, 29 and 33 yards (London Field says 32) rise, as "acknowledged to be the best shooting on record." According to the report of the London Field the birds shot at were not fast birds, and the "only flashing, twisting blue rock easily eluded Mr. Pennell." At the Nashville Field Trials in December, 1877, Mr. E. T. Martin, in a match with Mr. Tucker, killed 19 birds out of 20 at 40 yards rise, the latter killing 20 birds straight at 31 yards. In "the second event," Mr. Martin in a match with Mr. Cheatham, the former killed 15 straight at 40 yards rise, the latter 12 out of 15 birds at 31 yards.

Please remember the shooting at Monaco was under the Hurlingham rules, allowing both barrels; at Nashville only one barrel was allowed with 1½ oz. of shot. There are other scores on our record that would beat Mr. Pennell's, but I do not remember any but those of Messrs. Martin and Tucker. I am not a pigeon shot, and consider trap shooting but a sorry amusement, neither do I know any of the gentlemen above mentioned, and call your attention to the fact only because Mr. Greener's statement has been allowed to go unchallenged. Yours truly,

Geo. C. Eymon.

TRAP-SHOOTING EXTRAORDINARY.—Though not partial to pigeon-shooting myself, I have just received from Baltimore, Md., an account of the winning of a match over the traps well deserving a record in your widely circulating journal. Mr. Donnel Swan, one of twin brothers—both of whom I saw shoot bay birds at Cobb's Island before they were in their teens—laid a wager with some friends of the Maryland Club, that he would score ninety-four out of a hundred birds at twenty-one yards rise. He used a 12-bore 7lb. Down-gall gun, 3 lbs. powder, 1½ oz. shot; 21 yds. rise, 80 yds. bounds, H and T plunge traps, with the following results, which, while it would be remarkable in a veteran professional, is really astonishing for an amateur: Killed straight, 27, missed 1; killed straight, 11, missed 1; killed straight, 60; or 98 out of 100. The shooting was done inside of forty-six minutes. The shells were loaded by Alexander McComas, who was selected by the parties to the match. It will be observed that he used 12-bore guns. No larger calibre is tolerated by the Maryland Gun Club, nor by the clubs of Europe. This restriction should be adopted by our clubs generally, most of which, I believe, tolerate blunderbusses. The quail in this (Hamilton, Ohio) county, are exceedingly numerous this spring, and have already mated.

F. G. B.

THROWING GLASS BALLS.—Editor Forest and Stream.—In your issue of April 11 I notice "that S. A. Roberts did some novel shooting at glass balls at Buffalo," by having them thrown from behind him by another person. Over one year ago a friend and myself whilst at the pastime of glass-ball shooting were unfortunate enough to break the India rubber springs to our trap early in the sport, and were compelled to invent something to take its place, and before we had finished our morning's shooting we had, in my opinion, as excellent practice as it is possible to have, except at living flying birds. The method we adopted was the following: One of us stood close behind the shooter, who said "Ready," and as the ball was discharged from the hand in any direction, the word "Fire" was at the same instant pronounced firmly and sharply by the person discharging it. You would be amused to see in how many directions the shooter often looked before he could get his eye, much less the gun, upon the ball. We found it very exciting, and the word "Ready" from the shooter and "Fire" from the lips of the one delivering the ball, out of sight of the shooter, seemed sufficient to cover all contingencies. To vary this, one of us paced twenty-one yards directly in front of the shooter, and then turning a direct right angle to the right, proceeded some twenty-five yards in that direction and discharged the balls (at the same words "Ready" and "Fire") across the shooter at directly a right angle to him. This was also changed by discharging the ball from the left toward the right in the same manner. The balls were thrown exactly as a base ball is delivered, and they passed with great speed through the air, and the direction of flight, especially in the

LOGGSTS AND WILD HONEY.

Rev. Myron W. Reed, of Indianapolis, recently read before the Saturday Night Club, of that city, an essay on "The Shooting Mania." Mr. Reed betrays a thorough appreciation of, and participation in, the sportsman's spirit. He has succeeded in telling, not without a great deal of genuine humor, so much truth about this same shooting mania, that we need make no excuse for introducing him to the wider and equally appreciative audience, which he will find in our readers:

"Some men and dogs are gun-shy, but the rule is otherwise. The boy-baby tems toward a gun with native drift and instinct. There are people who, failing to catch the whooping-cough in childhood, are caught by it late in life. These have it 'buri.' So with shooting. A man may lead a blameless existence until the white dust of the road of life is in his hair, and then fall. The gun melody will utterly possess him. The outward symptoms are, a new and absorbing interest in sporting literature; he subscribes for the *FOREST AND STREAM*; he sends his measure to Holmby for a snit of dead-grass-colored raiment. It is 'borne in upon him' that he must have an English gun and a liver-colored dog. He studies geography that he may know where marshes are, and wheat-stubble and other likely places for birds. Railroads are of interest to him, as they tend toward these bappy hunting grounds. When there is no shooting by reason of the law or the season, it is no small satisfaction to him to clean his gun. He has been known to use up all the sewing-machine oil in the house—dividing it between the locks of his weapon and the sitting-room carpet; doing this on 'off nights,' when his wife was absent at prayer-meeting.

"All railroad trains that will take one to shooting grounds leave sometime between midnight and morning. The immediate family of the hunter are not altogether disinterested in this arrangement. On the night preceding his departure the watchman thinks from the light in the dwelling that there must be somebody sick inside, and there is. The whole household is sick, and it is an inexpressible relief when the spring-lock clicks behind the shells and gun and dog and man on their way to the station. An alarm-clock is a good thing for a shooting man to own. It would be better if one could remember whether he had set it or no. What with the night's vigil and breakfast eaten off the mantel-piece at an hour when no human being has an appetite, the hunter looks pretty haggard as he delivers his dog to the baggage master. It is the hour of night when the vital powers are at their lowest ebb. It is the hour when most people die. The atmosphere of the ordinary car at that hour is not bracing.

"Trains that carry men to good shooting grounds are all slow trains. The roads that lead thither are well provided with junctions. Some hunters are entertained at private houses, some at club houses, some live in tents. The private house, in the writer's memory, had a bed-room for six, and the sportsmen slept two in a bed, and between the beds—beds of feathers brought from the old country. The effect of this to one unaccustomed is peculiarly stimulating. Of six men one may be counted on to snore ably and with continuity. Club-houses vary in quality of comfort, and mere mention of tent life in November is enough. No use to paint the life.

"The early bird catches the worm. To catch the early bird the sportsman habitually has his breakfast in the night. To dress is to pull down his cap and get into a pair of clammy rubber boots. He takes down his cold gun and staggers out to his boat. It is sharp at both ends, and shallow and narrow. The more uncomfortable it is the better duck boat it is. Four o'clock sees the hunter on his favorite bog, pounding himself to keep his blood a-going, and waiting for ducks to come to him. There is an uncertainty about their coming. A sportsman has been known to sit a long morning singing a variation on Tennyson's "He cometh not, she said." Maniacs have been known to pace the seashore for years looking for ships to come in that have long gone down. The sportsman must have a patience kindred to that. It is forbidden him to pace the shore. He must suffer and he still. The sailor hauling frozen ropes suffers, and the soldier in the ditch suffers. They are hired to suffer. The sportsman pays ten dollars a day to work harder than he ever did to earn fifty; lives and suffers like an Indian, and does it for fun. Quail shooting hath this in it; that it exercises the whole man. No curling up on a cold day waiting for them to come. They are most likely to be where there are burs. One day's shooting will give employment for the rest of the week for the whole family in picking Spanish needles out of one's garments and flesh. It would facilitate the movements of the hunter and add greatly to his comfort if the farmers would, in building fences, be careful to have the top rail flat and the fence not quite so steep. If the top rail could be upholstered it would not be so trying. The occasional introduction of a stile, similar to that on which the Irish emigrant and Mary sat side by side, would meet a long-felt want.

"Quails do not fly properly. They lack

unity. Instead of scoring for a start they go any way, and by the time the hunter has selected his bird and leveled on him, he looks too young to shoot, and the hunter spares him. Quails must be taught to conform their line of flight to the direction indicated by the gun, or else a gun must be built that will take in more surface. Something modeled after the pattern of a mountain howitzer would be efficient. The novice at quail shooting ought always to hunt in company with abler men, fire when they fire, and if any birds drop, claim them. It requires as much nerve to retrieve birds as it does to shoot them. If one cares at all about making a show of game to his wife and children, he must learn to retrieve. It is astonishing how much lead a quail can carry and fly. I have seen one, bannicapped with the loads of seven barrels, make for the woods like a streak of brown lightning. In war one man is wounded or killed to every five hundred bullets shot in his direction. The life of a quail is a better risk than that of a soldier. Many a quail sits and sings "more-wet," with the emphasis on wet, who has been caught in a hail-storm of shot and never lost a feather.

"A cross between the quail and the common farm-yard hen is the ideal game bird. Then let there be coveys of this bird taught to have their habitat in some dry, pleasant grounds, say "Central Park," where the sportsman can go after a late breakfast in a hack.

"While I am writing this there are men who leave their slippers and their firesides and their wives and children, forsaking all these to stand on bleak runways, in six inches of snow, in northern woods, waiting for a deer a day to pass them on a run. One chance in a winter a day for a shot by a shivering man at a vanishing deer! It is the allurements of birdshot that draws. Men tire of an easy, comfortable existence, and must taste the tonic of frost and hunger and weariness—taste it until they have sympathy with Esau, who, coming in from hunting, and smelling hot soup, sold his birthright for a plateful. Curious it is how the memory of the disagreeable becomes dim. One thinks of the camp-fire, the pleasant company and the soothing pipe, and forgets the sleet, the chill, the fatigue and the ill luck. As a cold, historic fact, we remember that he never went on a hunt for fish or for game that he did not some time in the course of it call himself an idiot for coming. Nevertheless, that fact has no restraining power. He will go again and again. The native drift and instinct has come to him through a long line from grandfathers who had to hunt, and who sent the habit down. It is stronger than any personal experience, any skepticism of wife or child. Whatever it is in fact, pleasant is the memory of the bed of boughs and the crisp air of the morning. Pleasant is the remembered curl of smoke from the ambush of the hunter. The man who had a sore heel on a tramp always speaks of it with a grin."

Tiffany & Co., Silversmiths, Jewellers, and Importers, have always a large stock of silver articles for prizes for shooting, yachting, racing and other sports, and on request they prepare special designs for similar purposes. Their TIMING WATCHES are guaranteed for accuracy, and are now very generally used for sporting and scientific requirements. TIFFANY & CO. are also the agents in America for Messrs. PATEK, PHILIPPE & CO., of Geneva, of whose celebrated watches they have a full line. Their stock of Diamonds and other Precious Stones, General Jewelry, Artistic Bronzes and Pottery, Electro-Plate and Sterling Silverware for Household use, fine Stationery and Bric-a-brac, is the largest in the world, and the public are invited to visit their establishment without feeling the slightest obligation to purchase.

W. W. Greener's CHOKE-BORE GUNS,

Tried on Game in America.

Supplied by H. C. Squires, American Agent,
1 CORTLANDT ST., NEW YORK.

The Gun of the Future.

Samples of the Hammerless Gun now on exhibition, and orders taken by our agent. Guns to be delivered June 1.

See the Following Testimonials:

Sir—It is a pleasure for me to inform you of my high appreciation of the 10-lb. Greener breech-loader purchased of you last winter. I consider choke-boring, if skillfully done, as the greatest improvement in fowling pieces since the introduction of the percussion cap. It gives the maker complete control of the pattern, and greatly increases penetration. To prove this, I will give you the performance of this gun. The 32-inch 10-gauge barrels, charged with 4 1/2 drachms of powder and 1 1/2 oz. No. 6 English chilled shot, give patterns ranging from 25 to 350 pellets in 30-inch circle at 40 yards. The same charge of powder and 1 1/2 oz. No. 4 American shot gives 160 to 175 pattern, with penetration which kills ducks at 60 to 70 yards like a stroke of lightning. It is a characteristic of the choke-bore to show its greatest superiority in the large sized shot. What I am about to say will perhaps surprise you as much as the performance surprised me. On trial of the 12-gauge 28-inch modified choke-bore barrels, with 3 1/2 drachms of powder and 1 1/2 oz. of shot, I got about the same pattern and spread of shot at 25 yards as with the full choke 10-gauge barrels at 40 yards, with tremendous penetration. This is just the performance required of a gun for thick cover, in which you generally find such game as woodcock and quail, these birds being killed, with few exceptions, at from 15 to 24 yards.

COL. JOHN BODINE.

W. W. GREENER, St. Mary's Work, Birmingham, England.

AGENTS

FOR THE FOLLOWING CELEBRATED MAKERS

W. & C. Scott & Sons (winners at the International Gun Trial of 1873); J. P. Clabrough & Bro.; P. Webber & Sons, and Westley Richards.

Thomson's Hunting Suits and Oil Finished Grain Leather Shoe Packs.

Dizon & Hawkeley's Shooting Tackle.

Sturtevant Brass Shot Shells.

Bussey's Patent Gyro Pigeon and Trap, with case and 100 birds

Black's Patent Cartridge Vest.

This Vest affords the best arrangement yet invented for carrying cartridges. The weight is so evenly distributed that it is scarcely felt. Cartridges can be carried with the heads down in this vest, which is of great importance when brass shells are used, as when carrying them with the head up the weight of the shot often forces the wad forward, when bad shooting is the result.

AGENTS FOR THE UNION METALLIC CARTRIDGE CO'S. AMMUNITION.
Warranted the Best in the Market.

A New American Paper Shell.

Superiority of the Howard Shell over all others. First—Having a metallic reinforce it is gas tight. Second—The flat anvil used in the primer will not cause the expeller pins to break.

Third—The paper is of the best quality, and can be reloaded many times. Prices as low as any American shell. The heads of the shell are uniform to a gauge.

Try them. For sale by the gun trade generally.

SCHOVERLING & DALY, SOLE AGENTS,
84 and 86 Chambers St., New York.

76 Shooting Coat, Yachting Shirt, Gaiter

Thu largest assortment of SHOOTING GARMENTS in the World.

COCKER SPANIEL Breeding Kennel

OF

M. P. MCKOON, Franklin, Del. Co., N. Y.

I keep only cockers of the finest strains. I sell only young stock. I guarantee satisfaction and safe delivery to every customer. These beautiful and intelligent dogs cannot be beaten for ruffed grouse and woodcock shooting and retrieving.

SPIKE COLLARS.—Spike Collars, by means of which dogs of any age or breed, no matter how long hunted, or what the disposition, can be taught to fetch and carry, and to retrieve game in a most perfect manner, with no play about it. Dogs broken of gun-shyness and whip-shyness, made steady before and behind, and "to heel" steadily; prevents lunging on the chain, besides a much more extended sphere of usefulness. Price, with directions for using, \$3. Kennel collars, which no dog can get over his head, price \$1. Address M. VON CULIN, Delaware City, Del.

THE DOG BREAKER'S GUIDE.—Train your own dogs in the most artistic manner. "The Dog Breaker's Guide" sent for three cent stamp. M. VON CULIN, Delaware City, Del.

FOR SALE.—Being crowded for room we wish to dispose of some of the following: Franklin, imported English setter; Spaulwood, fine pointer; Gyp, fine pointer, bitch pup; Dash, imported Irish setter, winner of second at Boston. For prices, etc., address LINCOLN & HELLAR, Warren, Mass.

THE NEW SCALE OF POINTS.—Compiled from Stonehenge's new edition of "Dogs of the British Islands," and adopted by the Westminster Kennel Club to be used at the dog shows in New York. Sent prepaid on receipt of price, 50 cents, by "The Country Publishing Association," No. 33 Murray street, New York.

PURE MASTIFF PUPS, got by Robert L. Belknap's prize dog, Pluto, for sale, cheap. Address N. BOGUE, Batavia, N. Y.

FOR SALE CHEAP.—Four dark-red Irish setter pups, by imported "York," winner of prize for best Irish Stud Dog at Baltimore this year, and many prizes at other shows, out of red Irish bitch "Bess," by "Salus" Dash, winner of Parker Gun at Watertown, N. Y., out of Dr. Strachan's imported Belle. Address F. A. DIFFENDORFER, Lancaster, Pa.

COCKERS! COCKERS!

Sportsmen in want of first-class cocker spaniels write at once to ROBERT WALKER, Franklin, Del. Co., N. Y. Stock and delivery guaranteed. Price, \$15 each for dog or bitch or spayed bitch pups.

FOR SALE.—Setter pups, orange and white, well bred and handsome; dog, \$10; gyps, \$5; also, a cocker spaniel pup, of good stock, \$3. Address E. SHERMAN PEASE, Canaan, Conn.

The Kennel.

MARYLAND POINTERS IN THE STUD.

"PONTO."

Liver color, weighs about 57 lbs.; is a first-class field dog both on covers and single birds; has great speed and endurance, and is not afraid of briars. Was shown at Baltimore in the same class as Sensation, and was highly commended.

"BRAGG."

Lemon and white, weighs about 60 lbs.; litter brother to Tili, who took first premium for Native Pointers at New York, May, 1877.

Fee for Either Dog, \$20.

As regards performances of dogs in the field, would refer to Messrs. Clark & Snedder, Baltimore; Hon. J. E. Reymann, 1822 Spring Garden street, Philadelphia.

FOR SALE, one liver-colored pup, by Ponto, out of Ginger, whelped in August, 1877. Price for pup, \$15. Also, five dog and four bitch pups, whelped April 1, 1878, by Ponto, out of Ginger. Price, \$15, at eight weeks old, or \$20 per pair. Address MUIR-KIRK KENNEL, Muirkirk, Prince George's County, Md.

ENGLISH PRIZE, STUD, SPORTING AND NON-Sporting Dogs for sale. Greyhounds, pointers, setters, retrievers, spaniels, broke for the field, \$20 each; for the field and show bench, of gold pedigree, \$40 each; fox terriers, bull terriers, black and tan terriers, from \$10 each, all dead game, of good pedigree, and very valuable for breeding; better quality for the show bench, \$20 each. Also a few Yorkshire terriers, at \$10 each. The prize Yorkshire terrier, "Willie," will be sold. Winners of silver cup, Queensbury, first and silver cup Ulverston, and ten other prizes. All dogs will be sent to Messrs. Bampton & Steadish, Express Agents, 60 William street, New York. Drafts to accompany order, payable on Alliance Bank, London. Satisfaction is guaranteed by the advertiser, who is a judge and reporter of English dog shows. F. STEEL, Well Royd Farm, Stamp Cross, Halifax, England.

Auxiliary Rifle.

SHELTON'S Auxiliary Rifle Barrel for Breech-Loading Shot-Guns.

This barrel can be placed in a gun ready for use in a second of time with the same ease as a cartridge, and can be removed just as expeditiously. There is no wear on the rifle barrel, nor on the shot-gun, and it cannot get out of order. With this Auxiliary Barrel, which weighs about one pound, almost instantly a breech-loading shot gun can be converted into a most accurate rifle. The AUXILIARY BARREL will fit any standard make of gun of 10 or 12-calibre—calibre of rifle 22, 28, or 44, as desired. Length of barrel, twenty inches. The shells used with the best advantage are the Winchester Repeating Arms Co.'s cartridges, No. 32 and 33, extra long, and No. 44, model 1873. Send for a Circular and Price List.

AUXILIARY RIFLE BARREL COMPANY,

P.O. box 1,178.

NEW HAVEN, CONN.

TATHAM'S IMPROVED CHILLED SHOT. American Standard Diameters.

(RED LABEL.)

Gives greater penetration and better pattern than ordinary shot. Equally well adapted to choke-bore, modified chokes and cylinders.

Our chilled shot will be found free from shrinkage, more spherical, more uniform in size, harder, heavier and of brighter and cleaner finish than any other. SEND FOR CIRCULAR.

TATHAM & BROS., 82 Beekman St., NEW YORK.

Also manufacturers of PATENT FINISH, AMERICAN STANDARD DROP SHOT, and COM-PRESSED BUCK SHOT, more uniform than the ordinary moulded shot.

For Sale.

FIELD, COVER AND TRAP SHOOTING.

BY CAPT. DOGARBUS.

New and enlarged edition, containing instructions for glass ball shooting, and chapter on breeding and breaking of dogs by Miles Johnson. For sale at this office. Price \$2.

FOR SALE.—Webster's Dictionary, edition 1855, colored plates, \$3.00. It trials at \$12. (But twenty copies left.) I will send "Forest and Stream" or "Chicago Field," for one year, with "N.Y. Weekly Tribune" for five years, for \$3.30. Amplest references. W. McK. HEATH, 114 Main street, Cincinnati, O.

CITY AND COUNTRY PROPERTY bought, sold and exchanged. C. S. PECK, 8 West Twenty-fifth street, New York.

\$5 to \$20 per day at home. Samples worth \$5 free. Address STURSON & CO., Portland, Maine.

Wanted.

Decoy Ponds.

A gentleman will be happy to enter into correspondence with any party with the view of establishing Decoy Ponds for taking wild waterfowl in quantities, having had great experience in England, where he was very successful. The thousands of wild ducks that resort in winter to some of the Southern States can be made a source of great wealth at very moderate expense. The price of wild fowl in both the English and American market will justify any one entering into the enterprise. Address E. C. D., New Glasgow, Nova Scotia.

WANTED.—One hundred fresh prairie chicken eggs; at least one-half warranted to hatch. Apply, stating price and particulars, to RAMON, this office.

WOOD DUCK eggs wanted; also three pair wood duck. H. P. DEGRAAF, Bowery National Bank, N. Y.

TO FOND OWNERS—WANTED THE LEASE of a trout pond for a number of years; it must be supplied by living streams, and be at least three to five acres in size. Answers please state all particulars, whether stocked with trout, and if the pond banks are clear from trees. Address, Box 2,032, Post Office, New York.

TO EXCHANGE.—A new, highly-finished, splendid shooting mid-range breech-loading rifle, made to order by P. Weston, Worcester, Mass., for a first-class (new or second-hand) breech-loading double-barrelled shot-gun; must be in good order. Address W. H. WHEELER, Milbury, Mass.

Gunpowder.

THE
HAZARD POWDER CO.,
MANUFACTURERS OF
GUNPOWDER.

Hazard's "Electric Powder."

Nos. 1 (fine) to 6 (coarse). Unsurpassed in point of strength and cleanliness. Packed in square canisters of 1 lb. only.

Hazard's "American Sporting."

Nos. 1 (fine) to 6 (coarse). In 1 lb. canisters and 6 1/2 lb. kegs. A fine grain, quick and clean, for upland prairie shooting. Well adapted to shot-guns.

Hazard's "Duck Shooting."

Nos. 1 (fine) to 6 (coarse). In 1 and 5 lb. canisters and 6 1/2 lb. kegs. Burns slowly and very clean, shooting remarkably close and with great penetration. For field, forest or water shooting, it ranks as any other brand, and it is equally serviceable for muzzle or breech-loading.

Hazard's "Kentucky Rifle."

FFFG, FFG, and "Sea Shooting" FG, in kegs of 25, 12 1/2, and 6 1/2 lbs. and canisters of 5 lbs. and 1 lb. Packed in 1 and 5 lb. canisters. Burns strong and moist. The FFG and FFG are favorite brands for ordinary sporting, and the "Sea Shooting" FG is the standard rifle powder of the country.

Superior Mining and Blasting Powder.
GOVERNMENT CANNON & MUSKET POWDER.
ALSO, SPECIAL GRADES FOR EXPORT, OF ANY REQUIRED GRAIN OR PROOF, MANUFACTURED TO ORDER.

The above can be had of dealers, or of the Company's Agents in every prominent city, or wholesale at our office.

85 WALL STREET, NEW YORK.

Lafin & Rand Powder Co.

No. 26 MURRAY ST., N. Y.

Sole Proprietors and Manufacturers of

Orange Lightning Powder.

No. 1 to 7, strongest and cleanest made. In sealed 1 lb. canisters. High numbers specially are recommended for breech-loading guns.

Orange Ducking Powder,

For water-fowl, strong and clean. No. 1 to 5 in metal kegs, 6 1/2 lbs. each, and canisters of 1 and 6 lbs. each.

Orange Rifle Powder.

The best for rifles and all ordinary purposes. Sizes, FG, FFG and FFGG, the last being the finest. Packed in wood and metal kegs of 25 lbs., 12 1/2 lbs. and 6 1/2 lbs., and in canisters of 1 lb. and 1/2 lb. All of the above give high velocities and less residuum than any other brands made, and are recommended and used by Capt. A. H. BOGARDUS, the "Champion Wing Shot of the World." BLASTING POWDER AND ELECTRICAL BLASTING APPARATUS. ALL VARIOUS POWDER of all kinds on hand and made to order. Safety Fuse, Frictional and Platinum Fuses.

Pamphlets, showing sizes of the grains by wood cut, sent free on application to the above address.

SPLENDID FOR SHOOTING SMALL GAME and teaching up
CATS OR DOGS.Just the thing for Taxidermists to collect specimens. There is no report or danger attending its use, or any auxiliaries required to operate it. It can be loaded with ease and rapidly. It is extremely simple, and has no delicate parts to get out of order or wear out. For sale by the Trade generally. Sent upon receipt of price or C. O. D.
SEND FOR CIRCULAR. H. M. QUACKENBUSH, Patentee and Mfr., Herkimer, N. Y.Hart's Sportsman's Favorite Metallic Shells.
FOR BREECH-LOADING SHOT GUNS.

These shells are easily loaded, and the caps easily extracted from inside. Head solid and much thicker than any shell now made, giving a solid seat for cone or anvil, which prevents it from driving through or springing away, thereby causing misfires. The cone is made of nickel, and fastened solid in its place. Neither rusts nor corrodes fast, like movable anvil made from steel. The Nickel cone also prevents misfire when a nap has been left on shell for a few days, which is liable to occur either in steel or iron. These shells are finely finished, and made any length ordered, from 2 1/2 to 2 3/4 inches. Shells and Loaders and Descriptive Price-Lists can be obtained from all the leading Sportsmen's Houses HART & SLOAN, Newark, N. J.

FROM CAPTAIN BOGARDUS, CHAMPION WING-SHOT OF AMERICA.
Messrs. GONNARD E. HART & Co.—Gentlemen: The fifty shells I received from you to-day suit me better than any I have ever used. They are stronger and better in every respect, and I shall use them in all my shooting hereafter.
Yours truly,
A. H. BOGARDUS.

SHARPS' RIFLES---MODEL 1878.

FLYING TARGET.

(Patented August 7, 1877, No. 193,510.)

The way it came to pass was this: I to a sporting club belong; I love to shoot; I love to see the long-bill topping to the cope from whence 'twas dashed, or in its whirling flight the goodly grouse came uttering in the main sport, I joined the club, and I practiced at the gyro, glass ball, and the living bird, and as a substitute in the CHICKADEE and the HES? the Flying Target, I've contrived. For information, if you wish, or for a trap, address

E. M. LEAVITT, Auburn, Me.

"THE FISHING LINE."

Brook Trout, Grayling and Black Bass Fisheries
 of Northern Michigan,

VIA THE
Grand Rapids & Indiana RR

(Maakhuaw, Grand Rapids & Cincinnati Short Line.)

Sportsmen who have cast a fly, or trolled a spoon
 in the
Grand Traverse Region

will come again without solicitation. All other lovers
 of the Rod are invited to try these waters, wherein
 the fish named above, as also Muscalonge, Pike and
 Pickerel abound.

In no other streams east of the Rocky Mountains
 is the famous AMERICAN GRAYLING found in
 such numbers.
BROOK TROUT Season opens May 1.
GRAYLING Season opens June 1.

The Sportsman can readily and trophies of his
 skill to his friends or "Club" at home, as ice for
 packing fish can be had at many points.

TAKE YOUR FAMILY WITH YOU. The scenery of
 the North Woods and Lakes is very beautiful.
 The air is pure, dry and bracing. The climate is
 peculiarly beneficial to those suffering with
Hay Fever and Asthma.

The Hotel accommodations are good, far surpass-
 ing the average in countries now enough to afford
 the finest of fishing.

On and after June 1 Round Trip Excursion Tickets
 sold to Points in Grand Traverse Region, and attrac-
 tive train facilities offered to tourists and sportsmen;
 also Mackinaw and Lake Superior Excursion Tickets.
 Dogs, Guns and Fishing Tackle Carried Free, at
 owner's risk.
 Camp Cars for fishing parties and families at low
 rates.
 It is our aim to make sportsmen feel "at home"
 on this route. For Tourist's Guide, containing full
 information as to Hotels, Boats, Guides, etc., and
 accurate maps of the fishing grounds, send to
A. BOPPE, G. P. A.,
 Eastern Agent, 116 Market St., Phila., Pa.

TELESCOPES, FIELD, MARINE and OPERA
GLASSES, MICROSCOPES, SPECTA-
CLES and EYE GLASSES, ARTI-
FICIAL HUMAN EYES, ETC.

Is really wonderful. Illustrated catalogue mailed on
 receipt of postage of four cents.
 ESTABLISHED 1842

Sportsmen's Goods.

A
WHITE RIBBON.
Blue Ribbon
AND
SILVER MEDAL

Were awarded to Messrs. G. W. SIMMONS
 & SON, of Boston, Mass.,

Through their agents and exhibitors Messrs.
 Brown & Hilder, of St. Louis, Mo., at the
 Exhibition of the "St. Louis Bench Show
 and Sportsmen's Association," for an unusu-
 ally fine display of Duck, Mole-skin and
 Leather

HUNTING SUITS,
 which attracted great attention and were
 much admired by all Sportsmen.

THE BOSTON
SHOOTING SUIT.

Manufactured only by
G. W. SIMMONS & SON,

BOSTON, MASS.

NEW YORK AGENTS:

Fowler & Fulton,

303 BROADWAY,
The Best in Use.

ONLY ONE QUALITY MADE, AND THAT IS
 THE VERY BEST.

Flexible Waterproof, Tan-Color Duck.

Each article—coat, trousers, vest and hat
 cap—has the name and manufacturers' ad-
 dress stamped upon it, and no suit is genuine
 without it bears this imprint.

We make no discount except to the trade.

The price of the suit complete is \$13.

The material is of the best quality of duck,
 waterproofed by a patent process. The color
 is that known as "dead grass shade."

The seams and pocket corners are copper-
 riveted, and nothing is neglected to make the
 whole suit complete in every way.

This is what one of our best sportsmen says
 of it, writing from camp: "Although I had
 been nearly eight hours under incessant rain,
 laboring and striving along under adverse
 circumstances, yet I found myself compara-
 tively dry, and my clothes without a tear. For
 the benefit of our brother sportsmen, let me
 advise one of Messrs Simmons' (of Boston,
 Mass.) Waterproof Suits. Oh! what a relief
 it was to find one's tobacco was dry, and that
 one could light a pipe; that you could laugh
 at your miserable friend, who stood shivering
 and shaking as if he had the palsy; and then,
 next morning, oh! what fun it was to see him
 mending his clothes, while I had not a tear to
 complain of! Ventilation, that great bugbear
 of waterproof suits, is legislated for in the
 most ingenious manner. No sportsman should
 fail to supply himself with a suit which is at
 once cheap, practical, and will last an almost
 indefinite time."

Our Flexible Tan-Colored Water-Proof
 Leather Coats, Breeches, Vest, Leg-
 gings and Caps are considered the finest
 things ever made.

SCHUETZENFEST

The FOREST AND STREAM AND ROD AND GUN having given a gold medal for team shooting at the

SCHUETZENFEST

of the Sharpshooters' Union of the United States of North America, the Executive Committee of this Union takes pleasure in informing their American friends that they will make all arrangements for team shooting for this medal. The match will take place at the Schuetzen Park, Union Hill, on

Monday, June 24, 1878,

at 11 A. M. Each team to consist of eight men. Entrance fee, \$15 per team. The team making the highest score to win the Forest and Stream and Rod and Gun Medal. The entrance fee money, after deducting cost of markers, will be divided among the teams, pro rata. All the members of each team must be of the same society, and must have been members of it for ninety days previous. The entrance fee is to be paid on or before June 10, 1878, to Mr. F. HARENBURG, Treasurer of the Sharpshooters' Union, No. 120 Greenwich street, N. Y. Any ride club or shooting society of the United States will have the privilege of sending their teams without being members of the Union. Any communication directed to the secretary will be promptly replied to. GEO. AERY, President. T. BEHRENS, Cor. Sec., 37 Bowery, New York.

Send for Illustrated Catalogue.

FOWLER & FULTON, General Agents, 300 Broadway, N. Y.

Fisher's Muzzle-Loading Long-Range Match Rifle.

Interchangeable Grip and Heat Verner Scale, and Wind-Gauge Front Sight, with Spirit Level. Fine English Walnut Pistol-Grip Stock.

This Rifle requires no patent muzzle to load it. Uses the same bullet as the Sharps and Remington rifles. Loads the same as breech-loaders, where they do their best work, viz., from the muzzle. As Perry's Score-book says: "No shells to cart around and pay for. Can be used at one-half the expense of the breech-loader. With powder and balls always ready for a day's sport." Every rifle guaranteed. Breech-loading rifles at manufacturers' prices. All long-range rifles sighted and tested at Creedmoor without extra charge. Agent for F. WEBLEY & SON'S BREECH-LOADING SHOT-GUNS. Send for Circulars. H. FISHER'S Illustrated Catalogue and Score-book for Rifle Practice, price 25 cents.

HOMER FISHER, 260 Broadway, Cor. Warren St., New York.

Bogardus' Patent Rough Glass Balls and Glass Ball Traps.

These Traps are the only ones that give satisfaction, as they are simple of construction, easily set, and not liable to get out of order, and they throw the ball in a manner that more closely resembles the flight of a bird than any other trap in the market. The Patent Rough Glass Balls are made of uniform weight and thickness, and have a corrugated surface that strengthens the ball for shipment to any part of the country, prevents the glancing of shot, and thereby insures the breaking of the ball when hit. CAPTAIN BOGARDUS was the first to introduce the ROUGH BALL, and at a price far below the smooth ball at that time.

Balls and Trap can be ordered through all Gun Dealers. Liberal discount to the Trade.

DIY IMPROVED TRAP (warranted), which will throw a ball in any direction from the shooter at the option of the puller, is now ready for the market. Price \$8. Old style, \$6. Parties buying glass balls will receive, in each barrel containing 300 balls, a score book and rules for glass ball shooting, containing 40 pages.

HEADQUARTERS FOR BALLS, HAGGERTY BROS., 10 Plant Street, FOF TRAPS, HART & SLOAN, Newark, N. J.

Second and enlarged edition of "Field, Cover and Trap Shooting," by A. H. BOGARDUS, containing instructions for Glass Ball Shooting, and chapter on breeding and breaking of dogs by Miles Johnson. Price \$2, by mail, postage paid. Address, Capt. A. H. BOGARDUS, Ethbart, Logan (C. Ill. Dec 6 11

IRA A. PAINE'S FEATHER FILLED GLASS BALL. PATENTED OCTOBER 23, 1877.

The "Standard" Ball.

The Bohemian Glass Works would respectfully call the attention of all dealers in Glass Balls to the fact that the Paine Patent Filled Ball is the STANDARD AND ONLY BALL MADE TO A SCALE, therefore we would respectfully caution the dealers against laying in a stock of unsaleable articles for the Spring Trade, when you can purchase the Best Ball ever made at prices less than is charged for other inferior balls.

No other ball affords the PLEASURE of the Feather Filled Ball, and no other Ball is as beautifully made. It will break in every instance when hit by shot, and is sufficiently strong to prevent breakage either by transportation or falling on the grass.

Every ball is weighed and examined, then packed with the greatest care, in barrels of 300. Send for price list. Special inducements to the trade.

W. W. Greener's Champion Treble Wedge Breech-Loader.

THE WINNING GUN.

At the International pigeon shooting, Monaco, Feb., 1878, the Grand Prix de Casino, an objet d'art valued at \$169, and a money prize of \$105, was the greatest prize ever shot for at Monaco, was competed for by sixty-six of the best shots of all nations, and won by Mr. Cholmondeley Pennell, with a full-choke bore Wedge-Fast Gun by W. W. Greener, killing 11 birds out of 12 at 25 yards and 1 foot and 2 1/2 yards. He also won the second event, killing 8 birds in succession at 33 yards, making a total of 19 birds out of 20. This is acknowledged to be the best shooting on record.

The winning gun at the choke-bore match, 1877, beating 17 guns by the best London makers, and winning the silver cup, valued at 50 guineas, presented by Mr. J. Phrizey, the gunmaker.

The winning gun also at Philadelphia, 1876, in the pigeon shooting match between Capt. Bogardus and Mr. South for \$500 a side, South killing 98 birds out of 100, making one barrel only.

The winning gun also at the great London Gun Trial, 1875, beating 102 guns by all the best makers of Great Britain and Ireland. THE PATENT TREBLE WEDGE FAST BREECH-LOADER is the strongest and most durable ever invented, and the most successful gun of the period. Patented in the United States, Oct. 6, 1875; No. 163,323. BEWARE OF IMITATIONS OR IMITATIONS.

MANN'S

Trolling Spoons.

Our Trolling Spoons have been sold by the Trade, and used by the best fishers in the United States for fifteen years.

We have continually added, year by year, new spoons, such as by actual experiment and trial have proved the best spoons for taking fish. We now manufacture 59 different kinds.

OUR PERFECT REVOLVING

has proved to be the best Trolling Bait ever manufactured.

Dealers will please send for catalogue. We prefer the dealers to sell these Spoons at retail, but if not to be found at your fishing-tackle stores they will be sent by mail for one dollar each by addressing

For Forest and Stream and Rod and Gun. THE LOON.

A LAKE dark and lonely, from Nature's own hand,
Midst high towering mountains, wild, savage and grand,
Lies hidden secure, in its framework of green,
And reflects every object—rock, forest and stream.
From its dark surface oft, at close of the day,
Comes a cry, loud and shrill, from a far distant bay.

The sweet, timid doe, from the fastnesses still,
Seeks its lone sandy shore, to wander at will;
To nip tenderly leaves, bright grasses green,
And to playfully wander, a brown forest queen.
She listens! Again comes the sound loud and clear,
In shrill clarion tones to her listening ear.

The lone hunter sleeping 'neath rough-slant' of bark,
In the shade of the forest trees, sombre and dark,
Is roused from his slumber when daybreak is near;
With his head raised he listens! What sound strikes his ear?
Far off on the lake, 'mid the darkness and gloom,
He hears through the forest the cry of the loon.

With voice of a fiend comes that sound from the gloom,
Now laughing, now shrieking, like ghost from the tomb;
Now tanning, now crying, now screaming like mad,
As he floats free as air; on the wave he is king.
He rouses the wolf from his brush tangled lair,
And laughs, Ha! ha! ha! in the lightning's red glare.

At crack of the rifle, down under the wave
Like a dash he is gone—to a watery grave?
No, no! See, he rises and shakes his black wing,
And he floats free as air; on the wave he is king.
Yes, king of the solitude, king of the wave,
Then hurrah for the bird so lithesome and brave.

When the Storm King's abroad and wild breakers dash,
Oh, he laughs and he screams at the thunder's loud crash;
In the elements dire he is king of the wave,
'The wind and the waters his black plumage lave.'
Then hurrah for the bird of the wilderness wild,
In darkness and tempest thou'rt Nature's own child.
Oh, bird of the woods and the waters so wild,
Thy praises I'll chant, thou true Nature's child.

Windsor, Conn., April 7, 1878.

BALSAM.

Scenes in the Choctaw Nation. No. 3.

NEXT morning, after picking up our traps, we searched all around the glade for some sign of our road, but without success, and as the next best thing we could do, we struck through the woods in a north-east direction, knowing that we would in time strike some regular trail. We had no compass, and the sun was not up when we started, but we easily told our position by the moss on the tree trunks. In Marcy's "Army Life on the Border," I find the following paragraph relative to this mode of guidance:

"It is said that the moss upon the firs and other trees in Europe gives a certain indication of the points of the compass in a forest country, the greatest amount accumulating on the north side of the trees. But I have often observed the trees in our own forests, and have not been able to form any positive conclusion in this way."

My experience in this respect has been different from Col. Marcy's. I paid particular attention to this point during this journey, and noticed that every tree which had moss on at all, and most of them had more or less had the greatest amount on the north side of the trunks. These trees were mostly oaks, and perhaps in forests of other trees the rule would not hold good.

After travelling for several miles we met with an agreeable surprise in the shape of a traveled road; that is, a road in which were visible the tracks of wheels. It was the first sign of real progress we had seen in the Nation. We did not of course know whether this road led to Graham's Ferry, but we determined to follow it. It was fortunately the right one, and after a short ride along it, we arrived at Little River. This stream was not very wide, only about twenty yards or so, but the current was rather strong, and the water was apparently very deep. It ran behind steep banks, in which gulches had been cut to enable travelers to reach the ferry.

A short distance from the river bank was the hut of the ferryman, a very intelligent Choctaw, who spoke English tolerably well. His wife was a veritable squaw, a *fac simile* of those we had met on the road between Red River and Shawnee Town. There were, however, several bright-eyed boys, and one girl of about twelve years, who might well be called good looking, despite the coppery hue of her skin. Her features were regular, and her eyes were as large, dark and lustrous as a fawn's. If she retained her beauty for another decade one might easily imagine her a heroine of some border romance. Even young as she was, her superior appearance partially redeemed the whole race from the not very favorable opinion I had formed of them. The old

man and his boys ferried us across the river, and gave us directions as to the road to McCain's store, which he said was about twelve miles distant. He also gave us a couple of pounds of cold venison, for which, as well as for the ferriage, we paid him the customary "two bits."

After leaving the ferry the road was easily followed, and we saw much to interest us. The houses (log) became more numerous, and many of them were inhabited. We saw a number of corn fields, some of them surrounded with rude rail fences. In these fields we noticed Indians, male and female, engaged in cultivation. We noticed that invariably the men were better looking than the women, and some of them might have even been called handsome. Some of these corn fields were in natural openings, or glades in the woods, while others were planted in "deadening," a method of clearing greatly in vogue in the wooded districts of the southwest. The settler selects the ground for his farm, and then, instead of cutting down the trees, kills them by cutting a circle around the trunk deep enough to prevent the upward and downward flow of the sap. Land cleared in this manner is called a "deadening," and is equally as available for cultivation as though the trees had been cut down, while the labor involved is infinitely less.

About noon we reached the Arkansas line, and just across it was McCain's store, known to map makers as Ultima Thule. It consisted, so far as we could see (we didn't explore the suburbs), of a single farm house, with the store building about a mile distant, and not another building within sight. A negro whom we met directed us to the store, and we rode up to it, though it was somewhat out of our route. We found it filled with loungers, whites and Indians, who stared at us as we entered, as though we had been persons of some importance. The store was a regular museum, and its contents, having nearly everything one could wish to purchase, or at least, that was likely to be called for in such a jumping-off-place as Ultima Thule. The only eatables they could furnish, however, were soda crackers, and there was not an implement in the store with which we could extract the broken tube from Nichols' rifle. We purchased some crackers, and took a lunch while our ponies were resting. During lunch we made a calculation. We had not brought much money with us, expecting to live principally by our guns, which we had been assured, could easily be done, and on counting up our change we found that between us we had exactly seven dollars and forty-three cents, with which to reach St. Louis, a distance of nearly five hundred miles! Thus far the game had not shown itself, and now that my rifle was lost, and that of Nichols' broken, it would not matter whether we saw any game or not. Our only dependence for food was now our ready cash, and this was disagreeably scarce.

Our route from this time on lay over mountains of igneous rocks, pieces of which, strewn the road, made sad work with the unsod hoof of our ponies. Near the summit of one of the mountain ridges, we passed a small scrubby oak tree heavily festooned with Spanish moss. It stood all alone, and seemed out of place so high up, and so isolated from all its kin. I did not know that the *Tillandsia usneoides* grew as far north as this, for it had always been associated in my mind with live oak swamps and everglades. It might, however, have been planted, or transplanted, in this place by accident. We saw no other specimen during our journey. Traveling along slowly, we were overtaken by another traveler who carried a pair of enormous saddle bags, each of them containing a water-pail full of groceries. He informed us that he worked in a mine up in the mountains, and made pretty good wages. The metal obtained was principally copper, though small amounts of gold had been found. He said the woods around here were full of game—deer, bear and panther—and that a small village not far off had been named Panther from the abundance of those animals in that neighborhood.

All that day and the next we met with nothing of interest, if I may except the purchase of six eggs at an old hut, and two of which proved to be rotten. The people in the few houses we passed seemed extremely poverty stricken, and could rarely spare us anything to eat, and as a result we began to grow distressingly hungry. The next day was Sunday. Early in the morning we came to a store, the owner of which lived in a hut close by. We asked him to sell us some crackers or anything else he had to eat, and, to our astonishment, he refused to do so on the ground that the law forbade the selling of anything on that day. It was in vain that we expostulated, and declared that we were as empty as contribution boxes. The most he would do for us was to advise us to stop at the first house and perhaps they might sell us something, as the law did not apply to private parties, but only to stores.

At the house to which the store-keeper directed us we managed to procure a quart of corn meal and some salt, and this made into a mush in a tin pail, was all we had to eat till the afternoon of the day following. Had our guns been still available we could now have lived like fighting cocks, for here the game was very abundant. Quails and rabbits were often seen, and the cheerful "Bob White" of the former was constantly in our ears. At night, the lonely cry of the whippoorwill, and an occasional hoot from an owl, imparted an additional sense of loneliness to the woods. The blackberries, and the crops generally, were not nearly so far advanced here as those in the Nation, though the difference in latitude was only a few miles. At one spot we stopped for some time to examine what was to us a curious collection of mausole-

ums. When we first saw it we mistook it for a cluster of hen coops, but on a second glance we saw that it was a graveyard. Over every grave was built a small pen of narrow slabs, for the purpose, I suppose, of preventing the wolves from exhuming the bodies. We afterwards saw several cemeteries guarded in a similar manner.

For six days we continued our journey over those eternal mountains. It was up hill and down hill from morning till night. We passed through several towns—Waldron, Booneville, Ozark (on the Arkansas), Kingston and Berryville. Between the towns the houses were farther apart than angels' visits and not nearly so inviting, a general air of squalidness seeming to pervade them all. By stopping at nearly every house and trying to purchase food, we contrived among them all to procure enough to keep us from starvation. In the towns we usually laid in a good square meal, and, deceived by the genial influence of this, neglected to provide for the journey beyond. We got many interesting glimpses of unique characters, such as are probably commonplace enough in that region, but which struck us as being original. We noticed many queer ideas and many strange expressions. This last was especially true of their nomenclature of distance. During our ride we stopped at many houses to inquire the distance to the next town, and in no instance were we given intelligible answers. The people seemed devoid of all idea of distance as divided by miles. Some answered our inquiries with, "Waal, it's a right smart scope, I reckon." Others declared it was "a right smart chance of a ways." One informed us that it was "a mighty big step, I reckon," and another, most unique of all, asserted that it was not far, "only two straights and a crook." This last reminded me of the answer of a small boy to a traveler in Maryland, who had asked the distance to some point, "About two harks and a howl." Even when we planned them down to a definite answer we found by experience that their miles were very elastic, and usually stretched to treble their length. I remember once, the day after we left Ultima Thule, wishing to get some idea of our rate of travelling, we asked a boy how far it was back to that place. He replied, as sober as a deacon, "A hundred miles," a distance our ponies had walked in less than ten hours! One day we passed three different guide-boards, each about five miles from the others, and on each one we read: "Waldron, 45 miles." Not satisfied with such indications of slow progress, we asked the next man we met how far it really was to Waldron, and he confessed he did not know; that he had lived in this place fifteen years and had never been ten miles up that road!

There was another trait possessed by some of these people, which jarred harshly on our preconceived opinions. We had heard much of the hospitality of the southern people, and that many of them are hospitable it would be black injustice to deny. But we found exceptions. One night, just at dark we came to a house and stopped to get some food. We had had nothing that day, and were as ravenous as wolves. The woman of the house had only some corn meal, of which we bought a quart, offering for pay a dollar bill, the smallest change we had. The woman could not change this, and, as we had nothing smaller, she refused to let us have the meal until my companion untied his bundle and offered her a quire of note paper for the meal, when she reluctantly consented to the exchange. On another occasion, when the grass had almost disappeared on the mountain sides, and our ponies were nearly famished, we came to a farmer who had corn for sale, and procured "two bits" worth of him. He could not change a dollar bill, and talked as though we wanted to swindle him out of his corn, telling us, at the same time, of a man who went along that road not long before with a twenty-dollar bill, which no one could change, and boasted, when he arrived at Springfield, that the journey had cost him nothing. To silence this fellow's suspicious grumbling, I gave him an emerald doublet bosom pin which had cost me two dollars, which, I sincerely hope, amply repaid him for two dozen ears of corn. Even in Texas, the land proverbially hospitable, I have met with similar exceptions, having been forced on one occasion to pay ten cents for a hucket of water for my thirsty pony!

Our observations on the personal appearance of the people were not very favorable. The men had mostly the appearance of being extremely ignorant, lazy and filthy, and the women—well, perhaps it may be in accordance with Arkansas taste to see women smoking rusty clay pipes and chewing the eternal snuff stick, but it gave my conceptions of woman's inherent superiority over man a sad shock indeed. The younger women were, some of them, fair looking, but though women and the dead should never be spoken ill of, I must declare my belief in the superior personal charms of our Northern damsels compared with their sisters of the backwoods of the South. One thing caused us surprise. During the entire journey from Ultima Thule to Springfield, Mo., we saw only two negroes, and they appeared to be of a superior grade. The blacks of Arkansas must all be grouped in the eastern portion of the State.

As we proceeded northward we noticed that in direct proportion as the cotton fields became less abundant and wheat fields took their place, the appearance of the inhabitants likewise improved. There may have been no connection between these two circumstances, but the facts were there. The houses improved, the farms had a neater and thriftier appearance, and the countenances of the people seemed to bespeak more intelligence. Will some philosopher satisfactorily explain this phenomenon?

* On the twelfth day after leaving Texas we arrived at Berryville, a small town fifteen miles south of the Missouri line, and seventy-five miles south of Springfield. Here we were forced to part with our ponies. We had ridden them on very little grass, and still less grain, until they were so exhausted we feared another day's ride would break them down completely. I sold mine, with saddle and bridle thrown in, for ten dollars, while Nichols sold his saddle for eight dollars, and made a present of the horse to the purchaser. We then reduced our bundles to the lowest possible weight, and set out to walk to Springfield, where the nearest railroad passed.

That night (it was Saturday) we slept at a farm house, and the next morning, or rather forenoon, we arrived at White River. I was surprised at the crystal clearness of this stream. As we paddled across in an old dug out, the smallest pebbles on the bottom were plainly traceable, and the depth seemed only about three feet at the deepest, when in reality it was over seven. The banks on both sides were thickly wooded, and seemed like probable resorts for game, but the only living thing we saw was a solitary crane strutting about on a sandbar in the river.

North of White River stretches a tract known in that region as the "Wilderness." It is a tract about thirty miles wide, with no houses, and only one spring. The road through it runs in most places along the crest of a ridge or hill, and through a continuous forest of pines. After taking a bath we started on this, our last or home stretch, with buoyant hopes that the journey, of which we were becoming thoroughly sick, would be soon and easily ended. Alas, we learned that the sickliest part of the trip was still before us. "I will wager," says the devil in Bailey's Fables, "the great archangel's trump to a dog-whistle, that whatsoever happens worse ensues," and before the sunset of that June Sunday we were bitterly echoing the same sentiment. If I should live to the age of the Patriarchs I shall never forget the experience of that afternoon. Its memory haunts me now like the recollection of a horrid dream. If my words fail to impress the reader with its painfulness, let it be accounted for on the hypothesis that I am not skilled in the language of agony. Never very strong, the starvation diet to which I had been subjected for two weeks had made me still more feeble. I had imagined, during our long ride, from the relieved feeling of my limbs when out of the saddle, that a walk of a hundred miles would be a mere bagatelle, as it really might under other circumstances. The first day on foot I had stood it very well, but the next morning I was so lame and stiff I could hardly stand. In addition to this, that night a hug or something else got into my only goodeye—contraction of the cornea destroyed one of my eyes when young—and it was so sore and inflamed I could scarcely open it. Up to the time when we left White River I had, by continual resting, contrived to endure my aches and pains with equanimity, but after that they increased so as to be almost unendurable. We struggled along until about three o'clock, when it seemed to me that I should drop down at every step. The sun had come out extremely hot, and the reflection of the light on the road had increased the inflammation of my eye till the white was nearly all concealed by congealed blood. At times everything seemed to blur, and I could scarcely discern the road before me. The last jar caused by an uneven step or a sudden turn of the head caused sharp twinging pains to shoot backward through my head, and increased a splitting headache from which I had suffered all day. At first I tried to moisten my eye with spittle, but soon this source of alleviation was dried, for my throat and mouth became so parched I could hardly swallow. My lameness and weakness had been all the time increasing until it was with difficulty I could lift my feet over the smallest stick or stone or inequality in the road. Once I sat down to rest, and on trying to rise could only do so by clinging to a young tree near by. But my greatest suffering was from thirst. All along our journey thus far we had found plenty of water, and the cool, clear springs gushing from the mountain sides had been our only source of real, unalloyed enjoyment. But here there was no water save only at one spot we had not yet reached. At last we met a man who told us the spring was about four miles ahead, and we would know the place by several square yards of clover growing beside the road. Shortly after Nichols had an attack of colic, and, declaring he could go no further, lay down, telling me, as I suffered most from thirst, to go on to the spring and there wait for him. The time taken to reach that spring, though probably only about three hours, seemed to me an age. I staggered along like a drunken man, at times stopping and leaning against a tree to rest, not daring to lie down for fear I might not be able to get up again. At last I reached the clover patch where I had been told the spring was, but in order to reach it I had to descend a hill about twenty-five yards. After a while I got to the bottom, and after taking a good drink tried to reascend the hill, but found myself unable to do so. After resting about an hour, however, I succeeded in crawling on my hands and knees to the top, where, selecting the spot where the clover was thickest I lay down for the night, hoping, almost praying, that the morning's light would see me either refreshed and strengthened or would see me dead. I was not especially particular which.

It would not be the exact truth to say that my hopes were fulfilled. When Nichols came up and awoke me in the morning I was scarcely more fitted for travel than when I lay down. My nerves were in a healthier state, but every bone and muscle was in agony almost beyond endurance. Only the dread, which had now returned, of leaving my horses beside that road gave me courage and strength to go on. Nichols, who was stouter and stronger than I generously consented to exchange bundles, mine being heavier than his, and we started. My comrade took the lead and looked out for the road, while I followed mechanically behind, listlessly dragging one foot after the other. I can recollect but little of the details of the next three days' journey, only here and there isolated facts standing out holdily in my memory. I remember that in some way we passed over the distance intervening between the wilderness and the city of Springfield. I remember that that Monday morning we stopped somewhere at a house and got a breakfast of corn bread and bacon, and that at this house there was a huxom young woman with black eyes and bare feet, supporting a pair of well turned ankles. I remember that we stopped at another house to buy some wheat biscuits to munch along the road; that the proprietor of this house had a nose like the dawning of day, and prophesied a revolution if Government did not do something to alleviate hard times. I remember stopping at still another house, where we heard the news that the Republican convention had nominated Hayes and Wheeler. I remember that somewhere we had to swim a stream too deep to be waded, and that Nichols, carrying my bundle and panther skin, got them both soaked to the centre. I remember that we at last came to a region of fences, many of them inclosing magnificent looking farms, where the wheat was shoulder

high, and which were resounding with the clatter of reapers, and the merry badinage of the harvesters. And lastly, I remember that Wednesday afternoon we entered Springfield, tired and travel-stained, foot-sore and eye-sore, hungry and thirsty, with every bone and muscle and sinew feeling as though they had just emerged from the ordeal of the inquisition, and looking as wild and haggard as a Pennsylvania "tramp." The people stared at us as we walked on through the streets; the proprietor of a restaurant stared at us as he saw the viands he had placed before us disappear down our insatiable esophagi. The conductor on the train which conveyed us to St. Louis, stared at us, as we requested him to carry us to the city of mounds for eighteen dollars—all we could scrape together—when the regular fare was twelve dollars a head, but, like the gentleman that he was, he gave his consent to the arrangement. And when we arrived at home, our friends stared at us, and wondered whether I was really the same being who not six months before had left there to go to Texas.

It was more than a month before I regained my former condition of comparative health, and even now at times I can feel the effects of that long and wearisome journey. Still however, the lessons learned and the experiences stored up through that trip amply repay me for all the discomfort attendant upon it, and I cannot say that were a similar expedition placed before me to-day I would shrink from the undertaking.

Fish Culture.

MIGRATION OF FISHES.—No. 4.

BY G. BROWN GOODE—READ BEFORE THE AMERICAN FISH CULTURAL ASSOCIATION.

[Concluded from page 194.]

MENHADEN MIGRATIONS NORTH AND SOUTH.

There is no satisfactory evidence that the menhaden pursue extended migrations north and south. The same evidence which tends to show that the shad, salmon and alewife do not follow this course, will apply, with modifications, to the menhaden. The menhaden schools at different points along the coast appear to have individual peculiarities, corresponding to those of the shad in the different rivers. A Maine menhaden may be easily distinguished from the Long Island menhaden, a Chesapeake or a Florida one by certain indescribable characters easy to perceive, but difficult to describe. The presence of the crustacean parasite in the mouths of the Southern menhaden, and its absence from those of the North, is a very strong argument in favor of local limitation, in the range of menhaden schools. That the same school of menhaden return year after year to the same feeding ground is rendered very probable by the statements of Mr. Miles in paragraph 72. The schools in the Southern waters do not receive any apparent increment at the time of desertion of the North coast, nor are the Southern waters deserted at the time of abundance in the North. There is, however, a limited North and South migration. The Maine schools, on their departure in the fall, appear to follow the southward tread of the coast until they strike the hook of Cape Cod, where they are detained for some days, they then round the Cape and are again detained by the hook of Montauk Point. They first strike the shore at Point Judith and are turned over into Peconic Bay by the line of islands stretching across the eastern end of Long Island Sound. In the same way the Chesapeake schools are said to be detained for some days by the projection of Cape Henry.

The questions of hibernation and extended migration having been considered, it only remains to discuss the third alternative—that of the possibility of sojourn in the warm strata of the open ocean. In plate is given a diagram section of the North Atlantic Ocean between New York and Bermuda, showing the soundings and isothermal lines obtained in H. M. S. "Challenger," April 24 to May 8, 1873. The vertical scale is necessarily enormously exaggerated, but the diagram shows the presence of strata under the Gulf Stream and between it and the American coast, the temperature of which exactly meets the requirements of the menhaden. At a depth of 50 to 100 fathoms there is a shoreward extension of the warm stratum of 50 deg. to 55 deg., which extends inward 120 miles. There are no means of determining the corresponding isothermal lines on the coast of North Carolina, but an extension of much less degree would approach very near the shore in that region. The diagram represents the condition of the sea temperatures near New York at the very period when the menhaden are approaching the coast in April, and a similar relation (not improbable) exists, in November, at the time of their departure. The schools of fish, swimming out to sea when the shore waters become too cold for them, and driven below the surface by the winds of November, would naturally strike these temperate strata, and being kept from descending deeper by the uniform coldness of the waters below, as well as by the increasing pressure, and their efforts to approach the shore being also opposed by a temperature barrier, they would remain in the temperate strata until they were enabled by the warmth of spring to regain their feeding grounds near the shores.

No authorities can be quoted in support of this hypothesis, but in the case of the menhaden, at least, it appears to explain more of the difficult questions in relation to periodical movements than that of hibernation or that of extended migration.

(1) It presupposes less sudden changes of temperature than that of hibernation. It has been shown that hibernation of fishes is never voluntary, but is a state of torpidity induced, like that of aestivation, by a change of temperatures and surroundings, which they have no power to avoid. Before entering upon hibernation or aestivation, fishes retreat to the deepest water, and only become torpid when they are followed thither by the changed conditions of existence. In the fresh water of temperate countries fishes do not become entirely torpid in cold weather, but are sufficiently active to be taken with hooks from under the ice. This is also the case in sub-polar regions. The kallergritz, or American turbot (*Reinhardtia hippoglossoides*), is taken with hooks in the dead of winter under the floe ice of North Greenland, at a depth of 300 fathoms, in South Greenland, on the oceanic banks, at sixty and eighty fathoms, and at Fortune Bay, New-

foundland, it is captured in the shore herring seines at the same season.

So long as the menhaden can avoid the extremes of temperature, which they so carefully avoid in summer, by seeking congenial warmth in the ocean strata under the Gulf stream, need we suppose that they will plunge into the colder strata below?

(2) It involves less radical changes than hibernation in the habits of the fishes. Some fishes, like the mud-murrow (*Melanura limi*), of the eastern United States, are peculiarly adapted for a life in the mud. Others, such as the "compound breathers" (*Labryntes*), of India, are said to "respire" with ease with their head covered by liquid mud. Such fishes, however, are totally different in organization from the free swimming species of the open seas. All free swimmers are especially heedful to avoid contact with the bottom. This is especially so in the case of the herring family, of which the menhaden is a member. They are provided usually with deciduous scales, and never suffer themselves to come in contact with the bottom. If one of the herring or mackerel tribe is placed in an aquarium it will be noticed that it keeps itself always free from the bottom. Other fishes in the same tank, such as the sea-bass, tautog or king-fish, will be seen to rest on the bottom, and even to take refuge under the stones. It is extremely improbable that mackerel ever sink into the mud of the ocean bottom—still more so in the case of the menhaden.

(3) It accounts better than the other theories for the early appearance of the fish in the spring. Admitting a possibility of a winter's sojourn in the mud, we are met by a difficulty when we try to account for the prompt appearance of the fishes in the spring. The deeper strata of the ocean are now known to preserve throughout the year the uniform temperature of 35 to 40 deg. The fish, once mummified in the depths of the ocean, would remain so forever unless they possess powers unknown to exist in other animals.

On the other hand, if we suppose the fish to be swimming in the strata of mid-ocean, we know that they are just in the position to be susceptible to all the daily variations of temperature. Following with the advance of the season the inward curving of the Gulf Stream the warm strata below it gradually approaches the shore. The schools of fish are thus enabled gradually to draw nearer to the coast line, and when the strata of 50 deg. to 55 deg. in temperature touch the coast the menhaden are at hand.

(4) It explains as well as the hibernation theory, and better than the migration theory, the peculiarity of the different schools at different localities along the coast. This was discussed in paragraph 88.

(5) It explains better than the other theories, the appearance of the fish at the time of their arrival in the spring. The menhaden appear to be bottom feeders. If they migrated coastwise to the south they would find these feeding grounds. If they sank to the bottom they would find food, if they had sufficient vitality to resurrect themselves in the spring. If they passed the winter in the mid-ocean strata they could obtain no food and would naturally become emaciated, the accumulated fat of the preceding summer being absorbed.

Rimbaud's classification, which is a modification of one recognized in the markets of South France is very suggestive, but it does not appear to me to be entirely applicable to the fishes of our coast, at least not in the way in which it has been usually adopted.

Rimbaud makes four divisions, viz.:

- I.—Wandering fishes (*Poisson nomade*).
- II.—White fishes (*Poisson blanc*).
- III.—Bottom fishes (*Poisson de roche* or *Poisson de fond*).
- IV.—Alien, or outside fishes (*Poisson forain*).

The distinction between classes I. and IV. does not appear to be very clearly marked. In the western Atlantic some of the fishes making up class IV. belong to each of the other classes.

A more natural classification would be its three divisions which might readily be correlated with the three kinds of migration mentioned in the preceding paragraph.

The first group would include the wandering fishes, the *Poisson nomades* of Rimbaud, whose migrations are entirely oceanic, and confined to the surface zone. The second group would include the bottom fishes of restricted range, the *Poisson de fond* of Rimbaud, which move to and from the shore or the shallows, and which do not range.

The third group would include the middle classes, those which take advantage of both methods of migration, and corresponds approximately to Rimbaud's second division. "White fishes" seem hardly an appropriate name. Coast fishes would probably be more expressive.

Col. Lyman in his report "On the Limits of Artificial Culture, and the Possible Exhaustion of Sea Fishes," p. 67 (Report of the Commissioners of Fisheries of Massachusetts for the year ending, January 1, 1870, pp. 53-67), speaks of the first class as the wandering or "schooling" fish of the high seas. The term schooling is liable to mislead, for the "white fishes" also school. Among the wandering fishes he mentions only "the herring (*Clupea elongata*), mackerel (*Scomber venalis*), menhaden (*Alosa menhaden*), cod (*Gadus morhua*), etc." The cod and herring most certainly are "white fishes," and the menhaden and mackerel are certainly not to be ranked with "those which appear on the coast only when migrating" and then in vast but uncertain troops," p. 68.

A provisional classification by habits of the fishes of our eastern coast might stand somewhat as follows:

I.—Wandering or Surface Fishes.—These remain in our waters only for a short time, their movements being capricious or accidentally directed by the ocean currents, or else in search of food. They do not spawn on our coast, and their young are never seen in our waters. The best known examples are the sword-fish (*Xiphias gladius*), the spear-fish (*Tetrapturus albidus*), the bonito (*Pelamyx sarda*), the tunny (*Oryzenus thynnus*), the dwarf tunny (*Oryzenus alletteratus*), the cerces and Spanish mackerel (*Cytrium maculatum*, *C. caballa* and *C. regale*), the rudder fishes (*Halatractus zonatus*, *Nancrates ductor*), and (*Palinimichthys pereiformis*), the dolphin (*Coryptæna*, two or three species), the remoras (*Echeneidæ*), the barracuda (*Sphyræna borealis*), the lady fish (*Conorhynchus albus*), the tarpon (*Megalops thersoides*), the Oceanic sharks, such as *Galeorhoa tigrinis*, and the numerous waifs from the West India fauna. Of these only the sword-fish bonito and the cerces and Spanish mackerel are of economic importance at present.

II.—Local or Bottom Fishes.—These remain in our waters throughout the year, their movements being chiefly to and from the shore, though many of their species move for long distances up and down the coast. They prefer a somewhat uniform temperature, which they secure by going into the shallows in the summer and deeps in the winter in the northern districts of their distribution, while in the southern districts of distribution their movements are reversed. They spawn on

our coast, usually in shallow water and during their shoreward sojourn. The principal representatives of this group are the goose-fish (*Lophius piscatorius*), the flounder and flat fishes, the halibut (*Hippoglossus vulgaris*), of whose spawning habits little, however, is known, the lump-fish (*Cyclopterus lumpus*), and the two species of *Liparis*, the cod (*Gadus morhua*), haddock (*Melanogrammus aeglefinus*), pollock (*Pollachius canadensis*), and the hakes (*Phycidius* and *P. americanus*), the gurnards and sculpins (*Prionotus* sp. and *Cottus* sp.), the rose fishes (*Semotilus* sp.), the tanog (*Tautoga onitis*), and the hogset (*Ctenolabrus bergall*), the skates, the rays and the ground sharks.

III.—*The Coast or Ranging Fishes.*—These are in our coast waters for a portion of the year, and when absent from them are supposed to retreat to the depths of the ocean. When near the shores their movements are a combination of those of the two previous classes, and they wander widely up and down the coast. They spawn upon our continental slope, some entering the rivers, some upon the in-shore shallows, and some upon the off-shore shoals, their young coming to the shores with the parents. They all are summer visitors in the northern districts of their distribution, though some, like the herring, only appear in New England in the winter. The best known examples of this group are among the river spawning, or anadromous species, the salmon (*Salmo salar*), the shad (*Alosa sapidissima*), the idewife (*Pomolobus mediodors*), and, perhaps, the striped bass (*Morone saxatilis*), and the smelt (*Osmerus mordax*). Among the shore spawning species in the North the capelin (*Mallotus villosus*), the lance (*Ammodytes lanceolatus*), and the herring (*Clupea harengus* in the South), the scupping (*Stenotomus argyrops*), sheepshead (*Archosargus probatocephalus*), the sea bass (*Centropomus atramis*), the whym (*Chirostoma notatum*), the mullet (*Mugil sp.*), and the mackerel (*Scomber scombrus*); and among the off-shore spawners, the pompano (*Trachinotus carolinus*), the sea-tongue (*Cynoscion carolinensis*) and the menhaden (*Brevoortia tyrannus*), and probably the (*Pomatomus saltus*).

SALMON IN THE CONNECTICUT.—Yes; three salmon at one haul, and more superb fish it is impossible to imagine. At last the labors of the State Fish Commissioners are being rewarded. The movement of the fish in the river is undeniable. People may be skeptical, but there they are. This morning (Wednesday), at Mr. Blackford's in Fulton Market, we saw the most superb salmon we ever set eyes on. It weighed eleven pounds, was a clean fish, and it came from the Connecticut. This means over and over again that fish culture is not a theory, a visionary thing, but a practical fact. The general public read about so many eggs having been secured, and all about their hatching, and that is an end of it. The great, greedy public now is satisfied, we hope, with the result. One, two, three—say that a dozen fish only are caught this season; they are the *about* carriers of more. Eleven pounds of actual salmon which can be cooked is worth 10,000,000 of eggs in a hatching-house. We will grant you that. Still, let us, after the first expansion of pleasure, say a kind word for these "scientific persons," who have been preaching fish culture for so many long years. Let us not despise these minute eggs, and even the long paragraphs which have been written over them. As acorns produce oaks, so have these tiny eggs made the silver-sided salmon. The public have had a good deal of patience, and let us be thankful for this, which is not an American trait. The trouble has been that the great American people have, in their blessed ignorance, imagined that an egg put into a stream one week would produce absolutely a ten pound fish in the next fortnight. All that fish-culturists or fish commissioners can do is to assist nature the best bit in the world. Nature cannot be forced; that's the whole secret of it. But, when one thinks of the great trouble these fishenturists have had; how fishways had to be built; how private enterprise was often opposed to public good; how the fish themselves had to fight against almost nature for an existence in new streams, it is God's wonder how the adult salmon have ever been caught at all in the blue Connecticut. Now, what we want is good, positive protection for the fish. Our inventive power as to fish culture, at present, is in advance of any people in the world, but our administrative functions are null. People must open their eyes to such matters. What we want, then, for years to come, are stringent laws for the protection of the fish. The replenishment of streams by artificial means will make but little impression, if we over-fish. It is that natural sequence of fish that should be most depended upon. Fish culture is only an adjunct to the re-peopleing of our rivers.

Concerning these salmon, Fish Commissioner, Wm. M. Hudson, writes from Hartford:

"Though we tried to procure a law to protect them from capture until July 1880, we were unable to effect it. We can only hope that the reappearance of so many will induce the legislature at its next session to pass such a law for their protection as will determine the question of their restoration to the Connecticut, in which they were formerly so plenty."

LOOK OUT FOR CALIFORNIA SALMON.—Prof. Baird is exceedingly anxious to get early reports of the presence of California salmon in our waters—say anywhere, either in the Mississippi or this side of it, and we are requested to call the attention of all fishermen to the differences which exist between the Atlantic salmon and the California salmon. The distinguishing point is as simple as can be. The California fish have a considerably larger anal fin, with three or four more rays than the Atlantic fish. They are, when adult, thicker, broader, more clumsy in appearance, and, for the same length, the California salmon will weigh more than the Atlantic fish.

TROUT HYBRIDS.—An inquirer asks how the California trout can be crossed with our speckled brook trout, when it so happens that one variety spawns in the spring and the other in the fall. Our omniscient friend, Seth Green, explains this apparent difficulty by stating that our brook trout begin spawning in October and continue to spawn until the last of

March. March is the month in which the California trout spawn; so the problem becomes intelligible and lucid. *Saves?*

FEEDING TROUT.—I notice that the author of "Domesticated Trout" and others, say that trout fry should be fed three or four times each day until cold weather, and that they should be kept in the shade. I never feed my young (or old) trout oftener than once a day from their very first meal, and I give them all the sunshine attainable until June 1, after which date they should have shade provided to seek when they desire it, and healthier or larger fry than mine I think it would be difficult to find. My reason for feeding them but once a day is that the fish have time to get hungry between meals, and therefore will glean all the food which may fall to the bottom. Mr. Stone says they will not eat the food that has fallen, which therefore remains to foul the water. My fish do gather it all and ask for more.

In regard to sunshine on the trout, I would say that two months since I placed five thousand fry in a pond shaded with a roof. They were dying by hundreds each day without apparent cause. I moved them at once to a pond the same size, supplied with water from the same pipe, but fully exposed to the sun, and the mortality ceased within twenty-four hours. Yours truly, THOMAS CLAPHAM.

Troutbeck, Roslyn, L. I., April 23, 1878.

A NEW SPECIES OF FISH ON THE COAST.—Professor G. Brown Goode writes us as follows:

"A new species to the coast just received from C. C. Leslie, Charleston, S. C. It proves to be *Rhomboplites aurorubens*, before known from Jamaica, Martinique and Dominica. It is known as the *Mangrove snapper* in Charleston Market. These specimens were taken on the Savannah banks."

LAKESTRINE JURISDICTION.—Last week, in replying to a Boston correspondent, F. W. C., regarding rights in pond property, we answered to the best of our ability with the light furnished us. We are therefore greatly obliged to the correspondent whose letter is appended herewith, for his assistance in stating the case more fully, and consequently making it more intelligible. We quote:

SALEM, May 4, 1878.

EDITOR FOREST AND STREAM:

I have read in your issue of May 2 a communication from "F. W. C.," together with your answer, with much interest. I think your correspondent must refer to Humphrey's Pond, in Lynnfield, Mass. If so, I think I can explain the matter to his satisfaction. This pond is one of two or three in this State which were granted before what is known as the "Colonial Act of 1641" was passed, and are therefore private property, and not included among the "great ponds" of the State. The State Commissioners were consulted in the matter, and advised that no license was good, and gave no right title to the fish and fishing. In regard to the stocking of the pond, that was done by one of the owners at his own expense; the State had nothing to do with it.

F. T.

NEW YORK.—On Thursday, April 25, 100,000 salmon trout were put into Lake Ontario at Charlotte from the State hatching house at Caledonia. Also 30,000 of brook trout into Allen's Creek, at Wheatland Station, and 5,000 trout into Blue Pond, all from the Caledonia hatching house.

—Two more large salmon have been taken in the Delaware. One of them, which weighed twenty-two pounds, was sent to Gov. McLellan.

PENNSYLVANIA FISH CULTURE.—L. J. Wilt, of Franklin, Pa., has been appointed Fish Warden for Venango County, Pennsylvania.

Three thousand brook trout (fry) were recently received from the State Commissioners of Fisheries in good condition, and distributed in the several streams in this vicinity.

W. C. Parker, Esq., of Sugar Creek, has a very fine private pond, in which the trout show up to thirteen inches.

CALIFORNIA.—The Fish Commissioners of California have, during the past month, made several large distributions of land-locked salmon and eastern trout. Ten thousand eastern trout were put into Alder Creek, Donner Creek, Prosser Creek and Mardis Creek, tributaries of the Truckee; five thousand eastern trout into the Klamath River, Tulare county; ten thousand land-locked salmon into San Francisco and other creeks of San Mateo county; twelve thousand eastern trout and land-locked salmon have been distributed to Espinosa and Pajaro Lakes, Gabilan and other waters of Santa Cruz and Monterey counties; five thousand land-locked salmon have been put in a reservoir in San Mateo county, for breeding purposes exclusively; five thousand eastern trout went to the headwaters of San Francisco Creek; eighteen thousand McCloud River trout have been put into Santa Rosa, Mark West, Sulphur and other creeks of Sonoma county. On Saturday last 15,000 Eastern and McCloud trout were sent to Pescadero, San Gregorio, San Mateo, Aptos and Los Gatos creeks. A lot will be put into the headwaters of Alameda creek, and the remainder of the land-locked salmon which the Commissioners have on hand will be sent to Tulare Lake.

Natural History.

NOTES ON THE BIRDS OF HALIFAX INLET, EAST FLORIDA.—No. 1.

QUAIL.—*Oryzopsis virginianus*. Bonap.
WILD TURKEY.—*Meleagris gallopavo*. Linn.
GROUND DOVE.—*Chamaea passerina*. Swain.

The quails are very abundant in the scrub, being seldom molested by gunners. They are smaller and of a darker color than those of the Northern States. The wild turkeys are growing scarcer every year. Many have been drowned in the heavy spring floods of the last two or three years, and the nests have been broken up by the same cause. There are also many more hunters here than formerly, and some of those from the North are so reckless as to kill the hens in the breeding season, when they are really worthless for food. The ground dove is a beautiful little bird of domestic habits, which frequents door yards and gardens, often feeding among the poultry.

FISH-HAWK OR OSPREY.—*Pandion halietus*. Cav. This is a very abundant species here, owing to the abundance of fish food. They breed in great numbers on the mangrove island, and other inaccessible places, and seem to get a good living, notwithstanding the depredations of the eagles. The mullet

is their favorite fish, and is plenty at all seasons. I have seen them take the salt water trout and whiting, and have twice seen a fish-hawk pick up a dead catfish from the surface of the water. I should think, from my own observations for the last eight years in this river, that the eagles rob the ospreys of one half the fish they catch.

Yesterday, while out hunting in my boat, I saw an osprey descend and capture a fish. Soon an eagle was in chase. The osprey tried to escape by doubling, by ascending and by descending, but the eagle pressed her so hard that she did not venture on a direct flight for some time. At last she got a fair start, and I was hoping that she would escape, when a second eagle appeared on the scene. One attacked the poor hawk above and one below, so they soon made her drop the fish, which the lower eagle followed to the water, but failed to secure, much to the gratification of the spectators. As the food of the osprey is fish alone, she never depredates on mankind, and is consequently unmolested, except by those idiots who want to kill every thing they see. So the osprey has little fear of man, and carries on her fisheries near houses and boats, and in this way sometimes escapes the attack of the eagle, who is more suspicious of the human race, and keeps out of shot range.

WHITE (HAKED) OR BALD EAGLE.—*Haliaeetus leucocephalus*. And. Why this eagle should have been called bald is a mystery, since she is no more so than Wm. C. Bryant himself, and has as well covered a head. She is no doubt a robber, and lives by the plunder of her weaker neighbors; but many great nations, crowned kings and blind knights, have got rich in this way without incurring the world's reproach. Being very fond of fish, and not knowing how to catch it herself, she is obliged to avail herself of the services of the osprey, who is her unpaid servant or slave. When these services are not to be had, the royal bird condescends to eat crabs, and many sometimes he seen seated on the carcass of a dead hog, surrounded by a circle of turkey buzzards, who wait respectfully while their master satisfies his appetite. This eagle will sometimes, in failure of fish, prey upon ducks and herons, and in the interior of Florida will carry off poultry and young pigs. The fishermen on the coast say that in the fall, when they take great quantities of fat mullet with nets, the eagles will watch them, and if the heaps of fish are unguarded, will descend and carry away all it can grasp, always selecting these with the roe. I do not hear that this eagle is known to fish for itself, but will often pick up a dead fish from the surface. It is an abundant species here. I have observed five or six in sight at one time on this river, and most of them in chase of the osprey. If any one wishes to see a structure which combines the largest amount of power contained in a given weight, let him dissect an eagle. The body is a mass of leathery muscles and wire-like cords and sinews, almost defying the sharpest knife.

S. C. C.

THE MINNISCAGO.—Apropos of this monster, an account of which was given in a recent number of FOREST AND STREAM, a distinguished zoologist writes to us, suggesting that there is no inherent improbability in the story which comes to us from South America. The animal is no doubt extremely rare, and might escape capture for a long time. It must be remembered that the country where it is supposed to exist is almost unknown to zoological collectors and naturalists. Our correspondent says:

"But little appears to be known of the animal, excepting from its works, although in one or two instances it is said to have appeared above the surface, very soon to bury itself again. In several cases, when the soft earth has been turned over as by a plow, an impression of its paws or scales was distinctly visible, which would be an additional argument of the armadillo-like character of the beast. Estimates of its dimensions vary greatly, but upon the whole there seems to be some foundation for the belief of the existence of a subterranean animal, probably a mammal of gigantic size, and not known to naturalists."

The fact that no specimen has ever been captured or even seen by naturalists is no argument against its existence, as it is probably extremely rare; and as there are numerous species of burrowing animals, such as moles, pouched rats, etc., which are very seldom seen, even in regions where they abound to a prodigious extent, their ridges may be seen in every direction, but the animal itself remains invisible."

TRAIL'S FLYCATCHER.—Editor Forest and Stream: In my letter last week to the Linnaean Society, among other changes as printed in your paper, the word "genus" is substituted for where I wrote "form," and the quotation marks are left off from "trailii." The impression then perhaps given was that but one species of *Empidonax* occurred across the continent. To many, however, the context would prevent a misunderstanding.

The only occasional breeding of the Little, or Trail's Flycatcher, (*Empidonax pusillus* "trailii") within the limits of the Alleghenian or even the Carolinian fauna in the Eastern coast States, is interesting as compared with its doing so regularly in Southern Ohio, Indiana and Illinois. With us the bird has been considered quite typical of the Canadian fauna, and practically is so still.

ff. A. PONDIE.

Boston, April 27, 1878.

AN ALBINO.—On last Wednesday, while out gunning for snipe with my friend Mr. A. D. Boas, as we were coming home we noticed a bird of some kind, with white plumage on the back and a red breast, fly across our path. Mr. Boas immediately followed it and succeeded in killing it. Upon examination we found the feathers on the back very nearly white, and close to the top of the wings, and under the wings, of a delicate salmon color. The plumage of the breast was exactly like that of a robin. The head and beak also resembled a robin's. We showed it to a great many persons, and they were unable to tell us what it was. It you can from this description tell us anything about it we would feel very much obliged. I should note that the eyes were not red, as is usually the case in an albino. I cannot close this letter without telling you how much I enjoy your paper.

Yours,

Geo. D. KELLER.

Carlisle, Pa., April 27, 1878.

[Your bird was probably an albino robin. Albinos do not always have pink eyes.—Ed.]

FLIGHT OF QUAIL OVER WATER.—Editor Forest and Stream: Noting the article in your issue of April 18th on "Inability of Quail to Fly Across Wide Rivers," reminds me of some of my own experience, which may be of interest. I have seen coveys try to fly across the Mississippi and Missouri Rivers,

some succeeding while others of the covey were obliged to light on driftwood, and three fell on the deck of a steamboat on which I was traveling, so much exhausted as to be easily captured by some of the deck hands. Once when hunting in Texas I succeeded in getting a covey nicely scattered on the edge of the bank of the Colorado River, where it was about 300 yards wide. All that were flushed seemed much averse to flying across the river; there being no cover for them we killed nearly all, a few that did cross the river seemed much exhausted and confused when they reached the opposite bank, dropping down quite heavily and lying perfectly still, not attempting to run or hide. I shot and killed one about 20 yards from the bank only to see it swallowed by an immense gar, almost before it touched the water, leaving only a few ripples and floating feathers to gaze upon. In Virginia on the banks of the James River, where it is over 500 yards wide, I have followed coveys of quail from one bank to the other and back again many times, but only late in the season when the birds are fully grown and strong. A noticeable characteristic of Virginia quail, is their adroitness in eluding a dog by taking to trees; I have seen them run on the ground in pine thickets, until hard pressed by the dog, and then hop into the lower branches, letting the dog pass under them and then fly (often noiselessly) to a more secure shelter in the thick top of some large pine. I have seen good dogs put to their wits ends by such behavior. When a covey scatters in a clump of pines, flying from tree to tree, the dogs wind them everywhere, but seldom are able to get a point. C. B.

N. Y., April 19, 1878.

RUFFED GROUSE IN TEXAS.—We learn from an army officer now on duty in the Southwest that he saw last November five ruffed grouse in the "Brown Sand Hills," almost in the centre of the Staked Plains, west of Cedar Lake (the water of which, with the exception of one small spring, nothing can drink). Ruffed grouse are migrating to Texas in large numbers, and the Indians and old citizens say that it is only within the last two or three years.

BREEDING OF BEARS.—A correspondent writes us to say that old mountaineers have told him that no man ever killed a female black bear that had cubs in her. He says that this idea is new to him, and asks us whether we can give any instance of the kind. This belief is a very widespread one and is well nigh universal among hunters of the old style. We have heard the same thing alleged in regard to squirrels. The fact appears to be that both bears and squirrels keep themselves so close during the period of gestation that it is extremely unusual for a pregnant female to be killed. With the black bear we have had no experience, but we know that the grizzly brings forth her cubs early in January, and that at birth they are very small, hardly larger than new born puppies.

DEER SHEDDING THEIR HORNS.—Mr. Editor: I would like to say a word more on deer shedding their horns, or rather burying their horns. I have just read the article from "Sycamore," in the FOREST AND STREAM of March 14, also the letter of Mr. W. H. Cassell, where he positively asserts that they do bury their horns. I am just as positive that in this part of the country they don't. About two months ago I was hunting cattle and came upon a deer track. Following a cow-path, I soon came in sight of him feeding. I stopped, and he moved off over a hill. He had not seen me and was not scared. Before I got to where I had first seen him, I found one of his horns lying beside the path. It had apparently fallen off as he walked along. I found the other horn where he had been feeding. I have seen at least forty horns this spring, and all of them had apparently dropped off of their own accord, and my experience has been that where there is timber they avoid it as much as possible about shedding time. Might it not be possible that deer have different habits in different localities? I for one should like to hear more on this subject. PLAINSMAN.

Dismal Rancho, Neb., April 15, 1878.

WHAT A CRAPPIE IS.—Editor Forest and Stream.—Some time ago I noticed some questions from an Iowa correspondent concerning the crappie. I am not familiar with the (Ohio) State report referred to by your correspondent, and know next to nothing of the grass bass, but suppose him to be identical with the crappie (*Pomoxis hexacanthus*), of Cuvier, which is very abundant in the eddy and lake waters of the Mississippi River and its tributaries. It breeds in the lakes or lagoons of the low bottoms, and is very prolific. Its eggs are usually found in a glutinous mass attached to limbs and snags just below low water mark. In some parts of Mississippi the fish goes by the name of "tin mouth." In this vicinity, on account of a fancied resemblance in marking to the dominick fowl, it bears the name of dominick perch. It is a very superior pan-fish, weighing from one-half to two pounds. For further and full technical description of this fish, I refer your correspondent to "Norris' American Angler's Book," p. 111, where it is fully described under the names of Crappie, Sac-a-lac or Chincapin Perch. YELL.

Jacksonport, Ark.

[The crappie is also called a goggle eyed perch, a strawberry perch, chub (South Carolina), crappie (St. Louis), grass bass (Ohio), chinkapin perch (Louisiana), sac-a-lac (New Orleans creoles). See "Hallowell's Sportsman's Gazetteer," pages 378-9.—Ed.]

Snake Fascination.

MR. EDITOR—An article in a late issue of your most instructive paper, entitled "Snake Fascination," brings in relation to the same subject, an incident to mind which occurred two years ago, to which I was witness, and which may be of interest to some of your readers. About five o'clock one June afternoon, as I was hastening through the woods to regain my carriage, having just left the stream "where I was wont with line and hook to deceive the leaping fishes," my attention was attracted by hearing on my right the shrill, discordant notes, as those of a bird whose eggs or young are endangered. I stopped, and saw that at a distance of twenty feet, on a horizontal branch of a stunted apple tree, was seated a cat-bird, from whose throat the tones proceeded. It seemed in great distress, as, fluttering its wings and swaying its body to and fro, it repeated the plaintive cries which drew my attention to it. In all its seeming agony it moved not from

the limb, but clung to it as if it were its only protection. In wonder I gazed, but not long. A rustling in the leaves below drew my eyes from the bird. Slooping, I crawled nearer and nearer. I looked again, and on the ground, beneath the branch on which the bird was perched, was a black snake from two and a half to three feet in length, with body in close coil, head erect, and moving with an undulating, pendulous motion, tongue flashing and eyes riveted on its victim, only three feet above him. Again he rustled the leaves with his tail, and quickly withdrawing it, left but a small portion—perhaps three or four inches—out of the coil, which part he caused to vibrate with dazzling rapidity. The motion of its head increased. I fancied its eyes gained brilliancy in its eagerness. All this time the poor bird continued its cries and flutterings, but, as I watched, its struggles grew weaker, its flutterings less. It would sit for a time with drooping head and closed eyes, as though asleep, and then, as if suddenly awakened, would feebly raise its wings and utter a low, sad cry. At last these ceased, and the poor bird, after vainly struggling to retain its hold upon the limb, fell as if lifeless to the ground. Immediately the snake uncoiled himself and stretched out its head to grasp the bird. At that moment I killed him. I gently raised the bird from the ground, and, placing it in the palm of my hand, I could feel the violent pulsations of its heart, as with closed eyes and tightly clenched feet, it lay insensible. I carried it quite a distance before the first signs of consciousness appeared. Then a tremor ran through its body, its feet unclasped, its wings made a slight motion, its eyes opened, and, raising itself on its feet, it stood tottering. Then, as if endowed with new life and strength, it spread its wings and swiftly flew to its native woods. MISAL.

A HAMPERED DEER.

We present herewith an engraving of the deer's foot encircled by a ring of wood, which we referred to recently. The curiosity was sent to us by Mr. W. Kelleman, of Aberdeen, Miss., with the information that the deer so singularly

hampered was killed by a hunter near Winchester Station, Miss., on the M. and O. R. R. The growth of the hoof and of the toes leaves little room for doubt but that the specimen in its present shape is the growth of years.

ANIMALS RECEIVED AT CENTRAL PARK MENAGERIE FOR WEEK ENDING MAY 4, 1878.—One hog deer, *Cervus porcinus*, born in the menagerie; one opossum, *Didelphys virginiana*, presented by Mr. Geo. H. Pentland, N. Y. City; thirteen painted tortoise, *Emys picta*, presented by Mr. John Sutherland, N. Y. City; one gray squirrel, *Sciurus carolinensis*, presented by Mr. William Irving, N. Y. City; 12 pair fancy pigeons, presented by Mr. William R. Powell, N. Y. City.

A BIRD'S-EYE GLIMPSE OF TEXAS.

MEXIA, Limestone Co., Texas, April 7, 1878.

EDITOR FOREST AND STREAM:

Your remarks about Texas have induced me to write you a few lines. If you will spread your map of Texas before you, right in the middle of it you will see this county. It is easily approached, as the Houston & Texas Central R. R. passes through it, bringing you to this town with only one change from New York. It is in the cotton zone, and here that plant matures to perfection, whilst wheat is productive and certain, and corn almost a drug. Cattle in immense numbers dot the prairies, and horses are abundant and cheap. Narasoto Creek runs through the greater part of it almost north and south, affording good bottom lands and splendid timber. Game is abundant and in great variety. In the bottoms we hunt the bear and wildcat, with an occasional panther, and once in a great while the cougar strays from Mexico. The peccary, a wild hog, is still to be found in the impenetrable cedar brakes. Deer are more than numerous, doing great damage to the farmers, whilst the mule-eared rabbit (or hare) leaps up from under your feet while crossing the prairies, a perfect carpet of flowers in the spring. The grouse are also plentiful, and quail enough to gladden the heart of every true sportsman. Ducks and geese are also to be found in their season, though this winter our wild fowls have been scarce indeed. Woodcock none, and snipe but few.

The fishing is also good. Black bass (trout) very game and toothsome, and, in some streams, brook trout, though scarce. The scenery is lovely, being a rolling country, covered with rich grasses and starred with wild flowers. The climate healthy, as it lies almost 600 feet above the sea, and almost 200 miles from its shores. Sheep-raising is only beginning to be realized, as hitherto cotton has absorbed all minds (and well it might, were it not for wars in the Old World), but now it has become so unprofitable that many are turning their attention to wool raising, and truly for a man of small means nothing can pay better. Land is dearer here than in the west of the State, but this is compensated, as the products bring more, being nearer to market, and all necessities are cheaper. It is difficult to condense this letter within the limits of your

columns, and I must fain halt. If you desire more information I will gladly give it. The geese are going North; their honking is audible whilst writing this. The plover in myriads, and fat; very hard to approach unless in a carriage or wagon. I have lately killed many and eaten them, cooked as directed by "Elzeur Blaze" for snipe.

Quail shooting has afforded me much sport, though hard to point, as the running dogs, which are such favorites here, scent and chase them, which makes them shy. Still, a good bag can be made any day within sight of my house. The grouse are now packed and difficult to approach, but, driving in a light wagon over the prairies, a good number can be killed. I have seen a few snipe, but they are very wild. A party has just returned from a turkey hunt, some twelve miles from here, and brought with them five deer and seventeen turkeys. These last are in prime condition. The warm weather is coming rapidly, and the protracted flight of wild fowl without tarrying with us waru that spring has come.

GENERAL.

REGARDING SPRING FLOWERS.

EDITOR FOREST AND STREAM:

In your "Answers to Correspondents" you are incorrect on the "Alligator question." The sweet gum tree belongs to the order *Hamamelidaceae*, and to the species and genus of *Liquidambar styraciflua*. Secondly, among wild flowers are some inaccuracies: *Dicentra cucullaria* is Dutchman's breeches, while *Dicentra canadensis* is squirrel corn; also, *Thalictrum anemonoides* is not a Rue, but an Anemone, consequently it must be *Anemone thalictroides*, and not *Thalictrum anemonoides*. As to the mitre wort, it is many years since I have seen it, although it ought to be plentiful enough around here to be readily found. It differs from the *Tiarella*: one is the *Mitella diphylla*, mitre wort, and the other, *Tiarella cordifolia*, or bishop's cap. Also, may I add that for those who can enjoy looking at without handling, there is much to be found in our own Central Park, as my notes include my walks in the Park as well as on Long Island and New Jersey, although in the latter walks I carry a gun, which somewhat distracts my mind from botany. The *Cornus florida*, flowering dogwood, and *C. stolonifera*, red osier, are now in full bloom; the *Hamamelis virginica*, spice wood; *Lonicera sempervirens*, trumpet honeysuckle; *Cydonia japonica*, Japanese quince, and its companion, *Forsythia suspensa*. The *Forsythia* are very beautiful, although the frosts of March 25 and 26 have injured them some, and I fear that the magnolias and rhododendrons will make a poor show, while the hydrangeas will be a failure. C. B.

April 20.

[We are always happy to correct any inaccuracies or mistakes, and some of our correspondent's points are well taken. We acknowledge the corn, i. e., squirrel corn, and will be glad to hear from C. B. again, more especially as we purpose giving a monthly statement of the most prominent native flowers to be had in bloom. At the same time we pin our faith to "Gray's Manual," who says: "*Thalictrum anemonoides* (Mich.), Rue-Anemone; and we have always known *Forsythia viridissima* to be the hardy variety, *F. suspensa* being more tender and not so highly colored. The Dog-woods belong more properly to May, and will be noticed then; they are not in full bloom with us yet.—Ed.]

FLORIDA ORANGES—Mandarin, Fla., April 30.—This season's orange crop is gathered and marketed, and the results on the whole may be considered satisfactory to the grower. The golden fruit, much of it, hung a long time on the trees awaiting the discretion of the owner in regard to stripping, and as the prices showed marked improvement later in the season, those who delayed did not do so in vain. The orange is not fairly ripe until the latter part of November, and the quality of the fruit steadily improves on the tree if it be allowed to remain until the first of April. After that it deteriorates more or less, owing partly to natural decay and partly to absorption by the tree as it puts forth its new foliage and fruit. The blossoms break forth into fragrant bloom about the first of March; the petals soon fall from these and leave the tiny green orange formed in the centre, which day by day slowly adds to its size. It is a common thing to see the white blossoms on the tree intermingled with the ripe fruit, and it is not uncommon to see, later on, the small green fruit hanging side by side with the ripe. Thus graciously does the orange tree give a long time to try the market, keeping the oranges hanging sweet and fresh awaiting our pleasure, and overlooking our dilatoriness by driving ahead with the new crop, without reference to the old unpicker one on the trees. It is better, however, for the tree that the fruit should be picked before the new blossoms appear, for obvious reasons; and, if a fair price can be obtained, it is better for the proprietor, for there are risks to be run in keeping the crop until late in the season, which really entitles the owner to higher prices. December is a stormy month, in which high winds prevail, and by them many of the oranges are blown off, and, striking the ground, are bruised and thus rendered unfit for shipment. January and February bring occasional frosts, and these, if severe, will spoil the fruit and it will drop to the ground with the life killed out of it. These risks impel many to strip early in the season, and urgent need of money impels many more to do the same; while on the trees of those who can afford to wait and take their chances the fruit lingers late. Many fine trees have begun bearing this year, and thousands of orange seeds have sprouted into tiny trees, planted and tended by careful hands. One might think more trees were being raised than it would be profitable to use, but the orange business is in its infancy yet, and with more trees added to our groves we can gracefully come down to a lower price, if we have to do so in order to extend the market. C. D. D.

MAGNOLIA GRANDIFLORA.—The Magnolias are in bloom earlier this season than last by about ten days. A northern lady, an invalid, was saying a while ago, "O, I hope I shall see the magnolias bloom before I go home," and here they are before us. The trees are from fifty to sixty feet high, say the size of an oak or elm. The leaves are dark, glossy green, three inches by six, but some of the latest comers of leaves are a pale sea green and here and there in front of them the flowers are set. Is there any need of describing the flower? It is as white as the calla, as large as a dinner plate, and the exquisite scent from it reminds us of the lemon verbena, only it is far more abundant and diffusive. The buds are the size of a man's fist, with a beautiful form and taper, and silken softness to the touch. I picked a bud and flower for Easter Sunday and laid them on the little desk in the church, where

their pale beauty was even more apparent. Roses were in their company but they were dwarfed to daisies. Callas swung gracefully above them from vases, and while they equalled the Magnolia in color, the latter was larger and had more transparency to its whiteness—a sort of pale luminosity. I have written all this knowing full well that the magnolia is a well known tree and its flowers familiar; but I write of it as it is in Florida, where in development it exceeds its kind in other parts of the country.

The little steamer "Mary Draper" took down for me to Jacksonville this morning a bunch of five flowers, three being hardly opened. The captain swung it in the pilot house from the ceiling and it hung there swaying in the breeze, a bouquet fit for the gods, to say nothing of the steamboat passengers. I know what will become of it on its arrival. The friend to whom I sent it will place it in his doorway, and business men will turn their heads to look as they pass on, little children will stretch out their hands towards them, and ladies will stop many a moment to admire and exclaim with delight, as one did, a day or two since, "First magnolias!" Thus comes to us this season, the pride among flowers of every Southerner.

Mandarin, Fla. April 23, 1878.

C. D. D.

CENTRAL (MASS.) POULTRY ASSOCIATION.—This new association was formed at Worcester, Mass., April 30, with the following officers: Pres., Henry S. Ball, Shrewsbury; Vice-Pres., Rufus Holman, of Leicester, Lucius Morgan, of Worcester; Sec. and Treas., W. H. Fittin, Worcester; Auditor, F. A. Stratton, Worcester; Ex. Com., Henry S. Hall, of Worcester; W. E. Cunningham, of Fitchburg; G. F. Lawrence, of Worcester; H. Watts, of Worcester; Joseph Marson, of Princeton; J. G. Holland, of Worcester.

OPENING OF THE PARIS EXPOSITION.—The Paris Exposition opened May 2. Its attractions are thus summarized:

"The Exposition buildings are situated on both sides of the Seine, and are vast in their proportions, and both imposing and convenient in their architecture. One of the most interesting features of the exhibition is a Japanese village in a separate inclosure, where visitors will have an opportunity to study the exact manner of life of that interesting people. A Chinese pagoda has also been put up by native workmen. Holland will beautify the park of the Trocadero Palace with a bed of forty thousand Dutch tulips, and a vast aquarium will have a place there; a cascade, thirty feet in width, will fall over marble steps into a basin six hundred feet distant; great stretches of gardens, containing many hot-houses with rare plants, will lie to the right of the palace; two elaborate and beautiful fountains will throw their streams thirty feet into the air; a superb Algerian pavilion will adorn the grounds, and innumerable structures of varied architecture will be scattered about.

"The main building, situated on the Champ de Mars, is 2,000 feet in length by 1,000 feet in breadth. France will, of course, make the grandest show, but England also has made great efforts to have a representation which shall command admiration. Germany will not appear except in the way of paintings.

GEN. HARDING'S SALE OF YEABLING.—Gen. Harding's famous Belle Meade farm, near this city, with its large park of two hundred deer, model dwellings, outhouses, barns, stables, cowhouses, dairies, etc., all models of rural architecture, is the scene of an annual sale of fine blooded horses. At the sale last week some very fine stock was sold, but the prices ranged lower than on former occasions. There were twenty-five lots with an average of \$656 per lot. The highest prices paid was \$1,025 given by Col. W. H. Johnson, for Merry Lass, brown filly, foaled April 21 by John Morgan's dam Vesper Light (the dam of Vandelet), and \$795 for Chancellor, b. c., by John Morgan's dam Sadowna, by Jack Malone.

J. D. H.

The Kennel.

TO CORRESPONDENTS.—Those desiring us to prescribe for their dogs will please take note of and describe the following points in each animal:

1. Age. 2. Food and medicine given. 3. Appearance of the eye; of the coat; of the tongue and lips. 4. Any changes in the appearance of the body, as bloating, drawing in of the flanks, etc. 5. Breathing the number of respirations per minute, and whether labored or not. 6. Condition of the bowels and secretions of the kidneys, color, etc. 7. Appetite; regular, variable, etc. 8. Temperature of the body as indicated by the bulb of the thermometer when placed between the body and the foreleg. 9. Give position of kennel and surroundings, outlook, contiguity to other buildings, and the uses of the latter. Also give any peculiarities of temperament, movements, etc., that may be noticed, such as suffering, etc.

FIXTURES FOR 1878—BENCH SHOWS.

The Westminster Kennel Club (New York) Bench Show, Gilmore's Garden, May 14, 15, 16 and 17. Dr. W. Seward Webb, Secretary.

RAILROADS AND DOGS.

Mr. Editor: I would like to say a word upon the subject of "Railroads and Dogs," in continuation of an article in your valuable paper of the 18th inst.

I travel over the different railroads running out of Boston, with my associates, in the season for shooting, a great deal, and, with but one or two exceptions, we never had any trouble with the transportation of our dogs. But with one or two particular railroads we are very much abused by baggage-masters and brakemen, by extorting large fares for a short distance, and do not allow us to take care of them after we have paid their charges, but put them into a crowded baggage-car, between piles of trunks and cases, tolling about, liable to fall over at any time and kill or injure our dogs. We have often asked permission to sit in the baggage-car and look after them, after we have paid the charges, but are informed that we cannot, as it is against the rules of the road. At the same time there would be from six to twelve men, patrons or friends, sitting there, who commence fooling with the dogs at once as soon as they are left in their charge, getting them uneasy and discontented. We recently wrote to one superintendent about it, stating our case as clearly as possible, asking if we could not purchase a ticket for our dogs, and then either take them into the smoking or baggage car (not passenger car) under our own care, and rid ourselves of the abuse of employees who are vested with a little brief authority; but we got nothing favorable in reply, as he says that a

large number of their patrons object to dogs, partly because they are filthy and partly because they are liable to get bitten; also saying it is a custom for all railroads to do the same (which all sportsmen know different), referring to the Metropolitan Horse Railroad for example, as they refused to admit them. I would like, for one, to see this subject continued until some arrangement can be made with all railroads to transport dogs, either by giving them a proper place by themselves, or charging regular fare and leaving them with their owners, making them liable for all damages while being transported from one place to another.

Boston, April 27, 1878.

[We are in receipt of a great many letters fully indorsing our views as to railroad transportation. The principal question is this one—where the carrier receives no pay he incurs no risk. It is better, then, to pay for transportation of dogs, as it insures on the part of the carriers a certain positive amount of care, and if dogs are killed or injured through carelessness or willfulness of employees the company becomes liable. Nowadays, when a dog is worth as much as a horse, to have a dog killed and get no redress is contrary to all the rules of business and common sense.—ED.]

THE FOXHOUNDS AROUND GASTON.

EDITOR FOREST AND STREAM:

I can, without much trouble, give you the number of packs of hounds in this vicinity and within a circuit of twenty miles, taking my own house as its centre, which is on the Roanoke a few miles above Gaston. This county (Northampton, N. C.) is a marginal one. Its upper portion is adjoining that of Brunswick and Greenville, Va., and Warren, N. C. The Roanoke separates it from Halifax. It will be seen, then, that the proposed circuit will embrace parts of all these contiguous counties.

I shall begin with its centre. My own pack, the season just closed, consisted of nine couple, having presented a fine couple after its commencement. My pack, with a solitary exception, is Byron in a more or less degree. Below me is a neighborhood pack, each neighbor keeping a couple, and all uniting on hunting occasions, of some six couple. These hounds are of no uniform breed, but many of them have Byron in them. Summerill, near Gainsburg, has some seven couple of wild, ranting and traitless proclivities, but quite successful, with no traces of Byron in their blood. Mr. S. is now breeding to obtain it, and with the addition of several couple, which General Ransom, of the U. S. S., which he obtained through the kindness of Governors Bouie and Hampton, has loaned him. The next season will find him with a pack of note.

In Halifax, and just over the Roanoke opposite my residence, is a neighborhood pack of seven or eight couple, mostly Byrons, headed by Daniel C. Hardy. This pack is equal to any in the State, well trained and up to all duties. Above Mr. Hardy comes Nat Shewin heading another neighbor pack with a large infusion in it of the Byron blood. He usually has in the field six or seven couple. They are very sure and speedy.

Above Mr. Shewin, in the Roanoke and in the county of Warren is a very fine neighborhood pack, hunted by Mr. Rodwell, of eight or ten couple. These hounds are very pretty in action, I learn, but indicate pretty unmistakably the pointer strain. Mr. Russell, just above, has a pack of six or seven couple, represented to be pure runners. I hunted with a slut he sent W. E. Brodnax to have put up with one of his Byron dogs this season, and was favorably impressed with her action and general qualities, and think the Byron will neck well upon her.

Below Gaston, in Halifax, is a neighborhood pack of six or seven couple, headed by Captain E. E. Mosely. With the exception of two well-trained Byrons I gave him this season, his hounds have no Byron in them.

Near Weldon comes Messrs. Pope and Long's packs, which when united aggregate some ten or twelve couple. Those hounds are regarded very superior and very well bred. They have, however, no Byron in them, and how they would stand red foxes has never been tested. In the vicinity of Weldon only the gray fox is found. From Captain Mosely's to the mountains on the Roanoke both red and gray abound. The same is the case on each side of that stream, and as wide as it is the reds swim it when pressed.

In the county of Brunswick, Va., and six miles north of me, Mr. Basset Rawlings has a sure, reliable and game pack of six or eight couple. These hounds have (most of them at least) Byron in them, and some of them are nearly full Byron. I think this pack has been the most successful in killing the gray fox than any other of my acquaintance. But only his Byrons are fit for the red, in fact they won't run them. Just a few miles north of Mr. Rawlings F. E. Hoff and brother have three or four couple of mixed dogs, with no Byron interspersed. Some of them are fine gray fox hounds, but unless aided by Mr. Rawlings rarely succeed.

Mr. Ravenscroft Jones, on the Mahoning River, has a few couple of very fine hounds, mostly Byrons, which our mutual friend, W. E. Brodnax, gave him. Still further north, on the Nottaway and rather beyond my twenty miles' circuit, is Col. E. B. Tucker with a pack of diminutive beagles and Byrons combined, numbering seven or eight couple. They are nimble, quick and untiring, and just the thing for an old man after the gray fox. They are very musical, pack well, and afford splendid sport.

Clinton Harrison, a son of the late J. J. Harrison, who owned the famed racer Virginian and his dam Meatrix, hunts a neighborhood pack of seven or eight couple. This pack has in part a full share of the Byron stock and in part of Captain Epper stock of Dinwiddie county, Va. They are regarded fine dogs and very successful after the gray fox. They have not been fully tested after reds, but no doubt are well suited for that work. The past season they have been hunted well and constantly, with too unprecedented success. They are sturdy, speedy, true and untiring.

Some fifteen miles above me is the residence of W. E. Brodnax, who now owns and hunts the best pack of hounds within my circuit. They are mostly Byrons, and no fox, red or gray, can outbottom or outspeed them. I have been a huntsman for near forty years, and the manœuvring of his entire pack is superior to any I have ever owned or hunted; with the exception of one solitary dog, which a friend presented to him, his pack will hunt from morn till night without flag or slackening of pace. Mr. B. usually hunts some eight couple, though as his distributing puppies in the neighborhood has been so universal, he rarely hunts near home with so small a number.

I have in the above enumeration mentioned only packs of hounds. But the number of hounds of pure blood owned by individuals who never participate in the chase, fully equal

those hunted in packs. There is a famous pack also hunted by Mr. C. Harrison. These dogs Mr. Brodnax considers of good stock and high bred.

Before Gen. P. B. Starko distributed his pack among his friends, (and I am proud to say that the first choice and larger share was tendered me,) he had what we usually term a crack pack. These I have now in my pack are certainly first-class, and will compare with any hounds in this country.

T. G. T., of Gaston.

THE CHESAPEAKE BAY DOG.

In describing the Chesapeake Bay dogs at the Baltimore Bench Show, we spent considerable time over this class trying to understand them. The types of dogs were so different, when we came to look at the awards, that we were quite puzzled to know which form of dog was the best. At our request some of our friends in Baltimore where good enough to promise that they would give us their ideas as to what were the points of a Chesapeake Bay dog, and we take great pleasure in reproducing a letter from a gentleman thoroughly conversant with the Chesapeake Bay dog:

BALTIMORE, May 3, 1878.

In compliance with your request, I will endeavor to give you a description of the "Chesapeake Bay ducking dog," what in old times was called the "otter water dog." This dog is said to be, and believed by many to have descended from the offspring of the old Labrador dogs crossed with the otter (it being asserted that the otter will mate with a bitch when in heat and chained near his den). The truth of this theory I do not undertake to vouch for, but if the appearance, coat and performance of these dogs in the water go for anything, they certainly go a long way toward establishing the truth of this theory; but be that as it may, my purpose here is simply to describe the dog so that he may be recognized when seen.

A Chesapeake Bay dog's size, in point of height, should not be more than that of a fair sized setter, say about 23 inches, though he should be much longer in the body and shorter in the legs. Indeed, altogether differently shaped: weight should be about 60 or 65 pounds. I should be disposed to doubt his pedigree if he exceeded 70 pounds. In color he should be a very light liver, or between liver and yellow. His neck should be long, with head set on very much like an otter's. This head should be rather short and very decidedly tapering to the nose. His ears should be small and short and well set up toward the top of the head. The eyes should be mild and expressive, and in color and in keeping with his coat. Last, though not least, his hair should be very thick, short and perfectly straight, with perhaps just a slight disposition to be wavy or kinky over the loin, and next to the skin it should have a positive fur mixed as thick as possible with the hair. In short this dog seems to have been designed and fitted by nature in the best manner to bear exposure to the severest cold both of weather and water, his coat enabling him to come from the water almost as dry as when he entered it. His hair being straight and thick, he passes through the water with little or no resistance. It is almost impossible for the water to penetrate through the hair and fur to the skin, they necessarily can swim much more rapidly than a long or curly haired dog. No weather is too cold for them, and they will ofentimes live for a crippled duck and recover him while under the water. These dogs are generally very intelligent and of good disposition. One of the best specimens I've seen for many years was a bitch named Fan (No. 229) with several pups at our Baltimore Bench Show, she was in class 13 and took second prize. Her pups were exceedingly beautiful and very much like an otter.

OBSERVER.

THE NEW YORK DOG SHOW.—The success of this show seems now fully assured. The entries are already quite full, including 120 English setters, 100 red Irish setters, over 70 Gordons, and 100 pointers. The exhibition of true sporting dogs will be very complete. It must not be considered in the least as a show restricted to the metropolis. Fine animals from all parts of the country have been entered. It is not wise on the part of any one to endeavor to create jealousies in regard to a show if held in New York. We are sure that true sportsmen cannot have any narrowness of feeling. Shows in Boston, St. Louis and Baltimore have had the best dogs that New York possessed, and it is quite certain that there will be choice animals sent from the West to compete for the New York prizes. It is just out of the question that any one man, no matter how honest or competent he is, can always act as judge. There are idiosyncrasies of judgment which must be prevented. It would be unwise if, for two or three years, the same judge was to pass his dictum on all English or American dogs. There can be no special reason why one particular breed of dogs, or the offspring of a certain dog, should always take the laurels. If we want to lay down the law as to points, following closely the English taste, it is quite as well that we had Mr. Lort. We are positive that the decisions of Mr. Lort will be accepted as the judgment of a gentleman who has the fullest experience, and who, to his thorough knowledge, has gained the reputation of the most equal justice. It savors of bad taste to find any one who is inclined to cavil at decisions, even before they are promulgated. If any owners of dogs are fortunate enough to have prizes given their favorites, which dogs may have before this been accorded such awards, all we can say, then, is that the double distinction will be a most lasting one. Now we should not be the least surprised if Mr. Lort would in some cases decide on dogs as being the best at the coming show, which Mr. Davidson had also judged prior to this as winners.

In non-sporting dogs, in toys and pets, the show will be simply immense. There will be dogs good enough to cat—as the Chinese one—and some so small that a man with a moderate gullet could swallow one. There will be a big dog of 200 and odd pounds. The managers are very full of work, and as we commenced this article, sure of the success of the show, so are we convinced that it will surpass that of last year as to the entries of dogs, their excellence, and in the number of visitors who will attend the exhibition of the Westminster Kennel Club Bench Show.

BALTIMORE KENNEL CLUB AND THE FIELD TRIALS.—At a general meeting of the Baltimore Kennel Club, held on

the 24th of April, Edmond Orgill, Esq., in the chair, a discussion on the question of field trials, as suggested in a late number of the FOREST AND STREAM AND ROD AND GUN was held. Various subjects of interest were discussed by J. Addison Smith, Esq., President of the Baltimore Kennel Club, and by Messrs. Rowe, Higgins, Davidson, Preston, Sheppard and others. On motion of Mr. Whitford, it was proposed and carried that the 10th of November next should be the day for field trials. The President of the Baltimore Kennel Club kindly informs us "that in all probability the ground selected will be on the Rappahannock, some sixteen miles below Fredericksburg, the trials to be held by the B. K. C., who will also have gentlemen of the club to select the place at as early a day as possible."

NATIONAL DOG SHOW AT WORCESTER.—On May 21, 23, 23 and 24 a bench show will be held in Worcester under the auspices of several gentlemen. Mr. Charles Allen has been engaged, who will take charge of the dogs. There are in Division 1, for sporting dogs, free classes for champion English setters, for champion Irish, for champion Gordons and for champion pointers. In the open classes, there are 12 classes, for imported English setters or their progeny, 4 prizes; for native English setters, 4 prizes; for imported red or red and white English setters, 4 prizes; for native red and white setters, either Irish or cross-bred, 4 prizes; for black and tan, white and tan Gordons, either native or imported, 4 prizes; for pointers of 50 pounds weight or over, 2 prizes; for pointers under 50 pounds, 2 prizes; for pointer puppies under 12 months, 2 prizes; for retrieving and field spaniels other than pure Irish, 1 prize; for cocker spaniels, 1 prize; for fox hounds, best couple, 1 prize; for fox terriers 1 prize. In Division 2, non-sporting dogs, there are handsome prizes offered for mastiffs, St. Bernards, Newfoundlands, Dalmatians, collies, Italian grey hounds, bull dogs, King Charles spaniels, poodles, Siberian bloodhounds, pugs, black and tan terriers, Skye terriers, Yorkshire terriers. Entrance fee will be one dollar. The show will take place at Mechanic Hall. The prizes are fairly liberal, commencing with twenty-five dollars, the lowest being ten dollars. Mr. A. P. Peck is manager. Dogs will be received up to Tuesday, May 21. Entries will close May 15.

WORCESTER DOG SHOW.—Entries are coming in rapidly, and all indications are that, in number of dogs exhibited and general interest aroused, the show will be a decided success.

ENG.

FIELD TRIALS IN MINNESOTA.—In connection with the Minnesota Kennel Club Bench Show, which is to be held at the State Fair at St. Paul, next September, it is proposed to hold a series of field trials, and as the grouse season is just then at its best and the canine material of the State is of an excellent quality, a superior event may reasonably be expected. The English colony of Martin county, who keep up the fox hunting and hurdle racing of their native country, are to be present in full force at the fair and arrange a coursing meeting.

RUPTURE IN DOGS.—In answer to some inquiries made in the FOREST AND STREAM in regard to rupture or hernia in dogs, I will give my experience with my pointer pup. When first discovered the rupture was quite small and very soft. I used plasters and bandages for some four or five weeks, but could not discern any change in my dog. At last, disconsolate about my pup (for he is a fine little fellow), I went to a surgeon and asked him to perform an operation on my dog, which he did, successfully. The operation was only of fifteen minutes' duration, taking six stitches in the muscles of his abdomen, leaving the skin opened to heal afterward. I then placed a piece of heavy muslin around his body, making a bandage to lace at the top with rubber cord, and continued to dress him in this manner about once a week for six or eight weeks, when I was safe in removing the bandage. He has not been sick a day since the operation was performed. He is entirely well now, and is pronounced a daisy by all who have seen him.

Lafayette, Indiana.

TRACY.

A FIELD TRIAL WINNER FOR SALE.—Stafford, bred by L. H. Smith, Esq., of Strathroy, Canada, is to be sold. This fine dog was one of the field trial winners at Memphis. A better dog, with finer pedigree and recorded performances, cannot be met with.—[See advt.]

—The owner of a setter bitch, cream color, with orange ears, of small size, and answering to the name of Judy, was lost in Brooklyn some ten days ago. See the reward offered for her recovery, on her return to No. 80 Pierrepont street.

VISITS.—J. S. Jones' (Marshalltown, Iowa) dog Jet to Reno, owned by Dr. C. H. Field, Geneva, Iowa, April 2, and to Phoeby (out of Bismarek), owned by Sh pman.

State Centre, April 14.

VJ. W. Foster, Leesburg, Virginia, Kirby to Leicester; J. N. Dodge, Detroit, Rose to Leicester; and Isaac Fiske, Worcester, Mass., Pearl to Gladstone.

WHIRLS.—Baltimore, May 1.—Mr. J. Addison Smith's Lillie had a fine litter of pups, five dogs and five bitches, all white, with lemon markings. A choicer lot never was seen. Sire was Mr. Orgill's Flake, whose death we noticed in last week's issue.

MIRAL.—Mr. E. J. Robbins's Miral, Irish setter, whelped, April 25th, six pups, two dogs and four bitches, by champion Rory O'Moore, Weatherfield, Conn.

A REMOVAL.—Mr. W. Waldstein, the well-known manufacturer of optical instruments, has removed from his former store on Broadway to 41 Union Square, 17th street and Broadway. At Creedmoor everybody should have a good pair of glasses, and at Mr. Waldstein's establishment is the place to purchase them.

Game Bag and Gun.

MAY IS A CLOSE MONTH FOR GAME.

GAME IN MARKET.—RETAIL PRICES, POULTRY AND GAME.—Game—Wilson snipe, per doz., \$2.25; plover, \$2.00; bay birds, large, \$3.00; small, 30; wild pigeons, flights, \$1; do stall fed, \$2; Philadelphia squabs, \$2.50; wild do, \$1.

Poultry.—Philadelphia and Bucks County dry picked chickens, per pound, 25 cents; do., fowls, 18; do., turkeys, 18; do., ducks, 20; State and Western chickens, 15; do., turkeys, 15; do., fowls, 13; do., ducks, 10; spring chickens, 35.

CONNECTICUT.—Centre Brook, May 6.—Snipe shooting poor this spring. Too much water on the river meadows. Largest bag heard from, 12.

G. H. C.

MARYLAND.—Elkton, May 6.—Woodcock unusually abundant.

F. S.

GEORGIA.—Americus, April 27.—In some localities in the southern part of this State woodcock breed and remain all the year around. The country is open, except along the branches where the undergrowth is thick and land marshy. Deer are plentiful there, and if they were not shot down at all seasons of the year their numbers would afford grand sport. SNOR.

TENNESSEE TURKEYS.—"Forester," of Huntington, Tenn., thinks "Val's" reported 29 pounds turkey (F. and S., April 25) a wonderful bird. The average weight he puts at 19 pounds. What do our Tennessee turkey shooters have to say?

INDIANA.—Lafayette, May 5.—Chicken will be plenty unless season is very wet. Saw large numbers while shooting snipe. Found a nest on April 30, with ten eggs. This within 18 miles of Lafayette.

ASHLEY.

IOWA.—Pompey May 1.—Close season commences to-day. Golden plover have been quite thick for some time, but no Wilson snipe are to be found; have only bagged two this season. I was out last Saturday afternoon and killed forty plover, one curlew, etc. On going over the ground after the great storm of the 21st ult. I found numbers of ducks and other smaller birds that had met a violent death during the war of the elements.

ABE DACOTAH.

A MONTANA HUNTER'S LODGE.—Just what the poet meant when he sighed "for a lodge in some vast wilderness" we are at a loss to conceive. It certainly could not have been a hunter's lodge, for as this self-same poet wept bitter tears in good English rhyme upon the death of his pet hares, we cannot, by the boldest stretch of the imagination, think of him as mounted on a mustang, and, with shot-gun in hand, chasing the fleet jackass rabbit of the West. But the sportsmen of Helena, Ark., have a very definite conception of what will meet their needs. Having taken up a tract twenty-five miles north of Helena, near the summit of the main range of the Rocky Mountains, they propose to stock the lake with fish, build a club-house, and otherwise equip the grounds with the most approved appurtenances of a sportsman's park. The game, large and small, fur and feather, is abundant, and, with proper restrictions, will furnish rare sport for years to come.

A VETERAN SPORTSMAN.—The columns of the FOREST AND STREAM AND ROD AND GUN are frequently indebted to our very much esteemed friend, Dr. Garlick, for most interesting matter. In a late communication from Dr. Garlick he writes us: "I have to write lying on my lounge, and much of the time am suffering severely." We copy the following from the *Chagrin Falls (O.) Exponent* of April 18, which shows that the fire of former days still burns in the sportsman:

"Dr. Garlick, of Bedford, is a crack wing shot as well as expert angler, and although over seventy-three years old, a confirmed invalid, and unable to walk without the assistance of a crutch, he one day recently killed on the wing ten snipe out of eleven shots, each shot bringing a bird till the tenth, when, by more carelessness than lack of skill, he missed."

PORTABLE SHOOTING BOXES.—For several years we have been trying to induce builders to manufacture a portable shooting box or camping house which could be taken down or put up in a few hours, easily packed and transported, and sold at a cheap rate. Last year the Messrs. O'Brien, of Yonkers, advertised through our columns and received innumerable inquiries. Sportsmen did not, however, feel like paying the prices asked, and held off. This year the prices have not only decreased, but material improvements in construction have been contrived, and the Messrs. O'Brien are now prepared to suit all applicants.

What perfect structures of this kind can be made may be readily ascertained by visiting No. 51 Lafayette Place, New York City, where two models of the lightest, most graceful, durable and convenient kind are on exhibition. These are made by John M. Hoffmire, whose address is at 157 Broadway. The weight of a house 10x11 is only 600 pounds, and the cost \$120. A house with five rooms, suitable for the lake or sea side, costs only \$320, and weighs 1,650 lbs. The largest room is 10x16, and the other four rooms each 8x7. We verily believe that the time will soon come when the demand for these houses by shooting clubs, anglers, sportsmen and summer visitors on the sea side and in the mountains, as well as by fishermen, duckers, sheep rangers, cowboys, orange growers and pioneer settlers, will be almost as universal as the demand for canvas tents and blankets. We have critically examined the Hoffmire portable house with delight and fullest approval. It makes a man feel like putting out for the woods to step inside of one of them. These houses can be put up in two hours.

SMALL BORE GUNS.—Mr. Editor.—The inquiry of H. M. S. in FOREST AND STREAM of April 11, in regard to the desirability of 14-gauge guns for upland shooting, recalls Frank Forster's favorite for general use—a 14-gauge 8lb. gun. The

English makers are making 20-gauge guns that, with a charge of 2½ drachms of powder and ¾ of an ounce of No. 6 English shot (202 pellets), will make patterns of 165 pellets in a 30-inch circle at 40 yards. A circle 30 inches in diameter contains 706 square inches area, and, supposing the shot to be evenly distributed, 165 shot would give one pellet to every 4 square inches area, or place them about two inches apart. A 10-gauge cylinder bored gun could not approach this, either in pattern or penetration. If choked, the 10-gauge gun would make the same pattern, and the target would be increased in diameter 3 to 4 inches. This is the only advantage the large bore possesses over the small gauge for field shooting, when no one cares to use large shot. For large sizes of shot the large bores are best. For field use a 16-gauge, 6½ or 6¾ lb. gun, with a medium choke, will be found the best.

I own a muzzle-loading fine gun, made by Burke, of London, 15-gauge, 6½ lbs., cylinder bored, making a pattern of 125 pellets at 40 yards, 30-inch circle, with a charge of 2½ drachms of powder and ¾ oz. No. 8 American shot. A cylinder bored 10-gauge gun that will make a target of 140 pellets, using 3½ drachms of powder and 1½ oz. No. 8 shot, must be a good one. Now is the "game worth the candle?"—one drachm more powder and ½ oz. more shot to put 15 extra pellets in a surface of 706 square inches, or one extra pellet in every 47 square inches! Of course those who wish to cover the side of a barn had better use large bores with bell mouths. In selecting a gun all depends on what you want it for; if for cover shooting, a light small bore is all that is wanted, the right barrel a cylinder and the left medium choke; if birds are wild and long shots are the rule, have the right barrel medium choke and the left full choke. For a duck gun get an 8 or 10-gauge, for a flock gun the right barrel cylinder, the left medium choke. When ducks will not decoy well and are shy, have the right barrel medium choke and the left full choke. Where ducks are scarce and the shooting is at single ducks at long distances, have the right barrel full choke, and the left extra full choke. Small gauge guns will not shoot large shot so well as the large bores; on the other hand the small gauges are markedly superior to the large bores in shooting small shot. The choking of a gun enables it to shoot larger sizes of shot well.

TEN BROECK.

SOME PATTERN WITH A WEBLEY.—I send you the results of some experiments I made with my 12 bore Webley B L gun, at 5 O'Neil targets, 30 yards distant, and from the results I think they may prove of interest to those readers of FOREST AND STREAM who wish to secure the best possible results from their guns when shooting at either game, bird matches, glass balls, or targets. The conditions of the trials were as follows:

Targets, 30 in. circle, divided into 100 squares and parts of squares.

Shells, Hart's 2½ in. pickle cone, brass shells.

Loads, 3½ drachms Laffin & Rand's F. G. powder, 1½ oz. Colwell's drop shot No. 8, on powder, one P E wad and one fibre wad; on shot, one cut pasboard wad.

Gun, Webley, 12 bore, 32 in. barrel, 9½ lbs. weight.

Distance, 30 yards.

Target No. 1 with left barrel, had 288 shot in circle and hit 92 out of the 100 squares. Target No. 2, right barrel, had 304 shot in circle and hit 89 out of 100 squares. Target No. 3, left barrel, had 331 shot in circle, and hit 89 squares out of 100. Target No. 4, right barrel, had 310 shot in circle, and hit 80 squares. Target No. 5, left barrel, 284 shot in circle, and hit 85 squares.

In No. 1 and 2 targets I wet the shot with raw linseed oil, and the results are plainly to be seen in the very even distribution of shot over the face of target.

In targets No. 3 and 4 the shot was in the same condition as when it came from manufacturer. The result is shown by the uneven distribution, but larger number of shot in circle.

In target No. 5 I wet the shot with common lard oil; its effect is in my opinion not so good as in No. 1 and 2, but is better than in 3 and 4 targets. The question will then arise are these results peculiar to my gun, or will any gun show the same? I will test it if I have an opportunity some future time, but in the meantime will some of your readers make a few trials and give the results? I had no means of getting the penetration, so cannot give that.

CENTRAL.

Jersey City, May 7.

A GOOD, SERVICEABLE AND CHEAP GUN.—Now if any one had said that this season a good, serviceable gun, a central fire breech-loader, with patent top lever, direct bolted cam action, with a thorough lump, twist barrels, good locks and fore end, could be produced, imported from England and retailed at \$35, we could hardly have credited it. But so it is. The gun is now before us, and quite a neat shooting-iron it is, one that no one would be ashamed of. We put the barrels to the light, and the work seems perfectly smooth and finished as the sun shines through them. We click the locks, the snap sounds clear and good. We work the top lever, it moves smoothly and does not grate. Now, in order that persons may examine these guns before purchasing, Mr. H. C. Squires, of No. 1 Courtlandt street, agrees, on payment of express charges one way, to send any of these guns on examination. Of course they differ in prices; starting at \$35, they augment in cost to \$85, with Damascus barrels. Mr. Squires is well known for his probity and square dealing, and for those who want a good and cheap gun let them consult the advertisement.

ALTERING MUZZLE LOADERS TO BREECH LOADERS.—The question of altering guns is one so frequently asked us, that it is worthy of a careful consideration. A man has a favorite gun, one he has shot with for years, which in muzzle loading times, was the best of its kind. Is it worth altering? We have, we may frankly state it, been so far very much on the fence. Questions of safety being paramount, after that came the economic question. As to the first, we are quite sure now that when an arm has sufficient weight at the breech it can be so altered. We are even inclined to think that comparatively light barrels can be made into breech loading guns, because shells, if metallic ones are used, very much strengthen a barrel, affording an additional thickness against the bursting effects of powder. We may mention too, that when an old barrel is taken to a good workman to be looked over prior to changing to the breech loader, the metal has to go through a critical examination. It is not always that a barrel is returned because at the breech the metal is too thin, but because from long use, or for some oversight, it may be from the muzzle end that the barrel is worn out or poor. Now as to the question of cost. As a good breech loading gun can be had of American make at from \$50 to \$100, or an English one from about the same price up to \$125, when \$75 has to be paid for an alteration, the question of cost comes in, or is "the play

30 | tests.

ORION ROWING AND ATHLETIC ASSOCIATION.—This club, of Jersey City Heights, N. J., will hold their Second Annual Spring Games at West Side Driving Park, Marion, N. J., May 30, at 3 p. m., when the following events will be contested, open to all amateurs: One hundred yards run, one-mile walk, half-mile run, running high jump, 220 yards run, 120 yards hurdle race, quarter-mile run, three-mile walk, one-mile run, tug of war, 100 yards (club handicap) run. Gold medals to first and silver to second in each game, except tug of war, when silver medal will be given to each man of winning team. Teams to consist of five men. An entrance fee of one dollar per man for each game must be sent with all entries, to be returned to those who compete, except in tug of war. Color of handkerchief or cap and pants to be sent with entry. The right to decline any entry is reserved. Entries close positively May 20. Address, O. M. Taylor, Box 452, N. Y. City.

MYSTIC B. C. GAMES.—The spring Athletic Games will be held at Waverly Park, near Newark, May 25. The following competitions will be open to all amateurs: 100 yards and 220 yards hurdle, 440 yards, half-mile and one-mile runs and one-mile walk, all handicaps; throwing heavy hammer and running high jump. Also a novelty in the way of a "relay race" (two miles), which will be open to club teams of four men each, the prize to be an elegant silver goblet. In the first relay a representative from each team will start and run half a mile, and when each man crosses the score his place will be taken up by the next representative of his team, and so on, until the team shall have covered the two miles. In the handicap races the prizes will be gold, silver and bronze, to first, second and third.
